

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Nos certe, æterno veritatis amore devicti, viarum incertis et arduis et solitudinibus nos commisimus; et divino auxilio freti et innixi, mentem nostram et contra opinionum violentias et quasi instructas acies, et contra proprias et internas hæitationes et scrupulos, et contra rerum caligines et nubes et undequaque volantes phantasias, sustinimus; ut tandem magis fida et segura indicia viventibus et posteris comparare possemus. Quâ in re si quid profecerimus, non alia sane ratio nobis viam aperuit quam vera et legitima spiritus humani humiliatio.

BACON—*Instauratio Magna—Præfatio.*

For my own part at least, in obedience to the everlasting love of truth, I have committed myself to the uncertainties, and difficulties, and solitudes of the ways; and relying on the divine assistance have upheld my mind against the shocks and embattled ranks of opinion, and against my own private and inward hesitations and scruples, and against the fogs and clouds of nature, and the phantoms flitting about on every side; in the hope of providing at last for the present and future generations guidance more faithful and secure. Wherein if I have made any progress, the way has been opened to me by no other means than the true and legitimate humiliation of the human spirit.—*Spedding's Translation.*

POLITICAL ECONOMY.

ABBOT.

ABBOT, CHARLES, LORD COLCHESTER,—Born 14th October, 1757, at Abingdon, in Berkshire, was the second son of the Rev. John Abbot, D.D., Rector of Colchester. He was educated at Westminster, and Christ Church, Oxford, where he gained the Chancellor's medal for the Latin ode. He was called to the bar soon after 1783, and entered Parliament in 1795, as member for Hellesdon, in Cornwall, a nomination borough of the Duke of Leeds. He was a strong supporter of Mr. Pitt. He spoke pretty frequently, especially on financial subjects. In 1797 he was appointed chairman of the committee on the financial state of the nation, and prepared a great number of reports on that subject. In that year he carried a resolution that the statutes should be distributed much more extensively than they had been done. He strongly supported the principle that all income should be rated as it was found, without reference to particular cases, as, in fact, all other taxation, both direct and indirect, is levied. He moved for and obtained a committee to consider the neglected and disgraceful condition of the public records, and from this proceeded the Royal Record Commission, over which he presided till 1817. He warmly advocated the establishment of a general registration of all instruments affecting landed property. He said that this system had already prevailed for ages in Scotland with the happiest results, in Ireland for nearly a century with similar beneficial results, and in the two most populous counties of England, Yorkshire and Middlesex. It had been found to add a distinct and specific value to the property it secures. "Many recent events," he said, "had contributed to dissipate the prejudices which once hung on this question, and it now remains, only by transcribing one short and approved law, to extend the same benefits through-

ABEILLE.

out the rest of England." This was spoken in 1800, and in 1859 we are as far off as ever from such a benefit. The chief measure, however, of public interest with which his name is associated, is the establishment of the census of Great Britain. He brought in a bill for this purpose on the 19th November, 1800, and, in accordance with it, the first census was taken in 1801, and has been continued decennially since. In 1801 Mr. Abbot was appointed chief secretary to the Lord Lieutenant, and keeper of the Privy Seal of Ireland. On the 10th February, 1802, he was elected Speaker of the House of Commons, on the resignation of Mr. Mitford, and continued to hold that office till the 30th May, 1817, when ill health compelled him to resign. Though prevented by his office from taking part in the debates, he gave much of his attention and influence to the improvement and extension of parliamentary statistics, and he had opportunities of displaying his rhetorical talents in conveying the thanks of the House, on thirteen occasions, to the naval and military officers during the great war. His address to the Duke of Wellington, on the 1st July, 1814, was particularly admired. He was created a peer on the 3rd June, 1817, by the title of Baron Colchester, and died on the 7th May, 1829.

• **ABEILLE, LOUIS PAUL**—Born at Toulouse, 2nd June, 1719, was a member of the Society of Agriculture of Paris, and afterwards inspector general of the manufactures of France, and general secretary of the Board of Trade. He died at Paris, 28th July, 1807. He was an economist of the Physiocrate school, and of the most extreme opinions of that school.

ABSENTEEISM—The habitual absence of the landed proprietors of a country from their estates.

1. This expression arose out of the discussions on the miserable condition of Ireland; a very large proportion of the evils which afflicted it were attributed to the habitual residence of the greater part of its landed proprietors in foreign countries, where they spent their incomes.

2. The evils which resulted from absenteeism were alleged to be of two sorts, moral and economical. It was said that the habitual absence of the great body of the proprietors demoralized the lower orders by withdrawing the natural control over them; and secondly, it was alleged that the remittance of their incomes to so large an amount impoverished the country to that extent, and enriched the foreign country in which they were spent to an equal extent.

3. The entire question, therefore, is of a very complicated nature; but in the following remarks we shall not consider the moral part of it, but confine ourselves merely to the economical part. We do not contest for one instant the right of the Irish, or any other proprietors, to live where they like, or to spend their incomes where and how they please. The maxim that "property has its duties as well as its rights" may be a very excellent apothegm in morals, but it has nothing to do with Political Economy. And, in fact, in the state of Ireland thirty years ago, it was to be received with some qualification, when the chances were greatly in favor of any man who tried to live on his own property being shot. Men, we are afraid, will not pay much attention to moral maxims, when by doing so they will most probably be shot down like vermin. We shall, then, as we have said, restrict ourselves to the discussion of the simple question—Does absenteeism impoverish Ireland? And to guard the question, if possible, from any misunderstanding, it is not whether it is the same thing to the empire at large where the money is spent, but only whether it is worse for Ireland, and for Ireland alone?

4. To a plain person the proposition would

appear self-evident, that the exportation from a country of an article of value, which money is admitted to be, without any return to counter-balance it, would be a loss to that country. If an Irish landlord were to receive £10,000 as rent in cash, and then go off to Hong Kong, it would appear self-evident that there was a diminution of property in Ireland to the extent of £10,000. And when we consider the innumerable exchanges the circulation of such a sum may give rise to, by which profits are manifestly generated, it seems clear that the withdrawal of it from Ireland must be a loss to that country, and an equal gain to the place in which it is spent.

5. Nevertheless, a distinguished economist has undertaken to demonstrate the startling paradox that absenteeism is no loss, either morally or economically, to Ireland, or to any country. Confining ourselves to the economical part of the question, we shall now enquire how far Mr. McCulloch, the writer alluded to, is right in maintaining that the remittance of these rents, and their expenditure in foreign countries, is no real loss at all to Ireland.

6. That this proposition sounds paradoxical on the face of it Mr. McCulloch himself admits. That, however, is no argument against its being true. But the *onus probandi* certainly lies upon him who first starts a paradoxical proposition. Nevertheless, Mr. McCulloch affirms that no one who holds free-trade doctrines can doubt it, and that those who deny it commit the same error as the believers in the Balance of Trade. These are very startling assertions, and we shall now investigate the way in which he endeavours to establish them.

7. He commences by saying that he confines the discussion only to the spending of income, and the expenses necessarily connected therewith, and its outlay and consumption in housekeeping. He states that the rents remitted may amount to about three or four millions, and then he considers how they are remitted. "Now, as there is no excess of specie in Ireland, and Bank of Ireland notes do not circulate in England, it is obvious they cannot be remitted, except by exporting an equivalent amount of Irish raw produce, or manufactures. Were the absentees to return to Ireland there would be an increased demand for commodities or labor, or both, in the home market, to the extent of four or four-and-half millions, but that would be balanced by an equal diminution in the foreign market."

8. Again, he says, "It may be said that the rents of absentees are remitted neither in specie, nor in bank notes, nor in Irish produce, but in drafts on foreign merchants, or bills of exchange. But what, may we ask, is a bill of exchange? Is it not an order addressed to an individual residing in another part of the same, or in a foreign country, directing him to pay a debt he has already contracted, or is about to contract, to the drawer of the bill, to some other party specified by him. This, then, is the manner in which absentee expenditure operates. The agent of an absentee landlord, after collecting the rents of his principal, say £10,000, buys a bill of exchange with the sum from an Irish merchant, and the latter, in order to supply his correspondent in London, Liverpool, or Paris, on whom the bill is drawn, with funds to pay it, *must*, for it is in no respect optional to him, go into the Irish market,

and buy £10,000 worth of the raw or manufactured products of the country, and send them to the order of his correspondent. What, then, is the difference to Ireland, in so far as the demand for commodities is concerned, whether the landlord be resident or not?" "However it may be turned or twisted, it will be found, on analysing any case that may be presented, that this is the whole difference, in so far as expenditure is concerned, between a resident, and a non-resident landlord. The one exchanges his income for Irish commodities, or their equivalents, which he brings into his house in Ireland, and consumes them there, the other also, through the merchants who furnish him with bills, exchanges his income for Irish commodities, which, or the equivalents for which, he brings into, and consumes in his house in London or Paris. And, therefore, unless the mere locality of consumption be advantageous, it follows that the expenditure of that portion of the annual revenue of a nation which is sent abroad to absentees, contributes as effectually to the general advantage as the expenditure of any other portion of revenue." And then he ends this part by laying down this general proposition:—"It is never, in short, by sending abroad revenue, but by sending abroad the capital by whose agency revenue is produced, that nations are impoverished."

9. In this general proposition lies one of Mr. McCulloch's great fallacies. He maintains that if the revenue only be sent away, the capital is not diminished, and therefore the nation is not impoverished. But surely it is one of the best settled doctrines in Political Economy, that it is chiefly by the accumulation of revenue that capital is increased. If the whole revenue is swept away, the capital may not perhaps be diminished, but it cannot increase. If the revenue had been expended in Ireland, it would have increased the capital of Ireland, she would have possessed much more capital than she actually does, and surely that is equivalent to impoverishment. Sweeping away the revenue prevents the natural increase of capital. The revenue which is spent in foreign countries goes to increase the capital of those countries, and is lost to Ireland, to which it naturally belongs, and that is, to all intents and purposes, an impoverishment of Ireland. It may be perfectly true that it may not diminish the actually existing capital of Ireland, but the natural tendency of capital is to increase, and if it is prevented from becoming what it naturally would, it is an impoverishment.

10. But in unfolding his theory, Mr. McCulloch is soon betrayed into a striking instance of self-contradiction. He was met with the obvious argument that remitting rents to absentees was exactly similar to remitting tribute to a foreign prince. He says, "It is said, however, that these statements prove too much. That the same reasoning which shews that the remittance of rents to absentees is not injurious, will equally shew that a tribute may be paid to foreigners without injury to those who pay it. But the slightest reflection will convince any one that remittances to absentees are not identical with remittances on account of tribute, but totally and completely dissimilar. Suppose that a quantity of linen is exported from Ireland to Liverpool, on account of an absentee. If the absentee returns home, the

exportation will of course cease, but what will Ireland gain by the cessation? His rent may no longer be employed to purchase linen, but if not, it will be employed to purchase other articles, which he will of course consume in his own family; the fact of his being in Ireland or out of it, neither adds to, nor detracts from, the means of living possessed by other individuals. So long as those who consume, and the value of the products which they consume, continue the same, a change in the place of consumption affects themselves only. The case of a tribute is in every respect different. If the remittances to Irish absentees were put a stop to, those to whom they are sent would return to Ireland, and would consume them there. But if the same remittance were sent as a tribute to a foreign country, there would not, in the event of its ceasing, be any one to return to Ireland, and there would in consequence be so much additional wealth left in the pockets of its inhabitants. Nothing, therefore, can be more absurd and contradictory than the statements so frequently put forth by Irish newspapers and demagogues, comparing the remittances to absentees to a tribute, and complaining of the injury which Ireland sustains in sending abroad so large a sum for which she gets no return."

11. Bearing in mind the general proposition he had laid down, that sending away revenue and not capital, is no loss to a country, is it possible to have a more striking instance of self-contradiction? He admits that sending away tribute to a foreign power is a loss to a country, but tribute comes out of revenue, and he has just said that sending away revenue is no loss at all! The government commands the inhabitants to remit a certain quantity of money, that is a diminution of wealth. The landlords command the tenants to remit the same quantity of money, and that is no diminution of wealth; which shews that things that are equal to the same thing, are not equal to each other. He then says, that the distinction between the remittance of tribute and rent consists in this, that the absentees may return if the remittances of rent were stopped! But how does that affect the question so long as they do not return? Until the improbable contingency happens, the effects of the two must be manifestly similar.

12. In truth, if Mr. McCulloch's arguments were true, it is no disadvantage to a country, if the whole estates of the proprietary are entirely mortgaged; and this, no doubt, was one of the principal causes of the enormous remittances from Ireland. The sums due upon mortgage are evidently paid out of revenue, and, according to him, the sending away of these is no loss to the country. But does not the whole world rejoice that Ireland has got rid of her deeply encumbered proprietary? does not the whole world think it one of the greatest blessings Ireland ever received, and which will go far to atone for the calamities of the potato disease, that henceforth the land will be in the possession of a free and unincumbered proprietary? Now, if Mr. McCulloch's doctrine be true, it makes not the slightest difference to a country whether its proprietors are eaten up with debt, whether they be merely so many pauper units, or whether they be wealthy and unincumbered. It is certainly not necessary to waste argument in controverting such a doctrine. Mr. McCulloch stands solitary in such an opinion.

13. But, in fact, the radical error of Mr. McCulloch lies in only looking to the operation of obtaining the rent, and in not looking to what is done with it afterwards. Up to the time of the remittance of the rent no doubt it is immaterial. The difference arises afterwards, because the expenditure of that revenue increases the capital of the country. What is revenue to one man becomes capital to the next. The expenditure of that revenue makes no difference to the landlord, but it makes a very great difference to the tradesmen of all sorts in the neighbourhood. Their capital increases according to the business they do. No person can be so absurd as to deny that a tradesman's capital increases according to the profitable business he does. And of course the capital of the whole community must be the aggregate of the capitals of each individual. Now, if the £10,000 of rent be spent among the tailors, blacksmiths, carpenters, and tradesmen of all sorts in the neighbourhood, it increases the business of each, and therefore it adds to their capital, and they, in their turn, increase the business of their neighbours, and dependents, each in his own sphere. And thus by increasing the quantity of business of each, it increases production and capital.

14. Mr. McCulloch was again met by the assertion that the rents of the Irish landlords, if spent in Ireland, would benefit Irish tradesmen, for which every opulent individual must always have a demand, but that when they lived in London and Paris they employ them in paying the wages of English or French tradesmen, who consequently gain an advantage at the expense of those of Ireland. He pronounces this reasoning to be quite fallacious. "Suppose," he says, "any number of landlords residing at present, and laying out their incomes partly in English manufactures, goods, and colonial products, and partly in products of Irish art, and industry, emigrate to England or France, and *suppose further, that the identical Irish commodities, which they are in the habit of using in Ireland, are sent after them to their new residence.* In this case it is obvious, in the event of the absentees taking their servants along with them, that the wealth of Ireland would be in no degree affected by the change in their place of residence, and what in point of fact is the difference between the hypothetical case, and the actual case of the absentees from Ireland, or any other country? When the duke of Leinster leaves Carton, to establish himself in Carlton terrace, it is probable that the same articles may not be used by him in London, that he would have used had he continued in Ireland. *But if not, the difference is immaterial, for such of them as are of English or foreign origin, must be obtained directly, or indirectly, in exchange for an equivalent amount of Irish produce of some sort or other.*" Now, what a baseless proposition this last is! There is no necessity whatever that the articles bought in England must be obtained in exchange for an equivalent amount of Irish produce.

15. He then says, that absenteeism only changes the direction of labor, and that is all it can do. That produce and linen are the articles in which it is most to the advantage of Ireland to remit rents. And supposing them to return to Ireland, a less amount of their rents would be laid out in

these, and a larger amount in other things. But this would not occasion an increase of the total demand for labor, "*for, if under such circumstances, more people were employed in one way, fewer would be employed in another.*" Nay, Mr. McCulloch maintains that if the landlords were to return, the demand for labor would not be increased, but ten chances to one it would be diminished!

16. He acknowledges that the prevalent notions, on a superficial view, appear to be well founded. "When a wealthy landlord resides on his estate, there is generally, in some contiguous village, a number of little tradesmen, and manufacturers, who work on his account, and who, it is alleged, will be thrown out of employment and left wholly destitute in the event of his removing to another country. This statement is founded on an entire misapprehension of the nature of profits. Those who clamour against absenteeism, take for granted that retail dealers, tradesmen and manufacturers, live at the expense of those who employ them, and who buy their products. Certainly, however, they do no such thing. They are not so very dependent as they are believed to be by others and by themselves. *They are not maintained by the demand of the public, but by their own wits and industry.* Of these they cannot be deprived; and as they have supported them hitherto, they will support them in all time to come. The bootmaker who sells boots at fifty shillings, which cost him only forty shillings of outlay, does not make the ten shillings of profit at the expense of his customer. He produces in a given time a pair of boots equivalent to a worth in silver of fifty shillings, while the various expenses to which he is necessarily put in their manufacture amount when rated in the same medium to forty shillings, and his customers all do the same; they all make similar profits in their respective businesses, that is, they produce quantities equal to fifty shillings, by an outlay of forty shillings. Consequently, in exchanging corn, cloth, or silver, for boots, one party gains nothing at the expense of another. Profit is in every case the result of more being produced in given periods, than is consumed in them."

17. It may be perfectly true that neither party gains at the *expense* of the other, because each party wants what the other has; but how can the shoemaker's boots be worth fifty shillings unless some one will give him that price for them? If nobody will give fifty shillings for the boots, how can the shoemaker sell them? Is it not manifest that the shoemaker gains exactly in proportion to the number of boots he can sell? to the number of ten shillings he can make? To the number of exchanges he can effect? The shoemaker's wit and industry is worth nothing to him, unless somebody will buy his boots. This seems self evident, yet Mr. McCulloch goes on to say, "*It is a radical mistake to suppose that the idea that profits depend on exchanges is only partially erroneous, it is without even so much as the shadow of a foundation.*"

18. Is it necessary to say a word in answer to such a proposition? Seizing the old fallacy that one party gains at the *expense* of another in a commercial dealing, and attributing that to the supporters of this doctrine, which there is no foundation for, he quite overlooks the fact that both parties gain by an exchange, and the quan-

city of the gain depends on the number of exchanges effected. The fact is, his fallacy rests upon the idea that the simple labor adds to the value of the materials, an error which is the bane of Political Economy, because no labor can add to the value of anything, unless something can be obtained in exchange for it.

19. But says Mr. McCulloch, "The declaimers against absenteeism have yet another reason for the faith that is in them. They cry out—do you mean to say that Paris, Rome, and Brussels are not benefitted by the expenditure of English absentees? But if you admit that they are benefitted, must you not also admit that London and Bath derive a proportional benefit from the expenditure of Irish absentees? And if so, does it not follow that Ireland loses whatever they gain? While, however, we admit the premises, we deny the inference which it is attempted to draw from them. We concede that London and Bath are benefitted, though in a small degree, by the residence of Irish absentees, but we deny that Ireland loses what they gain, or that she, in fact, loses anything by their non-residence."

20. Now, by Mr. McCulloch's own reasoning, it follows that London and Bath equally benefit by the Irish landlords whether they live in London or Ireland, or Paris, as he says it is immaterial where they live, but he acknowledges, that by their being in London and Bath these gain. Therefore, the same thing is at the same time quite indifferent, and also better, for London and Bath.

21. Now, it will be seen that by Mr. McCulloch's arguments it would follow, that if the whole British aristocracy from the Queen downwards, and all the landlords were bodily to emigrate to Peking, and have the whole of their incomes remitted to them, it would be no loss to Great Britain! Nay, he says, that such a proceeding would probably give rise to a greater demand for labor, and that the presence of the landed proprietors only impedes industry in England. He says, that the presence of the landed proprietors in their own country impedes the industry of that country, but increases the industry of a foreign country in which they may reside; that their presence is injurious to their own country, but beneficial to a foreign country! So that the beneficial virtue appears to reside in their being foreigners. Surely the simple statement of such a paradox is its best refutation.

22. Mr. McCulloch has shown an inaccurate appreciation of the facts, when he says that the return of absentees would only change the direction of labor, and if there were more employed in one way, there would be fewer in another. Any one who knows anything of country districts, knows that country shopkeepers are totally idle half their time. Perhaps for several hours every day scarcely a customer enters their shop. Now, the presence of a wealthy proprietary gives them much more employment. But with an absentee proprietary, employment falls off, their business won't pay, and if they make no profits, they desert the country, and emigrate with the little capital they have to other countries. Thus their country loses both men and capital, in which wealth is usually supposed to consist. Consequently the remittance of all the revenue of a country, not only prevents the natural increase of capital, but causes a positive diminution, because

the existing capital does not meet with an adequate return. So far is it from being true, as Mr. McCulloch says, that profits are not made by exchanges, that it is by and through them alone, that profits are made.

23. Nor is Mr. McCulloch's attempt to demonstrate this proposition by means of the exchanges at all more successful. Consider it how we may, there must always be the remittance of the rent, without any return. The simplest case is the landlord receiving the rent himself and leaving the country with it, and whether he takes it himself, or has it sent to him, it must come exactly the same in the end. When Mr. McCulloch says that Irish produce is purchased to send to England to pay the rent, he forgets that when that produce is sold in England to obtain the rent, that rent does not come back. So that turn it which ever way we will, the ultimate result must always be the remittance of a large quantity of produce without any return. And because the simple operation may have an additional operation of an exchange superadded to it, that can make no difference in the final result. To suppose that it could, would be to affirm that if equal quantities be added to unequal ones, the totals are equal.

24. If Mr. McCulloch's argument were true, it would follow that if a band of pirates were to land in Ireland, and carry off a quantity of booty, that would be no loss to Ireland; or if a person were to enter a shop, and take away a quantity of money from the till, and afterwards come back again and buy a quantity of goods from the shopkeeper and pay him with his own money, that would be no loss to him. The former of these cases is an exact parallel to the simple remittance of rent, the latter is an exact parallel to the operation by means of the exchanges which Mr. McCulloch has brought forward. It is quite clear the ultimate result must be the same.

25. Mr. McCulloch says that his theory has never been answered, and concludes that "the clamor against absentee expenditure, is, in truth, as worthless as can well be imagined. It has no better foundation than the belief in witchcraft, or in *clairvoyance*, or in the efficacy of sham sinking funds." The foregoing observations will be found, we trust, to furnish an answer to it. The allegation that the common opinion involves the same error as the belief in the balance of trade is perfectly erroneous, because that fallacy is based upon the idea that money is the only species of wealth, which the opinion about absenteeism in no way whatever involves. So far from the common opinion being as absurd as a belief in witchcraft, it is unquestionably true, and Mr. McCulloch's theory is one of the most transparent sophisms that ever was put before the world.

ACCUMULATION—See CAPITAL and MONEY.

ACEVEDO, ANTUNEZ Y.—Member of the Supreme Council of the Indies.

Memorias Historicas sobre la legislacion y gobierno del comercio de los Espanoles con sas colonias en las Indias Occidentales. Madrid, 1797.

Mr. McCulloch states that this work contains much valuable information on the subject of the Spanish colonies.

ACHENWALL, GODFREY—Has the reputation of being the founder of the science of Statistics. He was born at Elbing, 20th October, 1719. He was educated at Jena, Halle, and Leipsick. In 1746 he settled at Marbourg, and taught history, public law, and statistics. In 1748 he went to Goettingen, and was soon afterwards appointed professor there, in which post he continued with great fame and success, until his death on 1st May, 1772. He travelled in several foreign countries, and published memoirs upon the constitution and political economy of each, which were much esteemed. He endeavoured to reduce to a systematic science the vital forces, the nature, the resources, and the means of prosperity of each. To this he gave the name of *statistics*, or the science of the state. His last work was *Observations on the Finances of France*.

ADAMS, JOHN QUINCY,—Was the eldest son of John Adams, the second president of the United States, and was himself the sixth. He was born at Quincy, Massachusetts, 11 July, 1767. In 1777 his father was appointed one of the commissioners to France, on behalf of the Americans, and took his son with him, who early displayed the most extraordinary powers, which were further brought out by the society of the eminent men with whom he came into contact. In 1781, at the age of 14, he was appointed private secretary to the American mission to Russia, and he discharged these duties to the perfect satisfaction of the envoy for 14 months; and then set off alone for the Hague, where his father was minister, to go to school there. He subsequently returned to the United States and studied at Harvard University, where he obtained distinguished honors, the authorities refusing all college fees in consideration of the eminent services of his father. He then adopted the profession of the law, but did not make much progress for four years. In 1793 the Union was greatly agitated with the question whether they ought to take part in the war which had broken out between France and England, after the execution of Louis XVI. Washington was strongly in favor of entire neutrality in all European quarrels; Genet, the French envoy, made the most passionate appeals to the people through the press, and the cabinet were divided on the question. Young Adams wrote a series of articles in the Boston papers, advocating a policy of neutrality, and discussed the principles of international law which affected the case, in so masterly a manner, that his letters created a great sensation, not only in America but in Europe. They were reprinted in England, and translated into French and German, and were generally attributed to his father. Washington esteemed them so highly that he immediately appointed him minister at the Hague. And when that country was so disorganized by the French invasion as to render such an office useless, he sent him to Lisbon, in 1796; and to Berlin, in 1797; and expressed his decided opinion to his father that he was the most valuable character the country had abroad, and the ablest of all the diplomatic corps. During his stay at Berlin he negotiated a very able treaty with Sweden, and in 1800 he made a tour in Silesia, and made himself thoroughly master of its economical condition. The results of his observations were published in a

volume in 1804, having previously appeared in a series of letters in a newspaper. He was recalled in 1801, as his father failed to be re-elected as President. He was then elected to the senate of Massachusetts, who sent him as their representative to the senate of the Union, and he held this office till 1808, when his opinion being contrary to that of the majority of his constituents on the neutrality question, which then vehemently agitated the Union, he resigned. In 1806 he had been elected professor of rhetoric and oratory at Harvard University, where his lectures were eminently successful.

In 1809 he was sent to Russia by President Madison, as the first United States minister to Russia, where he gained the high esteem of the Emperor, who through his influence subsequently offered to mediate between Great Britain and the United States. This did not succeed, but he was afterwards one of the commissioners who negotiated the treaty of peace in 1814 at Ghent. He was appointed minister to England in 1815, and negotiated a convention of commerce with that country. In 1817 President Monroe appointed him Secretary of State, and while he held this office he published his *Report on Weights and Measures*, in 1821.

In 1824 the Representatives elected him President out of a number of candidates, none of whom had the legal majority; and after the end of his term of office, he adopted the unprecedented step of being elected to the House of Representatives, in which he continued to sit for the remainder of his life. The two great questions of the day were protection and finance. He was placed by the Speaker at the head of the Committee on Manufactures. He was favorable to a moderate protection to manufactures, and also to the National Bank of the United States, whose utterly insolvent condition was not then known. Upon all these subjects he spoke and prepared reports of great value.

After Great Britain had emancipated her slaves in 1834, the question excited the warmest controversies in the United States, and it was after this period that the great fame of Adams as an orator arose. It was after his sixty-seventh year that his extraordinary powers burst forth with the most unexpected splendour, and for ten years continued with undiminished vigour, so that he acquired the popular name of the "old man eloquent." He was, during all this period, an ardent advocate for emancipation. He was struck by palsy in 1846, and died in 1848, at Washington.

He published a great number of short pieces, orations, &c., but his principal economical work is his *Report on Weights and Measures. Prepared in obedience to a resolution of the Senate of the United States, 3rd March, 1817*. Washington, 1821. This is a most valuable treatise on the whole theory of weights and measures, and their origin and history from the earliest times. He gives an account of the weights and measures of the Jews, the Greeks, the Romans, and then a very full history of those of England, with the acts of Parliament relating to them. He then gives a very full and valuable account of the origin and establishment of the French decimal system, which he does with a strain of declamatory fervour, which seems more congenial to Gallic than to Anglo-Saxon ears. The Report concludes

by an account of the metrical system of each State of the Union, and the laws affecting them.

ÆSCHINES SOCRATICUS—Was one of the favorite disciples of Socrates, who, indeed, said he was the only one who knew how to pay him proper respect. Some writers, on the authority of Suidas, attribute to him three dialogues, which are often printed along with Plato, but which are confessedly spurious, according to Diogenes Laertius. Modern critics pronounce them not to be genuine works of Æschines, without being able to assign them to any one else. One of them, *The Eryxias*, or, *About Wealth*, is, if the date attributed to it be true, the earliest treatise we have on an Economical subject. From the mention of the embassy to Sicily in it, Fischer assigns to it the date of 427 B.C. Whether we assign this dialogue to Æschines or not, is of very small importance, as it is manifestly of the Socratic school, and it is quite impossible to say that he did not write it. It is remarkable, however, not only as the earliest treatise on Political Economy, but for containing truths in the science, which are only just now beginning to be acknowledged, and which are far in advance of Adam Smith and Ricardo. That the sentiments are the genuine ones of Socrates, we are ready to believe, because we know no one else in antiquity, who was capable of perceiving the truths that he did. We shall give a pretty long extract from this dialogue, partly because it is so little known, and partly from the importance of the doctrine it maintains. The ambassadors having returned from Sicily, and discoursing on the subject with Socrates, mention that they had seen the wealthiest man in Sicily. This leads Socrates to a general discussion on the nature of wealth. The interlocutors at this part of the dialogue are Socrates and Eryxias. After some preliminary discussion, Socrates says:—

“And it remains to consider what wealth itself is, for if we do not know this first, we shall not be able to agree as to what evil is, and what good is. And I am ready to look into the matter along with you, as far as I am able. Let then the one who says that wealth is a good thing, say how the case stands.”

Eryx.—“But I do not, O Socrates, define wealth in any better way than others do. For to possess much money is to be wealthy. And I think that Critias here does not think wealth to be anything else.”

Soc.—“And yet, still this remains to be considered, what sort of money we speak of, that we may not soon afterwards appear to be at variance again. For instance, the Carthaginians use such money as this: in a small bit of leather is enclosed something as large as a stater, but what that is which is bound up, nobody knows, except the makers. Then, when it is sealed up, they use it as money. And he who possesses the most of these things, seems to have the most money, and to be the wealthiest person. But if any of us possessed the greatest possible quantity of this, he would not appear to be any the richer than if he had so many pebbles from the hill. And at Lacedæmon, they use a piece of iron as money, and this too, useless iron. And he who possesses a great weight of this iron, is esteemed wealthy, but in any other place its possession is worth nothing. And in Æthiopia they use carved stones,

which a Laconian could make no use of. But among the nomade Scythians, if any one possessed the house of Polytion, he would not be thought any more wealthy than if with us any one possessed Lycabettus. It is plain, then, that each of these cannot be property, if some of those who have them do not appear to be wealthier on this account. But there are some persons to whom each of these things is money, and those who possess them are wealthy, and to others they are neither money, nor are they any the richer for having them. Just as the same things are not good or base to all, but different to different persons. If, then, we wish to inquire why among the Scythians houses are not wealth, but they are so to us, or why among the Carthaginians skins are so, but not with us, or why among the Lacedæmonians iron is wealth, but not with us, should we not best discover the reason thus: for example, if any one at Athens should happen to possess a thousand talents weight of the stones in the market place, of which we make no use, is it that he would be thought wealthier on that account?”

Eryx.—“I think not.”

Soc.—“But if he happened to possess a thousand talents of the stone Lichnite, should we say that he was very wealthy?”

Eryx.—“Certainly so.”

Soc.—“Is it not for this reason, that one is useful to us, and the other useless to us?”

Eryx.—“Yes.”

Soc.—“And is it not the reason that houses are not wealth among the Scythians, that they have no need for a house? Nor would any Scythian prefer any house for himself, however beautiful it might be, rather than a sheep-skin cloak, because the one is useful and the other useless to him. So again, we do not think the Carthaginian money to be wealth, for we can acquire nothing that we want with it, as we can with silver, so that it is useless to us.”

Eryx.—“So it seems.”

Soc.—“Whatever then is useful to us, that is wealth, and whatever is not useful to us, that is not wealth.”

Eryx.—“How is this, Socrates? Is there not something we use in speaking to each other, and in inquiring and many other things? Are these then wealth to us, and in truth they appear to be useful. Not even yet has it appeared to us what wealth is. For nearly all of us agree that to be wealth, it must be something useful, but what sort of useful things, since it is not every kind of useful things which is wealth.”

Soc.—“Come, then, should we not rather investigate the question in this manner? What is that for which we use wealth, and for what object has the possession of wealth been discovered? As, for instance, drugs to remove diseases. For so, perhaps, it would be clearer to us, since it would necessarily appear that whatever happens to be wealth must be useful also. And of useful things, there is a certain species we call wealth. It remains to inquire for the sake of what use are the things which are called wealth to be used. For all things are to be called useful, which we make use of in some operations; just as all things which have life, are living things. But of living things, there is one kind which we call man. And if any one were to ask us, if we were free from what, should we not require the physician's art, or its

instruments, we should be able to say, that if diseases were driven away from our bodies, and did not all exist, or if existing, were immediately driven away. It seems then that medicine is the science which is useful for this purpose, to remove diseases. And if any one should again ask us, if what were removed from us, should we have no use of wealth, should we be able to say? But if not, let us again look into the matter. Come: if man could live without meat and drink, and was not hungry nor thirsty, is there any reason why he should want these very things, or silver, or anything else, that he might acquire them?"

Eyrz.—"I think not."

Soc.—"Are not other things then in the same way? For if we did not require for the service of the body, what we now want, both heat and cold, and sometimes other things, of which the body being in want, requires that which we call wealth, or utilities, would not be wanted by us. And if no one at all wanted any of these things, for the sake of which we now wish to possess wealth, in order that we may minister to the desires and the necessities of the body, for the sake of which we at any time want any thing. If then the possession of wealth is useful for this purpose, to minister to the wants of the body, if this should be taken away from us, we should have no use for wealth, and perhaps there would be no wealth at all."

Eyrz.—"So it seems."

Soc.—"It appears then to us, it seems, that those things which are useful to effect this purpose, are wealth."

He acknowledged that these were wealth, but yet the reasoning troubled him exceedingly.

Soc.—"But what are these kinds of things? Shall we say that the same things can be useful to the operations at one time, and useless at another?"

Eyrz.—"I should not say so. But if we have any want of the same thing for the same purpose it appears to me to be useful. And if not so, not so."

Soc.—"If then without fire we could work a brazen statue, we should not want fire for this operation. And if we did not require it, it would be of no use to us. And the same argument holds good with respect to other things."

Eyrz.—"It seems so."

Soc.—"Therefore of those things, which anything can exist without, none of them would be useful, at least for that thing."

Eyrz.—"Certainly not."

Soc.—"If then we should at any time appear to be able without silver, and gold, and other such things which we do not use for the body, as food and drink, and garments, and bedding, and houses, to satisfy the wants of the body, so as no longer to want them, neither silver nor gold, nor other such things, would be useful to us for this purpose, if it were able to exist without them."

Eyrz.—"They would not."

Soc.—"Nor would these things appear to us to be wealth, if they were not useful; but those things would appear to be wealth by which we could obtain what is useful to us."

Eyrz.—"O Socrates, I could never be persuaded of this, that gold and silver, and other things of this sort, are not wealth. For this I am firmly convinced of, that the things which are useless to us are not wealth, so that what is most useful to

us for this purpose is wealth. Yet I am not sure that these things do not happen to be useful to us for living, if by them we obtain necessities."

Soc.—"Come, then, how shall we settle this matter? Are there certain persons who teach music, and reading, or any other science, who obtain, in return for this instruction, the necessities of life as a remuneration for such things?"

Eyrz.—"Certainly there are."

Soc.—"Therefore, such men as these could make their living by such science, exchanging some of it for necessities, as we do for gold and silver."

Eyrz.—"I agree to that."

Soc.—"If, then, they gain by this means what they require for their living, this thing would be useful towards their subsistence. For we said that silver was useful for this purpose, that we are able by it to acquire what is necessary for life."

Eyrz.—"It is so."

Soc.—"If, then, these sciences are useful for this purpose, they appear to us to be wealth, for the very same reason that gold and silver are so, and it is plain that those who possess them are richer," &c., &c.

In this treatise, which is the earliest known to exist on the subject, are contained several of the fundamental conceptions of Political Economy. The author, for instance, saw clearly that value consists in exchangeability, and that all value is local, that is to say, that a thing may be valuable in one place and among some people, which is utterly valueless in another place, and among other people, and consequently that whatever has the quality of exchangeability possesses value, no matter what its nature is, or however small the sphere of its exchangeability may be. This principle is at the very root of Political Economy, and from its having been very imperfectly seen and developed, is one of the chief causes of the imperfect state of the science at the present day. For upon this doctrine the whole theory of the value of instruments of credit rests, which is, in our opinion, completely misconceived by the most eminent writers on Political Economy. (*ANNUITIES. CREDIT.*) Again, the writer of this treatise saw that each of the professions, and sciences, is a great estate, which produce utilities which are genuine wealth to the possessors of them. That intellectual wealth, in fact, is part of the national capital. The omission of this is one of the chief defects of Adam Smith and Ricardo, and it is one of the most conspicuous merits of the modern French school of Political Economy, at the head of which stands J. B. Say, to have thoroughly understood this principle, and made it an integral part of their system of Political Economy. Mr. J. S. Mill has also apprehended it, but not to a sufficient extent. (*CAPITAL.*) Upon the whole then, we see that this author not only clearly understood the fundamental conception of the science, but made such an advance in it, as Political Economists are only now beginning to understand.

AGAZZINI, MICHEL—

La science de l'Economie Politique, ou principes de la formation, du progrès, et de la décadence de la richesse, et application de ses principes à l'administration des nations. Paris and London, 1822.

AGIO.—Certain banks, such as those of Venice, Amsterdam, and Hamburg, were instituted for the purpose of securing a uniform standard of payment in mercantile contracts, and issued notes which were always exchangeable for a fixed quantity of bullion. The current money was usually deteriorated by wear and tear, and consequently the bank money was usually more valuable than the current money. The difference was called the *agio*, or premium. The name is likely to mislead, because it was evidently the current money that was at a discount, and not the bank money that was at a premium. As the difference, or *agio*, varied from time to time, it gave room for speculation, which was named *agiotage*, which is the French term for stock jobbing or speculating in the price of shares. During the suspension of cash payments by the Bank of England from 1797—1819, the market or paper price of gold was almost invariably somewhat, and for a considerable period, very greatly above the mint price, or bullion price. This difference corresponded to the *agio* on bank money, and has given rise, from the inaccurate language in which it was expressed, to the most protracted controversies, for it has always been called a rise of the market price of gold, whereas it is quite clear that it should have been called a fall in the value of the bank note, and then not one of these controversies would ever have arisen. There is a small *agio* at present between Bank of England notes and gold bullion. By law bank notes are demandable at the rate of £3 17s. 9d. per ounce of standard bullion, the difference of 1½d. between that and the mint price being supposed to defray the interest of the money during the time it takes to be coined at the mint. The word *agio* is also applied in France to the difference between the commercial or market relation of gold and silver and the legal relation. (BANKS OF VENICE, AMSTERDAM, HAMBURG.)

AGNES, J. A.—Doctor of Laws, and Advocate at Saint Brieuc.—

De la Propriété considérée comme principe de conservation, ou de l'hérédité. Paris, 1840. 2 vols.

It contains an historical account of the origin and modification of the rights of property in different stages of society. G.

AGOULT, CHARLES CONSTANCE CESAR LOUP JOSEPH MATHIEU D'—Born at Grenoble, in 1747, nominated Bishop of Pamiers, 13 May, 1787, resigned in 1801, and died at Paris, 21 July, 1824. A writer on a great number of different subjects. Those relating to Political Economy are—

Projet d'une banque nationale, ou moyen de tirer de France la crise actuelle. Paris, 1815.

Eclaircissement sur le projet d'une banque nationale, et réponse aux objections faites contre ce projet. Paris, 1816.

Des impôts indirects et des droits de consommation, ou l'essai sur l'origine et le système des impositions Françaises, comparé avec celui de l'Angleterre. Paris, 1817. G.

ALAUZET, FRANÇOIS ISIDORE—Born at Alexandria, in Sardinia, in 1807. Head of a department in the Ministry of Justice.

Traité générale des Assurances. Assurances maritimes, terrestres, mutuelles, et sur la vie. Paris, 1844, 2 vols. G.

ALBON, CLAUDE CAMILLE FRANÇOIS D'—The lord of Yvetot, in Normandy, was born at Lyons, in 1753. He passed his life in travelling and writing, and was member of several learned Academies. His works are on a great variety of subjects, especially political and agricultural. He was an ardent admirer of Quesnay, and his school of Political Economy. He died in 1789. His works relating to Political Economy are—

Observations d'un citoyen sur un nouveau plan d'impositions. Amsterdam and Paris, 1774.

Eloge de Quesnay. Paris, 1775.

ALES, PIERRE ALEXANDRE D'—Viscount of Corbet, of an ancient family in Touraine, was born 18 April, 1715. Entered the army at 18, and served on land and at sea till 1741, when he retired from ill health. He then devoted himself to literature and agriculture, and adopted the doctrines of the Economists. The time of his death is unknown. Of his numerous works on moral philosophy, history, politics, and agriculture, the one that chiefly relates to Political Economy is—

Nouvelles observations sur les deux systèmes de la noblesse commerçante ou militaire. Amsterdam, Paris, 1758.

ALGAROTTI, FRANCESCO—The son of a wealthy Venetian merchant, was born at Venice, 11th December, 1712. He studied at Rome, Venice, and Bologna. He was celebrated for his various acquirements in a great number of different sciences, though he cannot be said to have attained the highest eminence in any. His great merit was in rendering science popular among the upper classes. He early travelled to Paris and London, where he met Lord Baltimore, who invited him to accompany him to St. Petersburg. Having afterwards gone to Germany, he became acquainted with Prince Frederick of Prussia, who was so pleased with him that immediately after he came to the throne, he invited him to Potsdam. Algarotti accepted the invitation, and remained there till nearly the close of his life. Frederick created him a Count, and made him his chamberlain. Finding, however, the climate too severe for him, he returned to Italy, and devoted himself to the publication of his works, and the study of the fine arts. He died at Pisa, 3rd May, 1764. His writings on a great variety of subjects, are very numerous, those relating to Political Economy, are—

Travels in Russia, with the history of the metals of that country.

Saggio sopra il commercio, con alcuni Framenti Economici.

Published in Custodi's collection of the Italian Economists. J. B. Say and Blanqui speak highly of Algarotti's Economical works.

ALISON, ARCHIBALD, SIR, BART.—Son of the Rev. Archibald Alison, born at Kenley, in Shropshire, his father's vicarage, 29th December, 1792. He was educated at Edinburgh, and

called to the Scotch bar in 1814. In 1828 he was appointed sheriff of Lanarkshire, in 1851 elected Rector of Glasgow University, and D.C.L. of Oxford. In 1852 he was created a Baronet by Lord Derby. Sir Archibald Alison's reputation principally depends upon his *History of Europe from 1789 to 1815*. The economical discussions in that work, and its continuation, would fill a moderate sized volume. His separate works relating to Political Economy, are his—

Principles of Population. 2 vols. Edinburgh. 1840.

England in 1815 and 1845. Edinburgh. 1846.

Free Trade and a Feattered Currency. Edinburgh. 1847.

And a number of essays originally published in *Blackwood's Magazine*, and republished in 3 vols. 8vo. 1850. Those relating to Political Economy are—

The Commercial Crisis of 1837. *Free Trade and Protection*.—*The Navigation Laws*.—*The Crowning of the Column and the Crushing of the Pedestal*.—*Free Trade at its zenith*.—*Direct Taxation*.—*Free Trade, Reform, and Finance*.

ALLARDYCE, ALEXANDER, M.P.

Address to the Proprietors of the Bank of England. London. 1798.

ALLOY.—The precious metals, gold and silver, in their native state, are much too soft to be capable of being used as coins, or any other instruments. It is, therefore, necessary to mix them with a certain portion of harder metal, which is called alloy. By a curious and universal law in chemistry, the mixed metal is harder than either of its constituents. Copper is the alloy used in the British coinage, and the proportion in the gold coinage is eleven parts of pure gold to one of copper; or, as the purity of gold is measured by twenty-four aliquot parts termed *carats*, standard gold is said to be twenty-two carats fine. The proportion in silver is that used since the days of William the Conqueror; it is eleven ounces two dwts. fine to eighteen dwts. alloy, and for centuries it has been called the "Old right standard of England." It has been found by experience that these proportions confer the greatest amount of durability on the coinage. The French with their love of the decimal system, have carried it into their coinage, which is nine parts fine, and one part alloy, but its durability is inferior to that of the British coinage.

ALPHONSE, LEWIS.—Born at Bordeaux, March 10, 1743. A chemist of an enthusiastic turn of mind, an ardent revolutionist, and a disciple of Mesmer. His love for politics having destroyed his business, he retired to Dax, and turned his attention to agriculture. He returned to Bordeaux in 1799, and died February 2, 1820.

Mémoire sur la monnaie de billon.

AMEILHON, HUBERT PASCAL.—A member of the Academy, and Librarian of the City of Paris for thirty-eight years, and of the Arsenal for fourteen years, was born at Paris, August 5, 1730. He became an ecclesiastic, and wrote a considerable number of works. In 1766 he was admitted a member of the Academy of Belles Lettres, on writing his *History of the Com-*

merce and Manufactures of the Egyptians. In 1779 he founded, along with Roubaud, the *Journal d'Agriculture, Commerce, Arts et Finances*. He was elected member of the Constituent Assembly, and an ardent revolutionist. He was one of the commissioners on monuments, and for the examination of the titles to nobility, and several other revolutionary committees of great violence. In the course of his official duty he caused to be destroyed 652 volumes of original documents relating to the titles and armorial bearings of the French noblesse and French history, and all sculptures, monuments, statues, and other works of art which bore the ensign of the French royalty. On the other hand, he saved and gathered together the libraries of the suppressed convents, and collected 800,000 volumes, among which were the libraries of Malesherbes, Lavoisier, and several other persons of note, which were afterwards restored to the proper heirs of their owners. He devoted six or seven years to classify and arrange the books so acquired. When France settled down under the sway of Napoleon, Ameilhon resumed his literary labours, and on the creation of the Institute, he was elected a member of the department of history and ancient literature. Besides his *History of Ancient Commerce*, he wrote—

Sur la Métallurgie.

Sur la Pêche des Anciens.

ANDERSON, ADAM.—Born in Scotland in 1692. He came to England, and obtained a situation in the South Sea House, where he remained 40 years, and rose to be chief clerk of the stock, and new annuities. He labored for many years at his *Historical and Chronological Deduction of Trade*. 2 vols. folio. London, 1762. Though a work of great labor, it is in many respects very inaccurate, and the author is infected with many of the old exploded fallacies in Political Economy, such as the Balance of Trade, a delusion, however, which continued to blind many much greater authorities to a much later period, and therefore we must not blame him too much. In other respects his views were more liberal and enlightened. His work is better known under the name of Macpherson's *Annals of Commerce*. This author having rewritten the earlier portion of it, and amended the latter, published it with a new title, and under his own name (MACPHERSON.) Anderson died in 1765.

ANDERSON, JAMES, LL.D., F.R.S., &c.—One of the great improvers of British agriculture, was born at Hermiston, about six miles from Edinburgh, in 1739. He was the son of a small farmer, and was left an orphan at fifteen. Against the advice of his friends, he determined to manage his paternal farm, but upon reading Home's *Essay upon Agriculture*, he found he could not understand it without a knowledge of chemistry. He accordingly went to Edinburgh to attend the lectures of the celebrated Dr. Cullen, with whom he formed an intimate friendship, which lasted till his death. In 1763 he left his native farm, and took one in the wildest part of Aberdeenshire. It was named Monkshill, of about 1,300 acres, and almost in a state of nature. In his efforts to reclaim this farm, he turned his attention to planting, and similar subjects, and began to contribute a series of articles

on these operations to an Edinburgh magazine, under the signature of Agricola. In 1768 he married Miss Seton, of Mownie, and acquired that estate in right of his wife. In 1780 the University of Aberdeen conferred upon him the degree of LL.D. In 1783 he removed to Edinburgh, for the education of his children, and having written a pamphlet on the Northern Fisheries, the government employed him to make a survey of the Western Highlands and Islands. In 1797, he removed to Isleworth, near London, and in March, 1799, commenced the publication of his *Recreations in Agriculture*, which he continued until April, 1802. His health after this broke up, and he died, 15th October, 1808.

He was the inventor of the two-horse plough, without wheels, to which, more than to any other single cause, the immense progress of Scottish agriculture is due. He was the author of a great number of articles and papers, especially on all matters relating to agriculture, and his writings exercised a great influence in advancing its knowledge and cultivation. He was elected a member of the Royal Society, and a great many other learned bodies.

However great his merits and usefulness might have been in his own day, Anderson's chief claim to interest at the present time is, that he was the originator of the idea that Rent springs from the unequal fertility of different soils, which is the basis of Ricardo's famous theory of Rent. Adam Smith had laid it down that high rent was one of the causes of the high price of corn, from which it naturally followed that if the landlords gave up their rents, corn would be so much lower. In 1777 a new corn bill was brought into Parliament, and Anderson wrote a pamphlet called "*An Inquiry into the Nature of the Corn Laws, 1777*," for the purpose of advocating a sliding bounty. In the course of this, he shews the entire fallacy of Adam Smith's idea that the payment of rent influenced the price of corn. He shews that the price of corn depends entirely upon supply and demand, and that all the variations in price are caused by a change in the relation of supply and demand. He shews well that rents entirely depend on the price of corn, and that any rise in the price would only temporarily benefit the farmer, but ultimately it would entirely go to the landlord.

In a note at page 46 of this pamphlet, he broaches his theory of Rent, which we quote here, and shall comment upon, together with Ricardo's and other theories.—(RENT, RICARDO.)

"It is not, however, the rent of the land that determines the price of its produce, but it is the price of that produce which determines the rent of the land; although the price of that produce is often highest in those countries where the rent of land is lowest. This seems to be a paradox that deserves to be explained.

"In every country there is a variety of soils, differing considerably from one another in point of fertility. These we shall at present suppose arranged into different classes, which we shall denote by the letters A, B, C, D, E, F, &c., the class A comprehending the soils of the greatest fertility, and the other letters expressing different classes of soils, gradually decreasing in fertility as you recede from the first. Now, as the expense of cultivating the least fertile soil is as great, or greater, than that of the most fertile field, it

necessarily follows, that if an equal quantity of corn, the produce of each field, can be sold at the same price, the profit on cultivating the most fertile soil must be much greater than that of cultivating the others, and as this continues to decrease as the sterility increases, it must at length happen that the expense of cultivating some of the inferior classes will equal the value of the whole produce.

"This being premised, let us suppose that the class F includes all those fields whose produce in oatmeal, if sold at 14s. per boll, would be sufficient to pay the expense of cultivating them, without affording any rent at all. That the class E comprehended those fields, whose produce, if sold at 13s. per boll, would free the charges, without affording any rent, and that, in like manner, the classes D, C, B, and A consisted of fields, whose produce, if sold respectively at 12, 11, 10, and 9 shillings per boll, would exactly pay the charge of culture, without any rent.

"Let us now suppose that all the inhabitants of the countries where such fields are placed could be sustained by the produce of the first four classes, viz. A, B, C, and D. It is plain that if the average selling price of oatmeal in that country was 12s. per boll, those who possess the fields D could just afford to cultivate them without paying any rent at all; so that if there were no other produce of the fields that could be reared at a smaller expense than corn, the farmer could afford no rent whatever to the proprietor of them, and if so, no rents could be afforded for the fields E and F, nor could the utmost avarice of the proprietor, in this case, extort a rent for them. In these circumstances, however, it is obvious that the farmer who possessed the fields in the class C could pay the expense of cultivating them, and also afford to the proprietor a rent equal to one shilling for every boll of their produce; in like manner the possessors of the fields B and A could afford a rent equal to two or three shillings per boll of their produce respectively. Nor would the proprietors of these fields find any difficulty in obtaining these rents, because farmers, finding they could live equally well upon such soils, though having these rents, as they could upon the fields D, without any rent at all, would be equally willing to take the one as the other.

"But let us again suppose that the whole produce of the fields A, B, C, and D, was not sufficient to maintain the whole of the inhabitants. If the average selling price should continue at 12s. per boll, as none of the fields E and F could admit of being cultivated, the inhabitants would be under the necessity of bringing grain from some other country, to supply their wants. But if it should be found that grain could not be brought from that other country at an average under 13s. per boll, the price in the home market would rise to that rate, so that the fields E could then be brought into culture, and those of the class D could afford a rent to the proprietor, equal to what was formerly yielded by C, and so on of the others; the rents of every class rising in the same proportion. If these fields were sufficient to maintain the whole of the inhabitants, the price would remain permanently at 13s., but if there was still a deficiency, and if that could not be made up for less than 14s. per boll, the price would rise in the market to that rate, in which

case the fields F might also be brought into culture, and the rents of all others would rise in proportion.

"To apply this reasoning to the present case, it appears that the people in the Lothians can be maintained by the produce of the fields A, B, C, D, and E, but the inhabitants of Clydesdale require also the produce of the fields F, so that the one is under the necessity of giving at an average one shilling per boll more for meal than the other.

"Let us now suppose that the gentlemen of Clydesdale, from an extraordinary exertion of patriotism, and an inordinate desire to encourage manufactures, should resolve to lower their rents, so as to demand nothing from those who possessed the fields E, as well as those of the class F, and should allow the rents of all the others to sink in proportion. Would the price of grain fall in consequence of this? By no means. The inhabitants are still in need of the whole produce of the fields F as before, and are under the necessity of paying the farmer of these fields such a price as to enable him to cultivate them. He must, therefore, still receive 14s. per boll as formerly, and as the grain from the fields E, D, C, B, and A are at least equally good, the occupiers of each of these fields would receive the same price for their produce. The only consequence, then, that would result from this Quixotic scheme, would be the enriching one class of farmers at the expense of the proprietors, without producing the smallest benefit to the consumers of grain, perhaps the reverse, as the industry of these farmers might be slackened by these measures.

"If, on the other hand, by any political arrangement the price of oatmeal should be reduced from 14s. to 13s. per boll, it would necessarily follow that all the fields of the class F would be abandoned by the plough, and the rents of the others would fall of course, but with that fall of rent the quantity of grain produced would be diminished, and the inhabitants would be reduced to the necessity of depending on others for their daily bread. Thus it appears that the rents are not at all arbitrary, but depend on the market price of grain, which in its turn depends upon the effective demand there is for it, and the fertility of the soil in the district where it is raised, so that the lowering of rents alone could never have the effect of rendering grain cheaper."

This passage is remarkable as being the first elaborate attempt to explain the theory of rent, but it is manifestly defective because it assumes the necessity of there being different degrees of fertility in the soil of the country. This supposition is entirely superfluous, because rent would arise, even though all the soil was of exactly the same fertility. Ricardo greatly extended it afterwards, by shewing that there were other circumstances which were equivalent to differences of degrees of fertility. But the great merit of this passage is the final and conclusive answer it gives to the popular notion, that if landlords went without their rents, corn would be any the cheaper. It is not possible to demonstrate this in a more conclusive manner than is done in the preceding passage, and it is of great service in Political Economy, but this and a few other passages are the only ones of any value in this pamphlet.

Although the country owes much to Anderson

for his services in favor of agriculture, his speculative notions were founded on the exploded fallacy, that it is necessary or advantageous for a country to be independent of all foreign nations for a supply of food. It was exactly the same idea that was at the root of the Protective System, which was abolished in 1846, only that system was based on the method of a sliding scale of import duties; Anderson's was a sliding scale of bounties on exportation. Both had the same object in view, to secure the farmer such an average price of corn as would encourage a sufficient supply to be grown at home so as to be independent of foreigners. This fallacy is now exploded, because it is now well known that it is much more advantageous for a country to purchase its corn from foreigners by means of its manufactures, than to pay an enormous tax to home producers. That foreigners will refuse to sell, is a mere bugbear that all experience disproves. Buyers and sellers come together with an electric force that nothing can resist. In fact, producers have the same necessity to sell, which consumers have to buy. The fallacy which pervades Anderson's and the protective system is the identical one which beguiled Adam Smith on the subject of the Navigation laws, which have recently been repealed with such excellent results. The Board of Northern Fisheries was instituted on Anderson's principles, but the fallacy of the bounty on herrings being clearly shewn, it was long ago repealed, and the Board's duties are now confined to dispose of an annual grant of £3,000 a year for the extension and improvement of harbours for the fishermen on the coast of Scotland.

Anderson's other works relating to Economical subjects are as follows:—

Observations on the means of exciting a spirit of National Industry. Edinburgh, 1777.

An Enquiry into the nature of the Corn Laws. Edinburgh, 1777.

Essays relating to Agriculture and Rural affairs. Edinburgh, 1777. Fifth edition 1800.

An Enquiry into the causes which have hitherto retarded the advancement of Agriculture in Europe. 1779.

The true interest of Great Britain considered: or a proposal for establishing the Northern British Fisheries. 1783.

An Account of the present state of the Hebrides, and Western Coast of Scotland, being the substance of a Report to the Lords of the Treasury. 1785.

Observations on Slavery, particularly with a view to its effects on the British Colonies in the West Indies. 1789.

Observations on the effects of the Coal Duty. 1792.

Thoughts on the privileges and powers of Juries, with observations on the state of the country with regard to Credit. 1793.

Remarks on the Poor Laws of Scotland. 1793.

A practical Treatise on Peat Moss. 1794.

A general view of the agriculture and rural economy of the county of Aberdeen, and the means of its improvement. 1794.

A practical treatise on draining bogs and swampy grounds, with cursory remarks on the originality of Elkington's mode of draining lands. 1797.

Recreations in Agriculture, &c. 1790,—1802.

A calm investigation of the circumstances that have led to the present scarcity of grain in Great Britain, suggesting the means of alleviating that evil, and of preventing the occurrence of such a calamity in future. 1801.

ANGEVILLE, COUNT ADOLPHE D'—Born at Lampries (Ain), 20th May, 1796; formerly in the Navy, and deputy for the Ain.

Aperçu sur nos Colonies et notre Marine Militaire pour appuyer une pétition faite à la Chambre le 24me Janvier, 1832. Lyon, 1832.

Essai sur la Statistique de la population Française, considérée sous quelques uns de ses rapports physiques et moraux. Paris, 1836.

ANISSON DU PERON, ETIENNE ALEX-ANDRE JACQUES—Born 1748, and appointed, in 1783, Director of the Royal Printing Office. In 1790 he published a letter on the printing of assignats, and the different species of paper tried in their fabrication. On the 4th July, 1792, he was indicted for printing an unconstitutional decree. After the 10th August he was obliged to resign his office, and he was sent before the revolutionary tribunal and condemned to death 25th April, 1794.

ANISSON DU PERON,—Son of the preceding, was born at Paris, 26th October, 1776—was appointed auditor of the Council of State in 1806, and director of the Imperial Printing Office in 1809—Deputy from Puy de Dome in 1830—President of the Council-General of that department in 1840, and a Peer of France in 1844. He was one of the founders and vice-president of the Society for the Promotion of Free Trade.

De l'affranchissement du commerce et de l'industrie. Paris, 1829.

De l'enquête sur les fers, ou application des principes généraux à la question de la taxe sur les fers étrangers. Paris, 1829.

Examen de l'enquête commerciale sur les sucres en 1829, précédé de l'examen de l'enquête sur les fers. Paris, 1829.

Traité de Melhuen et de 1786 dans leurs rapports avec la liberté commerciale. In the *Journal des Economistes*. Vol. XXVII.

ANNALI UNIVERSALI DI STATISTICA—Edited by Francesco Lampato and a variety of Economists. The first series, forming 80 vols., ended in June, 1844. The second series, beginning July, 1844, ceased at the end of 1850. Milan.

ANNUAIRE de l'ECONOMIE POLITIQUE et de la Statistique. Edited by Messrs. Joseph Garnier and Guillaumin.—Paris. This series began in 1844. Each volume is divided into four parts. The first gives the substance of official reports relating to the population, the public finances, trade, the administration of justice, savings' banks, banks, charitable institutions, &c., of France. The second part is allotted to the City of Paris. The third gives similar information respecting foreign countries. The fourth gives general discussions on the most interesting questions of the day in Political Economy; a review of the proceedings of the Academy of Moral and Political Sciences; the principal Economical events of the year; a financial review and a biblio-

graphy of the preceding year. This publication contains, in a small compass, a great amount of valuable information.

ANNUAIRE DU BUREAU DES LONGITUDES.—This periodical contains many papers upon Economical subjects.

ANNUITIES.—An Annuity is a series of payments made at stated intervals, usually a year, whence the name, but very often more frequently, as half-yearly, quarterly, &c.

1. Next to a true conception of the nature of *Value*, which is the fundamental idea in Political Economy, the doctrine of Annuities is probably the most important. The subject of Annuities, viewed in its proper extent, comprehends incomparably the largest amount of existing property, and the most important material interests of mankind in a state of civilization. They are the fruits of civilization itself, and some of its most remarkable discoveries—Money and Interest.

2. The importance of the subject of Annuities may be seen when we state that, in addition to the subjects with which its name is more popularly associated, it in reality comprehends the whole theory of the value of landed property, the public funds, and all other subjects which produce an annual revenue, and the whole of Commercial Credit. In fact, we may say, that in its most comprehensive sense the doctrine of Annuities is the theory of the value of Fixed Capital. (CAPITAL.)

3. The doctrine of Annuities is the produce of that wonderful instrument Money (MONEY), and is a curious commentary upon the arguments of Aristotle and Dante to show that interest is unnatural and abominable. (ARISTOTLE. DANTE.) The theory of Annuities entirely depends upon the principle that money *naturally* produces interest, but more particularly upon the principle that interest produces interest, an idea that drove Plutarch almost beside himself. (PLUTARCH.)

4. An annuity, as we have said above, is a series of future payments, from whatever source arising, and the doctrine of annuities rests entirely upon this principle, that each of these future payments has a present value, and that all, or any, or any number of them, may be bought and sold, like an article of commerce. And the theory of annuities has for its object to discover the present value of each of these separate terms, and in a large branch of the subject to discover how many of them should be bought according to the circumstances of the particular problem.

5. The present value of an annuity is, therefore, the sum of the series of the present values of all the future terms. Now, let us take the case of a perpetual annuity, or a payment to be made at regular intervals for ever. If money bore *no* interest, it is clear that each future payment would be exactly equal to the present payment, consequently the present value of such an annuity would be the same as the aggregate sums to be paid for ever. That is, to purchase such an annuity, it would be necessary to pay down an infinite sum. A consequence which is manifestly absurd. Hence it appears that such a mode of calculating the value is manifestly erroneous.

6. Again let us suppose that simple interest is charged. Then each future payment would be

diminished by a small definite sum of uniform amount. And it is evident that to buy an annuity for ever, on such terms, would involve exactly the same absurdity as in the preceding case. That is, to secure a finite annual payment, we should have to pay down an infinite sum of money, which shews that this mode of calculation is also manifestly erroneous.

7. But if we suppose that *compound* interest is charged, we shall find that each term of the series will progressively and rapidly diminish. A larger quantity will have to be subtracted from each term in succession. We shall thus obtain a series of quantities in geometrical progression, the common difference being a fraction, and by the laws of Algebra, we know that such a series, even though it be infinite, has a finite limit. And that finite limit is the present value of the perpetual annuity.

8. Hence we see that the value of annuities *must* always be calculated at compound interest, in order to obtain a rational result. The present value of each term or future payment, is such a sum of money as improved at the given rate at compound interest, would amount to that sum in the given time. And the present value of the whole annuity is the sum of the series of the present values of each term.

9. An annuity, however, does not consist of any definite number of terms. It may be of any number, from a single future payment up to an infinite number, or any intermediate number. And under each species an enormous amount of property is to be classed. We shall shortly consider the different varieties of annuities, and the species of property they relate to.

10. I.—*The lowest form of an Annuity, i.e. a single future payment.*

This comprehends the whole theory of mercantile credit (CREDIT), which consists simply of a single future payment, and these future payments, under the form of bills of exchange, form an immense article of commerce. To buy a bill of exchange is usually called to *discount* it, and there is a most important class of traders whose chief business consists in buying bills of exchange or commercial debts. (BANK. BILL BROKER.) The main business of banking consists in buying or discounting bills of exchange. Now there is no difference whatever in principle between discounting a bill of exchange and buying a landed estate. To discount a bill is to buy a single future payment, to buy a landed estate is to discount a series of future payments.

11. II.—*The largest form of an Annuity, i.e. a series of future payments for ever.*

This comprehends the whole theory of the value of estates in fee simple, and that portion of the public funds which consists of perpetual annuities. To purchase a landed estate in fee simple is merely to discount a series of future payments for ever, as already explained. The same may be said of the purchase of all property which yields an annual revenue, such as canals, railways, the public funds, &c.

12. III.—*The intermediate form, i.e. a limited series, but exceeding one, of future payments.*

This variety is much the most complicated, and includes a great number of sub-varieties, the calculation of which involves a considerable portion of the theory of probabilities (PROBABILITIES). It

includes the theory of the value of leases, fines on the renewal of leases, estates in remainder or reversion, vested and contingent, and life and survivorship annuities of all sorts. To enter into a full detail of the methods requisite to find the value of all these various annuities would require an immense amount of mathematical detail, which is wholly beyond the purpose of this work, and for which we must refer to the standard treatises enumerated at the end of this article. All we can do here is to specify very briefly the different classes that may be formed, and the species of property which is included in them. We may have then—

1. *A series to commence immediately and terminate at a given time.*

(a) *And of this the termination may be certain.*

Under this form are included all leases for a certain number of years, and all annuities for a fixed number of years.

(b) *Or the termination may be uncertain.*

Under this form are all life annuities commencing immediately.

(b 1) *And this termination may depend upon a single uncertain event, or (b 2) upon several uncertain events.*

Thus, an annuity may be granted to continue during the life of a single individual, or during the life of the survivor of several individuals.

2. *A series to begin at a future period, and to continue for ever.*

(a) *And of this the commencement may be certain and definite.*

Thus, an estate may be sold to B, subject to a lease to A.

(b) *Or the commencement may be certain but indefinite.*

Thus, an estate may be settled on A for life with remainder to B in fee.

(c) *Or the commencement may be uncertain and indefinite.*

Thus, an estate may be settled on A and his heirs, whom failing, remainder to B and his heirs.

Or an estate may be settled on A for life, and if C be living at his decease, then to B and his heirs.

Or an estate may be granted to A until he be bankrupt, or insolvent, or innumerable other contingencies, and then to B and his heirs. To this form belongs the whole theory of estates in reversion, or remainder, vested or contingent, executory interests, springing or shifting uses, and executory devises, a subject of immense importance.

3. *A series to begin at a future time and to continue a limited number of years.*

(a) *Of this form the commencement and termination may both be certain and definite.*

Of this the fine paid for the renewal of an unexpired lease is an example.

(a 1.) *Or the commencement may be certain and definite and the end certain but indefinite.*

Thus, an estate may be granted to A and his heirs for 10 years, and then to B for life.

Or A may purchase an annuity for life to commence at the end of a given term.

(a 2.) *Or the commencement may be certain and definite and the end may be uncertain and indefinite.*

Thus, an estate may be granted to A for 10 years, then to B until some contingent event happens, as for instance until he marries, and then to C.

Or a husband may bequeath his widow an estate so long as she remains unmarried.

(a 3.) *Or the commencement may be certain but indefinite, and the end certain and definite.*

Thus, an annuity for seventy years may be granted to B and his heirs, to commence on the death of A.

(a 4.) *Or the commencement may be uncertain and indefinite, and the termination certain and definite.*

Thus, an estate or an annuity for a term of years may be settled on B contingent on A marrying or having a son, &c.

(a 5.) *Or the commencement may be uncertain and indefinite, and the termination certain but indefinite.*

Thus, a grant may be made to thirty different living people in succession, separately, for their lives;

Or a survivorship annuity may be effected by a husband in favor of his wife.

(a 6.) *Or the commencement and termination may both be uncertain and indefinite.*

Thus, an estate may be granted to A until some contingency, such as marriage, bankruptcy, birth of a son; then to B until some contingency occurs; then to C, and so on.

These are but very simple examples of the variety of forms which different estates or interests in property may assume. But to one or other of them the calculation of the value of all estates may be reduced. The entirety of course can only be equal to the sum of each separate interest, however numerous or complicated they may be. And when we further consider that the commencement and termination of each separate interest may be made to depend not only on a single contingency, but on any number of contingencies, it manifestly involves the whole theory of Probabilities, one of the most subtle of scientific subjects. Thus, the calculation of the value of a single interest in some given property may call forth the highest powers of mathematical skill and analysis, so much so, indeed, that mathematicians of the highest eminence have frequently been at fault in their endeavours on the subject. But to one or other of these forms, the infinite variety of ways which human caprice may dictate or suggest the disposition of property, may be reduced; and the subject is very far from being exhausted yet. The tables of mortality from which the probability or expectations of life are framed, are extremely imperfect. Nor can we expect that any results will be obtained at all commensurate with the scientific exactness which is demanded at the present day, until the experience of numerous offices has been tabulated and recorded for a very much longer series of years than has yet been done. If any one doubts the extreme imperfection of the science of calculation of the value of Annuities, let him propose, as we have done, a simple question in survivorship annuities, to a number of the principal offices, and he will be astonished at the difference of the answers he will receive, as much perhaps as fifty per cent. Nor are the enormous bonuses which most of the older offices add to their policies, any thing more than evidence of inaccurate calculation of the true premium necessary to be paid to secure a given amount.

De Witt upon Annuities, 1671.

An Estimate of the Degrees of Mortality of Mankind, drawn from curious tables of the births and funerals at the City of Breslaw, with an attempt to ascertain the price of Annuities on lives. By Mr. E. Halley. Philosophical Transactions, vol. 17, p. 596. 1693.

On Annuities for Lives. By Abraham Demoivre. 1724.

ANQUETIL DUPERRON. **ABRAHAM HYACINTHE**—One of the most distinguished scholars of the 18th century, was born at Paris 7th December, 1731, and educated there; he was intended for the church, but having no taste for an ecclesiastical life he devoted himself to the study of oriental languages, in which he acquired an extraordinary proficiency. So ardent was he in pursuit of this, that being unable to obtain a passage in a ship going to the East Indies, he enlisted as a private soldier in an expedition that was fitting out at L'Orient for that country. The minister hearing of his extraordinary love for his pursuit ordered him a free passage. After undergoing extraordinary difficulties, he made his way to Surat, where he found the remnants of the Parsees, whose language and religion were the principal objects of his search. He came home in an English ship, and reached Paris 4th May, 1762, with 180 MSS. almost entirely Zend, and he presented 18 to the Royal library, containing all the extant works of Zoroaster. In 1763 he was elected a member of the Academy of Belles Lettres. In 1771 he published, in 3 vols. quarto, his translation of the Zendavesta, for the manuscript of which he had refused £30,000 in England. He died 17th January, 1805. This distinguished man published many other works, amongst which those relating to economical subjects are—

De la dignité du commerce et de l'état du commerçant. Paris, 1789.

L'Inde en rapport avec l'Europe. Hamburgh, 1798.

ANSELL, CHARLES, F.R.S.
A Treatise on Friendly Societies. London, 1835.

ANTHOINE, ANTOINE IGNACE—Baron de St. Joseph, was born at Embrun, 21st September, 1749. He very early manifested a strong

bent for commercial affairs. He entered a mercantile house at Marseilles, and he was soon sent to superintend a branch of the establishment at Constantinople, which he conducted with great success. His *Memoirs on Commerce* were highly esteemed at the French court, and he was sent to examine Russia and Poland, with a view to extend French commerce in those countries. He was very favourably received by Catherine II. and Stanislaus, King of Poland. Catherine authorised him to found the commercial port of Cherson. In 1786 Louis XVI. ennobled him in very flattering terms. He then finally settled at Marseilles, and became one of the principal persons in the place, and did much good during the famine in 1790. Notwithstanding this he was exiled in 1793, and went to reside at Genoa, but returned as soon as the revolutionary violence was over. He was elected a member of the Council General of Commerce, of the Corps Legislatif, and then of the Conservative Senate, and was Mayor of Marseilles in 1805, where he effected great improvements and embellishments of all sorts. He died there 22nd July, 1826. In the hundred days he was a member of the chamber of representatives. He published,

Essai historique sur le commerce et la navigation de la Mer Noire. Paris, 1805.

ANZANO, THOMAS.

Reflexiones economico politicas sobre las causas de las alteraciones de precios que ha padecido Aragon y discursos sobre los medios que pueden facilitar la restauracion de Aragon. Zaragoza, 1768.

Blanqui commends this work.

APPLETON, NATHAN—

Remarks on Currency and Banking, having reference to the present derangement of the circulating medium in the United States. Boston, 1841. An excellent pamphlet.

ARBITRATION of the Exchanges. See EXCHANGE.

ARBUTHNOT, G.—Was private secretary to Sir Robert Peel, and to Sir Charles Wood.

Sir Robert Peel's Act of 1844, regulating the issue of Bank Notes vindicated. London, 1857.

This pamphlet is written in a fluent style, but unfortunately the author has never made himself acquainted with the ordinary mechanism of banking. At page 12 he treats the £38,000,000 of deposits in the various London Joint Stock Banks at that period, as *bond fide* cash deposited by the public. This is the touchstone of any man's real knowledge of banking. The delusion is almost universal, but it is as profound a delusion as the balance of trade. (BANK.)

ARBUTHNOT, JOHN, M.D., F.R.S.—Born in 1675, at Arbuthnot, near Montrose. He was educated at Aberdeen. He was one of the most celebrated wits and physicians in the reign of Queen Anne. His father, an episcopal clergyman, lost his preferment at the Revolution, and young Arbuthnot came to England, and settled at Doncaster for some time. Meeting with no employment there, he came to London, where his manners, learning, and wit soon acquired him the

friendship of the most celebrated literary men of the time, Pope, Swift, Gay, Parnell, Harley, Bolingbroke, and others. A fortunate accident brought him to the notice of Queen Anne, who appointed him physician to the court. He was equally distinguished for his scientific attainments as for his incomparable wit, and what does not always accompany such a quality, his goodness of heart. He was the author of several political satires. He died in February, 1735. His treatise on an economical subject is his—

Table of ancient coins, weights, and measures, explained and exemplified in several dissertations. London, 1727. Second edition, with an appendix by Dr. Benjamin Langwith, 1754.

A very valuable work, containing a great deal of information on the prices of all sorts of things in ancient times.

ARC, PHILIP AUGUSTE de Ste. FOIX, D'—Natural son of a Count of Toulouse, died in 1779, at Tulle, leaving, among numerous other works,—

Histoire du Commerce et de la Navigation des Anciens et des Modernes. Two vols. only printed. Paris, 1758.

La Noblesse Militaire opposée à la Noblesse Commercante.

Le Palais du Silence, conte philosophique, avec une dissertation historique et critique sur l'établissement des colonies de la Grèce, dans l'Asie Mineure. Translated from the Greek of Cadmus of Miletus. Amsterdam, (Paris,) 1744.

ARCERE, LOUIS ETIENNE.—Born at Marseilles, in 1698. A priest of the Oratory. In 1743 he became perpetual secretary of the Royal Society of Agriculture of Rochelle, and Superior of his order. Having, in conjunction with a friend who died in the course of the work, published a History of Rochelle, he obtained a pension, and was appointed a correspondent of the Academy of Inscriptions and Belles Lettres. He died 7th February, 1782. He also published—

L'Etat de l'Agriculture des Romains depuis le commencement de la République jusqu'au siècle de J. César. Paris, 1777.

Mémoire sur la nécessité de diminuer le nombre des Fêtes. 1763.

ARCO, GIAMBATTISTA GHERARDO, D'—Born at Arco, in the Tyrol, in 1739. He studied at Mantua, Parma, where he became acquainted with Condillac, and at Verona. Returning to Mantua he became a member of the Academy of Sciences, founded by Maria Theresa. The Academy having proposed as a prize subject in 1771, "The equilibrium which ought to be established between the industry of the town and the country with regard to their respective interests and wants," Arco wrote a dissertation "On the Politico-Economical harmony between a City and its territory," which gained the prize, and much public reputation. He published many other works on Political Economy, in which he unreservedly adopted free trade opinions. Joseph II appointed him governor of the Duchy of Mantua, where he greatly distinguished himself by his good administration. He founded a school of Agriculture for orphans, and expended great sums in charity to the distressed workmen, in the

severe winter of 1782. He died in 1791, having resigned his office some years previously. His dissertations on Political Economy are—

Dell' Armonia Politico-Economica trà la città e il suo territorio.—Del diritto ai transiti.—Dell' influenza del commercio sopra i talenti e su i costumi.—Dell' influenza dello spirito di commercio sull' economia interna dei popoli, e sulla prosperità degli Stati.—Dell' Annona.—Dell' influenza del Ghetto nello Stato.

ARGELATI, FILIPPO.—One of the most eminent literary men of his time, was born at Bologna, in 1685, a member of one of the most ancient families of the city. After studying there, he went to Florence, and became acquainted with the most remarkable persons there, especially the celebrated Magliabecchi. He devoted much time and labor to promote the publication of the works of literary and scientific men, amongst others, Ulysses Aldovrandi, the naturalist. The principal one, however, which he was the means of presenting to the world, was Muratori's *Rerum Italicarum Scriptores*. Hearing that Muratori found it impossible to bring his great work out, because there was no press in Italy which could execute it, Argelati found that Milan was the only place where it could be effected. Having gone there, he formed an association of Milanese gentlemen, who each subscribed a considerable sum, and by this means a suitable printing-office was established, where many other magnificent works were published besides Muratori. Argelati died 5th January, 1755. His own writings on Economics are—

De monetis Italia variorum dissertationes collectæ, recensitæ, et auctæ. Milan, 1750.

Nummorum series tam auri quam argenti et æris qui in officinâ monetariâ Mediolanensi cusi fuere, ab anno 1348 ad 1750.

ARISTOPHANES.—Born about 456 B.C., died about 380 B.C. We may quote a remarkable passage from the *Frogs*, which contains the earliest notice, that we are aware of, of an economical phenomenon of fundamental importance,—*That good and bad coin cannot circulate together, but the bad coin will drive out the good.* During the extreme distress caused by the Peloponnesian war, Athens had, for the first time, issued a debased gold coinage, the consequence was that the good money immediately disappeared from circulation. Aristophanes, *Frogs*, 665, says, "The State has very often appeared to us to be placed in the same position towards the good and noble citizens, as it is with regard to the old currency and the new gold. For we make no use at all, either at home or abroad, of those which are not adulterated, but the most beautiful of all money, as it would seem, which are alone well coined and ring properly, but of this base copper, struck only yesterday, and recently, of a most villainous stamp. And such of the citizens as we know to be well born and prudent, and honorable gentlemen, and educated in the palaestra, and chorus, and liberal knowledge, we insult. But the impudent and foreigners, and the base born, and the rascals, and the sons of rascals, and those most recently come, we employ."

This phenomenon, which has been observed in countless instances in all ages and countries, was

long the puzzle of statesmen and financiers. Sir Thomas Gresham was the earliest person, that we are aware of, who discovered the connection between the fact of the circulation of bad money and the disappearance of the good. We have therefore called it Gresham's Law of the Currency. (GRESHAM.) It is one of the fundamental laws of Political Economy.

ARISTOTLE.—Whom, if we are to judge by the unexampled influence he has maintained over the opinions of mankind, we must pronounce the most distinguished person that ever lived, was the founder of the Science of Political Economy. He was born B.C. 384, in Chalcidice, at Stagirus, on the Strymonic Gulf, on the margin of the Ægean Sea, illustrious as the cradle of all European literature. His father Nicomachus, one of the *Æscapiada*, hereditary professors of medicine, was the physician and friend of Amyntas, king of Macedon. He was also distinguished as a voluminous writer on Medicine, Physiology, and Natural History, and these studies exercised much influence over the mind of his son. Nicomachus died while his son was a minor, and left him under the guardianship of Proxenus of Atarneus, who discharged his office with greater fidelity than such persons generally do, and Aristotle always regarded him with the warmest affection to the end of his life. At seventeen he came to Athens, the centre of the civilized world, when Plato was at the height of his reputation. That great teacher had just left on his journey to Sicily, where he staid three years, and Aristotle devoted himself to study, during that period, to qualify himself to attend his lectures with due profit on his return. Aristotle remained at Athens for a period of twenty years, and amassed during that time those unexampled stores of knowledge which have rendered his name immortal. He was by far the most distinguished pupil of Plato, who called him "the soul of his school." During the last ten years he himself gave lectures on Rhetoric and Politics, and gathered round him a circle of scholars.

At the period of Plato's death, Philip of Macedon had commenced that career of encroachment which aroused all that was patriotic at Athens to resist him. He captured many of the Greek cities in Chalcidice, amongst others Stagirus, which was destroyed, and the inhabitants sold as slaves. Aristotle, as a person who enjoyed his confidence and friendship, was sent on an embassy to him which had not much success. Himself a foreigner, and the friend of the Macedonian King, Aristotle probably found himself an object of suspicion and jealousy to the Athenians, and found it convenient to retire for a while from that city. He went to reside at the Court of Hermias, tyrant of Atarneus in Mysia, who had been one of his scholars at Athens. The predecessor of Hermias had taken the opportunity of throwing off the yoke of Persia, when that power was engaged with an insurrection in Egypt. As soon as the Great King had suppressed that revolt, he sent to chastise the rebellious cities in Asia Minor. Hermias was defeated, and Atarneus captured. Aristotle succeeded in escaping to Mitylene, along with Pythias, the sister of Hermias, whom he married. After being there two years he received an invitation from Philip of Macedon, to superintend the education of his son Alexander, who was then thir-

teen years of age. This invitation he accepted B.C. 342, and he staid in Macedonia seven years, four of which were occupied in the education of his pupil. He had a pleasing opportunity of showing his love for his birthplace, for Plutarch says that he demanded, as the price of his instructions, the rebuilding of Stagirus. This request was complied with. The citizens who were in exile were recalled, and those in captivity were redeemed. Philip prepared a grove for the studies and literary conversations of the philosopher, and in Plutarch's time, the stone seats and shady walks frequented by him were still shewn, and the grateful citizens instituted a festival in his memory.

When Alexander set out on his eastern expedition, Aristotle did not accompany him, but sent with him his nephew Callisthenes, an honest, but rough and imprudent man, who did not know how to accommodate himself to the position he was placed in. Aristotle himself returned to Athens, after an absence of twelve years. The successors of Plato held the Academy, so Aristotle opened his school at the Lycæum, near the temple and grove of Apollo Lyceus. He was of feeble health, so he delivered his lectures walking up and down the shady paths (*περίπατος*), whence his followers were called *Peripatetics*. Here he remained thirteen years, and during that time the greater part of his works were composed. During this time, we may believe that he attained the summit of human felicity, if ever any man did. The Macedonian party was uppermost at Athens, and the philosopher, with stainless name, attended by crowds of admiring disciples, enjoyed everything that wealth or fame could give. Alexander is said to have given him 800 talents, or £200,000, and put several thousands of men at his command in all quarters of his empire, to procure materials for his Natural History, which was written at his request. For these thirteen years Aristotle reigned without a rival. But during the latter part of it, the friendship between him and his pupil sustained some diminution, in consequence of the imprudence of Callisthenes, who could never tame down his rough honesty to the level of the servile adorners of the conqueror, and at last provoked his own destruction.

When the astounding news of the death of Alexander was spread through Greece, the popular party made a last vain effort for Pan-Hellenic independence. Inspired by the burning eloquence of Demosthenes, Greece fought its last fight for liberty, and, under the command of Leosthenes, a transient gleam of success crowned their arms. The anti-Macedonian party prevailed for a short time, and evil days fell upon the Philosopher. The leaders of the fallen party were, as usual, proscribed. The immaculate character of Aristotle gave no hold for the calumnies of politicians, but some flagitious wretches instituted a prosecution against him for blasphemy, for having, as they said, paid more than mortal honors to the memory of Hermias and Pythias. The Philosopher, then in the decline of life, and broken in health, saying to his friends, "Let us leave Athens, and not give the Athenians a second opportunity to commit sacrilege against philosophy," abandoned the scene of his glory, and removed with his property to Chalcis, in Eubœa, where some of his relatives lived, and his political friends were in power. Safe from the malignity of his enemies, all they could do was to

wreak their vengeance on him, by the harmless insult of repealing a former vote of the people in his honour, and condemning him to death in his absence. But a more powerful enemy than the Athenians had him in his grasp. A long-standing disease of the intestines carried him off in his sixty-second year, in August, B.C. 322, and two months later, the last scene of free Greece being played out, his immortal opponent Demosthenes, was added another illustrious victim to the Martyrology of faction. Thus, in the space of little more than twelve months, three of the most transcendent intellects the world ever saw, were extinguished.

This eminent philosopher, who combined within himself, digested, and systematized all the learning and science of his time, was the true founder of Social Philosophy. His entire works are said by Diogenes Laertius to have exceeded 450,000 lines, but the only ones, of course, we can notice, are those which relate to our present subject. And it is greatly to be lamented, that they have come down to us in an incomplete and fragmentary form, if indeed they are anything more than abstracts of his lectures. The *Politics* is incomplete, and critics unanimously pronounce the second book of *Economics*, which is printed with his works, to be spurious, and many attribute the first book to Theophrastus. And it is even said that the original text of the three last chapters of the first book, and all the second, is lost, and were translated into Greek by Aretinus, from a Latin version. Diogenes Laertius only mentions one book of *Economics*, but others mention two. No one has mentioned any one else to whom they ought to be assigned. And we may perhaps fairly consider them to be either by some scholar of Aristotle who took notes of his master's lectures, or they may be a sketch, or common place book of Aristotle's own, containing examples which he collected for his use when he should complete his treatise at some future period. The draught of the *Politics* was not finished at his death, and the second book of the *Economics*, after the first chapter, is merely an unconnected collection of instances in which a variety of persons, and states of all sorts, tyrannical, constitutional, and republican, provided themselves with money on certain occasions. Very similar cases are brought forward in the *Politics*, I. c. xi. So that it appears quite possible that they might have been materials which Aristotle collected, to be used in his regular treatise, as might seem advisable. Be that as it may, however, the work is interesting as it is the first that contains the name of POLITICAL ECONOMY, and in his Treatises on Social Philosophy are contained the foundations of all modern systems of Political Economy, both those which take the widest, and those which take the narrowest view of the objects and limits of the science.

We shall endeavour to trace briefly a general outline of his ideas on the subject of *Politics*, *Economics*, and Political Economy, though it is not always easy to follow him, because he is not always uniform and consistent with himself in the use of these terms, and they are often so mixed up together, as not to be easy to render a clear definition which shall always be accurate. The following will, we hope, be found sufficiently correct.

Aristotle considers social philosophy or political

science, in its most general sense, to be the "chief and most excellent of all." (*Pol. I.*, 1.) and to be "the chief, and especially the master science," (*Nicomach. Ethics*, I., 2.) and in its most comprehensive sense to include three divisions: *Ethics*, which treat of the regulation of the individual man; *Economics*, which treat of the regulation and management of families; and *Politics*, which treat of the regulation of the society of families, or the state. The word *politics*, then, he uses sometimes in the extensive sense of including the other two, and sometimes in the narrower one of excluding them.

Again, the word *Economy*, in its original and most comprehensive sense, includes everything which relates to the regulation and good of the family or household. And this clearly includes two separate branches, 1st, the ruling or governing the household, and 2nd, providing for its maintenance. But the acquisition of subsistence is manifestly the first requisite towards ruling it. "Some, therefore," he says, "identify the acquisition of subsistence with economy, while others consider it as the chief part of it, I mean the acquisition of wealth." (*Pol. I.*, 3.)

He then says that the household consists of freemen and slaves, and having discussed the different methods of ruling a household he treats of slaves, and as slaves are a portion of property, he then inquires into the nature of property in general. (*Pol. I.*, 8.) And again, he says, "some may question whether the acquisition of wealth is the same thing as economics, or whether it is part of it, or something subservient to it, and if so, in what manner." "It is evident, however," he says "that economics is not the same as the art of getting wealth; for it is the business of the latter to acquire it, and of the former to use it. For what art is there to use what is in the house, besides economics? But yet it is doubtful whether the getting of wealth is part of economics, or another kind of thing." In Chapter 10 he still further goes on, and says, "it is clear whether getting wealth is part of economics or politics, for as politics does not make men, but takes them from nature, and uses them as she finds them, so ought nature, whether it be the earth, or the sea, or anything else, to supply them with provisions, and it is the business of the master of the house (economist) to manage them properly; for it is not the weaver's business to make the wool, but to use it, and to distinguish what is good and useful from is what is bad and useless."

From this principal idea of economics being chiefly concerned in obtaining wealth, a new arrangement of the subject unfolds itself, which he has adopted in his systematic treatises. Instead of the original order of ethics, economics, politics, or the regulation of man regarding himself, his household, and the State, we have it thus,—*Ethics*, as before, the relation of man towards himself; *Politics*, the relation of man towards others in a social capacity, both private and public, the family, and the State; and *Economics*, the relation of man in both capacities towards property.

This, then, appears to be the broad general outline upon which these three treatises are constructed. Yet, in treating of them at length, parts of each of them will be found incidentally necessary to the consideration of each of the

others, so that each of them will be found to be so intertwined and interlaced with the others, that they must all be studied together. Thus, in the *Ethics*, in the discussion of what happiness consists in, the question naturally arises whether wealth conduces to happiness. This leads to the consideration of the nature of money and its uses. So, in the discussion of *Liberality* (iv. 1, 2), the nature of property or wealth is discussed. And in treating of *Justice* (v. 5), he is led to the consideration of the equality of services rendered between man and man, and this involves the whole theory of *VALUE*. He says that civil society is held together by mutual exchanges, and this leads him to show that there must be some common measure of value, which is *MONEY*. In the further development of the question he discusses many things which more appropriately belong to politics.

Again, in the *Politics*, where he considers man in his social relations, he starts the question what his duties and offices are in his character of the head of a household, and this, as we have seen, leads him to discuss the true meaning of the words *Economy* and *Economics*, then to consider the art of getting wealth (*χρηματιστική*), and then whether a community of property is good or bad for a State. And in this treatise he considers man in relation to his wife and slaves, chiefly as persons, though the latter partly as property.

Lastly, in the *Economics*, which is expressly on the relation of men, both in their private capacity of individuals, and their public capacity as the State, towards property, he considers man in relation to his wife, as having rule over her, and to his slaves as absolute property. The province of *Economics*, he says, is both to found a family and to enjoy it, and the parts of a household are a man and his possessions. In Chap. 6 he says that there are four qualities which the master of a household (*οικονόμος*) ought to possess regarding wealth. Thus, the word *Economy* gradually slides almost exclusively into the meaning of wealth, and in the second book, if it be by him, he says that there are four kinds of economy or modes in which different bodies acquire wealth. The regal, the satrapical, the *POLITICAL*, and the domestic. The first two relate to the manner in which a monarchical or despotical government obtains its revenue, the third how a free state (*πόλις*) raises a revenue, and the last, how a private man makes an income. Hence, we see that the expression *POLITICAL ECONOMY* in this treatise, in which it is first used, denotes the *method in which a free State raises a revenue*. And the sense attributed to *Economy* in this book exactly agrees with that adopted by Adam Smith in the introduction to B. IV. of the *Wealth of Nations*. "Political Economy, as a branch of the science of a statesman or legislator, proposes two distinct objects, first to provide a plentiful revenue or subsistence for the people, or, more properly, to enable them to provide each a revenue or subsistence for themselves, and secondly to supply the State or Commonwealth with a revenue sufficient for the public services." Thus Adam Smith combined the four sorts of Economy, and gave them the general name of Political Economy.

We have seen (*PRELIMINARY DISCOURSE*) that

the earliest modern author who uses the term Political Economy, Montchretien, employs it much in the same sense. But the founders of the modern science of Political Economy used it in a very much wider sense, to denote the social relations of men to the State, to each other, and to property, or, in other words, they joined the politics and economics of Aristotle into one subject, and considered it as one great science, which they called *POLITICAL ECONOMY*.

The preceding section will, we trust, be found to give a sufficiently accurate notion of the ideas of Aristotle on the subject. The great difficulty consists in pursuing the changes of meaning that words gradually assume, and the subtle and sometimes overfine distinctions raised, which are subsequently overlooked and abandoned. The most ardent admirer of Aristotle must admit that he does not always maintain that rigorous accuracy and consistency in the use of terms, which is indispensably necessary in science. The different shades of meaning, too, attributed to the different words relating to wealth, are also a source of some perplexity, and require much attention. Thus, *χρήματα* sometimes means utilities, or wealth in general, and sometimes money in particular. It may be useful to endeavour to exhibit the different shades of meaning of the different words.

Οικονομία, οικονομική.—The art of managing a household, which is divided into two branches, first the art of ruling it, and secondly the art of providing subsistence for it; hence the art of using wealth already acquired, and lastly the art of acquiring wealth or subsistence.

Κτήμα.—Anything that may be possessed—possessions in general—wealth. *Κτήμα* is very rarely if ever applied to *money*, and it is sometimes used in opposition to *χρήμα*, as in Plato *De Legg.*, *κτήμα καὶ χρήμα*, property in *kind*, and in *money*.

Κτητική comprehends the art of using acquisitions, and also the art of acquiring wealth or utilities, and this art is divided into three branches, 1, the natural i.e. the increase of the products of the soil and animals; 2, from commerce; 3, an intermediate species, from forests and mines. And the second or commercial branch is subdivided into three varieties, from trading, from usury, and from the wages of labor.

Χρήμα.—Anything that may be used, or that possesses utility, hence wealth in general, or things whose value is measured by money; hence, often money in particular, as the object with which the idea of wealth is most popularly associated.

Χρηματιστική.—The art of acquiring wealth or utilities in general, and money getting.

Πλοῦτος.—Abundance, riches, wealth, connected with *πολύς*, *πλεόν*.

Νόμισμα.—Coined money, from *νόμος*—that which is appointed by law as the equivalent for commodities and services in general.

We shall now give such extracts from these treatises as are sufficient to show Aristotle's ideas upon the fundamental conceptions of the modern science of Political Economy.

Nicomachean Ethics.—Book iv. Chap. 1.

And we call wealth, all things whose value is measured by money.

Χρήματα δὲ λέγονται πάντα, ὅσων ἡ ἀξία νομίσματι μετρεῖται.

Book IV. Chap. 3.

Now the term *VALUE* is used in reference to *EXTERNAL* goods.

Ἡ δ' ἀξία λέγεται πρὸς τὰ ἐκτὸς ἀγαθά.

Book V. Chap. 5.

But in the community of exchanges, such an idea of justice as a proportionate, and not an equal retaliation, holds men together. For society holds together by means of a proportionate reciprocity of services. For either they seek to return evil for evil, (for it seems a species of slavery, if they cannot revenge themselves,) or to return good for good, for if not, there is no mutual exchange, and by this mutual exchange of service they hold together. Therefore, too, they build the temple of the Graces in the highways, that kindness may be required, for this is peculiar to gratitude. For it is right to return a service to the person who has done us one, and then to be the first to do the next one. And diagonal conjunction produces a proportionate return. Thus let a builder be A, a shoemaker B, a house C, and a shoe D. The builder then should receive from the shoemaker some of his work, and give him some of his own in return. Then if there be proportionate equality at first, and then an exchange takes place, there will be what we have said. If not, there is no equality, and such dealings cannot go on. For there is nothing to prevent the work of the one being better than that of the other. But these must be equalized. And this is true in the case of other arts also. For they would come to an end, unless the things which each reciprocally gives and receives, were equal in quality and quantity. For there is no commercial dealing between two physicians, but between a physician and a farmer, and generally between persons of different and dissimilar occupations. But nevertheless these must be equalized. Wherefore there must be some way of measuring all things, which can be exchanged, and from this necessity came the use of money. And, it is, in a sense, a medium, for it measures all things, both their excess and their defect; how many shoes for instance are equal to a house or food. As the builder then is to the shoemaker, so must the shoes be to the house, or to food. For if it be not so, there can be no exchange, or common dealing. And this cannot take place unless the things are in some way equal. It is therefore necessary, as was said before, that all things should be measured by some one thing.

And this thing, in truth, is the necessity or the *DEMAND*, which holds together all commercial dealing. For if men wanted nothing, or not to the same degree, there would be no exchange, or not to the same amount. And money has become, conventionally as it were, a substitute for the demand; and for this reason it is called *νόμισμα*, or legal tender, because it is not so by nature, but by law, *νόμος*, and it is in our power to change it for something else, and render it useless. When these things then are equalized, there will be an equal exchange of services. So that as the farmer is to the shoemaker, so is the work of the shoemaker to the work of the farmer. And when

they make an exchange, it is necessary to bring them to the form of a proportion, for if not, one extreme will have both differences, i.e., one party will receive more and give less than he ought, and the other will receive less, and give more than he ought. But when they have their own, they are equal, and can have dealings, because this equality can take place between them. Let the farmer be A, the food C, the shoemaker B, and his production made equal to the farmer's production, D. For if they could not thus make an equal mutuality of services, there could be no dealings between them. Now, it is clear that necessity or demand is, as it were, the one thing which holds commercial dealings together, because when they have no want of each other, either both or one of them, they do not exchange, as they do when one has what the other wants. As for instance, when those who want wine give corn in exchange. These things, therefore, must be made equal.

But with regard to a future exchange, (if we want nothing at present, that it may take place when we do want something) money is, as it were, our security. For it is necessary that he who brings it, should be able to get what he wants. But even money itself is liable to the same thing as other commodities, because it is not always of equal value, but yet it is more likely to vary less. Therefore there must be some way of estimating the value of all things, for so there can always be an exchange, and if this, then commercial dealings. And money made, as it were, a common measure, equalizes them. For there can be no commerce if there be no exchange, nor any exchange if there be no equality, nor any equality if there be no common measure. And, in truth, it is not possible that things which differ so much should be commensurable. But so far as regards the *want* of them, this may be possible. And there must be some one thing fixed upon by common consent. Therefore it is called *νόμισμα*, legal tender, for it makes all things commensurable. For all things are measured by this legal standard. Let a house be A, ten minæ B, a bed C, and let A be half B, if the value of a house be equal to five minæ. And let the bed C be worth the tenth part of B. It is clear, therefore, how many beds are equal to a house, namely five. And it is clear that this was the mode of exchange, before the invention of money, for it makes no difference whether five beds be given for a house, or the value of five beds.

Politics.—Book I. Chap. 3.

A complete household consists of freemen and slaves. * * * Now there is part, which some consider as absolutely identical with economy (the management of a household), and others as the most important part of it. And we must inquire how the matter stands, I mean what is called the art of getting wealth.

Book I. Chap. 4.

Since, then, property is part of the household, so also must the art of getting wealth be a part of economy, (or the management of the household,) because, without necessities, it is not possible to live, or to live well. And since in the arts which have a particular purpose, it is necessary to supply them with suitable instruments, if the work is to be accomplished, so it is in Economics. But

some instruments are inanimate, and others are animate. Thus, to the pilot the helm is inanimate but the look-out man animate, so too in the arts a workman is a species of instrument. So also property is an instrument in regard to living, and wealth is a multitude of instruments, and a slave is a living property, and every workman is an instrument above all other instruments. For if every instrument being bid or anticipating an order, could accomplish its work, as they talk of the Statues of Dædalus or the tripods of Vulcan, which the Poet says came of their own accord to the assembly of the gods, so, if the shuttles wove of themselves, and the plectrum would play on the lyre, the artificers would want no workmen, and the master no slaves. Now, what we call instruments are things for the purpose of making something else, but property is itself to be used. For, from the loom, something comes besides its use, but from clothing and a bed only its use.

Book I. Chap. 8.

And since a slave is a part of property, we shall make a thorough inquiry into the nature of property in general, and the art of gaining wealth, in the manner we have already laid down for our guidance. First, then, some might be in doubt whether the art of getting wealth is the same thing as economics, or a part of it, or subservient to it. And if subservient, whether it is so, as the art of making shuttles is to the art of weaving, or as the art of making bronze is to the art of making statues. For they are not subservient in the same way, but one supplies the instruments, and the other the materials. And I mean by materials, the stuff out of which the work is formed, as wool to the weaver, and bronze to the caster of statues. So that it is clear, that the art of getting wealth is not identical with economics. For it is the duty of the former to provide, and the latter to use. For what art is there in using what there is in the house, except economics? And still it may be doubtful whether it is a part of it, or a different species. For if it is the business of him who is seeking wealth, to discern whence wealth and property are to be got, and property and wealth include many different kinds, it must first be settled whether agriculture be a part of the art of getting wealth or something different, and whether the care and acquisition of subsistence in general, is so or not. * * *

So also it is clear that we may say, that plants were made for the sake of animals, and other animals made for the sake of man; the tame for our use and subsistence, and the wild, if not all, at least the greater part, for the sake of food and other uses, in order that we may have clothing and other instruments from them. Since, then, Nature makes nothing without an object, and nothing in vain, it necessarily follows that she has made all these things for the sake of man. Wherefore even war seems to be in some measure a natural mode of acquiring wealth. For hunting is a part of it which we are obliged to employ against wild beasts, and against such men as being born to be slaves, are unwilling to submit to it. And such a war is natural and just. That form only, then, of acquiring wealth, which is according to nature, is a part of Economics, which ought either to supply it, or those ought to cause it to be supplied, whose duty it is to keep in store

an abundance of things, which are necessary and useful to the subsistence of the community, both as a state and as a family. And true wealth seems to consist in these. And an independent property sufficient for a happy life is not boundless, as Solon, the poet, says—

“And of wealth men set no bounds to themselves.”

For there is a bound to this, as to other arts; for in no art whatever are the instruments boundless, either in number or magnitude. But wealth is a multitude of instruments, both economical and political. So that there clearly is a natural mode of acquiring wealth, both in domestic and public economy, and the reason is plain.

Book I. Chap. 9.

There is, too, another mode of acquiring property, which men especially call, and it is just to call it so—the art of gaining wealth, by which there seems to be no bounds to riches and property. This many persons consider to be the same as what has just been spoken of, on account of its near affinity to it. But though it is not exactly the same as the art which has been spoken of, it is yet not very different from it. For the former comes by nature, and the latter not by nature but rather by some experience and art. And let us commence our enquiry into it from this point. Every possession has two uses, both indeed appropriate, but not equally so. For one is peculiar to the thing, but the other is not peculiar to it. Thus a shoe may be worn, or it may be exchanged. For the shoe may be used both ways. For he who exchanges it with any one who wants a shoe for money, or food, uses it no doubt as a shoe, but not according to its peculiar use. For it was not made for the purpose of being exchanged. And the same things hold good regarding all other property. Exchanges of all things go on, which first sprung from natural circumstances, as some men have more, and others less than what they require. Hence, it is evident that retail-dealing is not a natural mode of acquiring wealth. For men were obliged to use exchanges in order to obtain what was necessary for them. It is clear, then, that in the first community, that is the family, there is no need of it, but only when the community extends. For the former of these had all things in common, but the latter who being many separate communities have each of them also many other things in common, which they were obliged to exchange with each other according to their mutual necessities, by way of barter as many foreign nations do now. For they exchange useful things for useful things, but nothing more, such as giving and receiving wine for corn, and other things in a similar way. This mode of barter then is not contrary to nature, nor is it any form of gaining wealth. For it took place for the sake of obtaining what was necessary to one's natural independence. From this mode of dealing, however, (*i. e.*, barter) arose the other (*i. e.*, money), as might be expected. For the supply of what was wanted was only to be had from a foreign country, so that the use of money was necessarily invented for the purpose of importing what was wanted, and exporting a surplus. For every thing is not easy of carriage which is naturally useful. Therefore, with a view to exchanges, men agreed upon something

to give and take amongst each other, which being itself an article of value, might easily pass from hand to hand, for the purposes of daily life, such as iron or silver, or anything else of this nature, which was ascertained at first simply by its weight and size, but afterwards by putting a stamp on it, to do away with the necessity of weighing it. And this stamp was put upon it to shew the quantity of the metal. The use of money having thus sprung from the necessity of exchanges, another form of getting wealth sprung up, namely—retail dealing, which at first was very simple, then by experience it was conducted with greater art, as to when and how commerce could produce the greatest profit. Hence the art of gaining wealth seemed chiefly to relate to money, and its aim to be, to be able to discover how to get the greatest amount of wealth. For it is the mode of obtaining abundance of wealth. For men often consider wealth to consist in the abundance of money, because it is in reference to money that wealth-getting and trading are concerned. To some, again, money seems to be a mere trifle, valuable only by law, and not by nature, so that if those who use it were to change their sentiments, it would be of no value, nor useful to obtain anything we wanted, and he who had plenty of money would often want necessary food. And it would be absurd to say, that wealth is of such a nature, that a man with plenty of it might die of hunger, as the fables they tell about Midas, who, through the insatiableness of his desire, had everything he touched turned into gold. Wherefore men seek around for some other species of wealth and property, and rightly too, for the business of money getting is different from natural wealth, which is the true Economics. But trading also procures wealth, not in every way, but only by the exchange of useful things. And the latter seems to be about money, for money is the first element and whole object of trading. And the wealth that may be got by this mode of acquisition seems boundless. For as the physician's art has no limits with respect to health, and each of the other arts has no limits in regard to its aim, (for each of these they wish to accomplish to the greatest degree possible, but the means of each of them to attain their aim are limited, and their several aims are the limits of each.) So also of this art of getting wealth there is no limit to its aim, for its aim is to accumulate as much wealth and riches as possible, but there is a limit to Economics, (or the art of using wealth,) though there is none to acquiring it, for this is not the business of Economics. Wherefore it seems that some limit should be placed upon riches, though we see the contrary of this actually happen; for all who seek wealth, increase their money without limit. And the reason of this is their near connection. For the uses of the same instrument, money, being common to both forms of acquiring wealth, are confounded with each other. For each is a use of the property, but not in the same way, for in one way there is an end of the thing itself, but in the other a mere increase of money. So that this seems to some to be the object of Economics, and they think that they ought to make it their aim to save or to accumulate a store of money without end. And the cause of this disposition is, that they take much care to live, but not to live well; and this passion being boundless, they desire to

have boundless means to gratify it. And even those, too, who intend to live well, seek after sensual enjoyments, so that as this too seems to depend upon riches, all their labour is to get money, and by this means sprung up the second form of getting wealth; for as they are excessive in their enjoyment, so they search for means to gratify this excessive enjoyment, and if they cannot provide it by means of getting wealth, they will try to do it some other way, and use all their powers in some manner not intended by nature. Thus, for instance, manly strength was not given to make money by, but to inspire courage. Nor is this (*i. e.*, making money) the object of the soldier's or the physician's art, but victory and health. But such persons turn all arts to the acquisition of wealth, as if that was their aim, and as if everything ought to contribute to that end. Concerning, then, the unnecessary acquisition of wealth, and what it is, and how we came to need it, enough has been said, and concerning the acquisition of what is necessary, which is different from it, and which is the natural form of Economics, which relates to subsistence, it is not boundless like the other, but has a limit.

Book I. Chap. 10.

That then is clear, which was doubtful at first, whether the acquisition of wealth is part of the duty of the head of a family or state, but it must necessarily exist. For as political science does not make men, but takes them from nature, and uses them as they are, so ought nature to afford subsistence, whether the land, or the sea, or anything else; and it is the duty of the head of the family to manage what he procures from these sources, as he may require it. For it is no part of the business of the weaver to make the wool, but to use it, and to know what is good and useful, from what is bad and useless. For some might doubt why the art of gaining wealth is part of economy, and the art of medicine is not, since good health is as requisite to the family as subsistence or any other necessary. And as it is in some sense the duty of the head of the family, and the State, to look after the health of those under them, and in some sense not, but of the physician; so also as to wealth, it is in some sense the duty of the head of the house, and in some sense not, but of the slaves. But it is especially the duty of nature to provide this, as has already been said. For it is the duty of nature to supply food for its offspring, for food is provided for everything from the source from which it comes. Wherefore, the natural mode of gaining wealth to all, is by the increase of the products of the earth, and of animals. But since, as we have said, they may be applied in two ways, one for the purpose of trading, and the other for domestic consumption, of these the latter is necessary and commendable, but their use in trading is justly censured, (for it does not spring from nature, but from ourselves,) the trade of usury is most deservedly detested, because the gain comes from the money itself, for which purpose it was not intended. For it was made for the purpose of exchange, but usury multiplies it. From which circumstance it takes its name, *τόκος*, *progeny*, for the very thing which is begotten is like its parent, and usury is money begotten of money, so that of all modes of making profit, this is the most contrary to nature.

The Economics.

Aristotle having treated of man in relation to himself (*Ethics*), in relation to other men, both in his private and public capacity (*Politics*), comes next to treat of him in his relation to property (*Economics*). But yet the name is mixed up with political considerations, for he says that the political form of government is composed of many rulers, and an equality of heads of houses, but an economical rule is monarchical like that of the head of a house.

Chapter I., 1.

"Some of the arts indeed are divided into two parts, and it is not the same which makes and uses what is made, as for instance, a lyre and pipes. It is, however, the business of politics both to constitute a state from the very beginning, and to manage it well when it is established. And a state indeed is a collection of families, and territory, and property sufficient to support a comfortable existence. And it clearly is so, because when they are unable to attain this end the society is dissolved; moreover, this is the object for which they came together. But that for the sake of which anything exists and is produced is its essence. So that Economics are clearly anterior to Politics, for their object is so, and a household is part of the state. We must, therefore, examine what economical science is, and what is its object.

Chapter II.

"The component parts of a household are a man and property; and since the nature of anything is best seen in its simplest parts, the same holds good with regard to the household. So that as Hesiod (*Op. et Di.*, 405), says, there ought to be,

"First a house, then a wife, then oxen for the plough."

For the first of these is necessary for food, and the others belong to freemen. So that one ought to lay down good rules for the society of a wife, that is to say, about what kind of a one should be provided. But the first care should be given to acquire property according to nature. But by nature agriculture stands first, and in the second place, such profits as come from the earth, such as mining and other things of this sort. But agriculture above all, because it is just; because it does not derive its gain from men with their consent, as retail dealing and the wages of labor, or against their will, as by war. Moreover, it is in accordance with nature; for all things naturally derive their subsistence from their mother, as men do from the earth. And besides this it greatly contributes to manly courage; for it does not make the body unserviceable as the mechanical arts do, but able to live and to work in the open air, and especially able to brave the enemy, for these are the only persons whose possessions lie outside the city walls."

He then discusses the conjugal relations, as the wife was, in Grecian ideas, in some sense the property of the husband. Thus, in the *Politics* he discusses the relations of a man to his wife, and slaves, chiefly as persons, in the *Economics*, as property.

The second book of the *Economics* is by many entirely rejected as spurious, some, however, allow the first chapter to be genuine. However the

case may be, the first chapter is the only one which is of the character of a treatise. All the rest is a mere collection of expedients used by different persons to obtain money on various occasions. If it be by Aristotle at all then, it is merely a collection of raw materials, which he intended to use as advisable in a regular treatise. In *Politics* I, c. 11, we find some instances cited of the same description as are gathered together here; and in V., 2, he quotes the case of Cypselus, which also occurs in *Economics* II., 2. So that the case seems enveloped in much doubt. We shall only notice the first chapter, in which the expression *POLITICAL ECONOMY* appears for the first time.

Economics.—Book II. Chap. 1.

"And there are four different kinds of Economy (for we shall find that all others may be reduced to these), the regal, satrapical, the *POLITICAL*, the private. But of these the Regal is the greatest and most simple; the *Political* is the most varied and the easiest, and the Private is the least and most varied. And they must necessarily have many points in common, but we must first look to those points which are the distinctive features of each. First, then, let us consider the Regal Economy. And this is of universal power, and it comprehends four forms, about the coin, about exports, about imports, and about expenditure. And of these the most important is that which relates to the current coin, I mean when and how much it should be raised or lowered in value; and with regard to exports and imports, when and what receiving from the satraps in office, it will be profitable to sell; and with regard to the expenditure, what can be taken off, and when, and whether contributions to the expenses should be given in money or in kind. Secondly, is the Satrapical Economy, and of this there are six species of public income, from land, from native productions, from merchandize, from taxes, from cattle, and from other sources. And of these, the first and the best is that which comes from the land (and this is what some call rent, or land-tax, and some tithes); and the next comes from native productions, such as gold, silver, and copper, and where each of them is to be got. And the third is that from trading, and the fourth is that which comes from agricultural produce, and market tolls; and the fifth is that from cattle, which is called profits, or tithes; and the sixth is that which comes from other sources, which is called the poll-tax, and handicraft-tax. And the third is the *POLITICAL ECONOMY*, and of this the best income is that from the natural products of the country, then that from trading, and transit duties, then that from daily business. And the fourth and last, is the Private Economy; and this is not subject to any particular rule, because a household is not managed with reference to any single aim; and it is the least, because the incomings and outgoings are on a very small scale. And of this also, the best kind of income is that which comes from the land, next that from other kinds of personal property, and thirdly from usury. And, besides these points, there is one which is common to all the kinds of Economy, and it must be looked upon as no subordinate part of them, especially in the last kind, that the expenditure should not exceed the income."

We have given these long extracts from Aristotle, because that great philosopher is undoubtedly to be considered as the father of political economy, and the reader has thus brought before him enough to enable him to form his own judgment of what his ideas on the subject were. They are also interesting, as presenting the first ideas of what were the objects and limits of political economy, in which it is impossible not to see that there is a certain unsteadiness of view and a want of fixity of conception characteristic of the imperfection of the science. But yet it is not too much to say, that in these extracts, together with the one from *Æschines Socraticus*, which we have already given, are contained the chief fundamental conceptions from which the science may be deduced by strict reasoning. Thus, we see that he lays it down as a definition that *Wealth is everything whose value may be measured in money*, which is the fundamental and comprehensive conception on the subject. And it manifestly follows that the converse is true, *that everything whose value is measured in money is wealth*. The very first thing, then, to be done, is to discover all things which fulfil that test. As soon as we do this we find that that this definition embraces all that the most advanced Economists have declared to belong to it. For it manifestly includes not only *material* wealth, at which Adam Smith and Ricardo stopped short, but also all *mental* acquirements or qualities which may be turned to profit, which *Æschines* in ancient times saw, and which view J. B. Say, and the modern French School of Economy, Mr. Senior, and Mr. J. S. Mill, have adopted. But even this enumeration is not extensive enough, because it also manifestly includes all instruments of credit of all sorts, all deferred payments and annuities, as we have shewn elsewhere, (*Theory and Practice of Banking; and Elements of Political Economy*), in short anything that may be bought and sold. Thus, we see that the whole science of Political Economy is included in a proper and legitimate interpretation of Aristotle's definition.

Having thus conceived a definition which embraces the full extent of the subject, Aristotle also saw clearly and enforced the doctrine that value is not an *internal quality*, but an *external relation*. That value means exchangeability, and that whatever has that quality has value, as *Æschines* too saw. That in fact, *VALUE IS NOT A QUALITY BUT A RATIO*. And this is the true rock upon which Political Economy is to be built. It is that great first principle which is to be steadily kept in view through all controversies, and the neglect or misunderstanding of which, is the chief cause of the confusion which has arisen.

Again, he saw that the originating cause of value was the necessity, or want of the purchaser, in modern language, the demand, and that the measure of value was the degree of the necessity, or want, or the intensity of the demand, and that this is measured by money. But in this point his doctrine is defective, because though it is perfectly true that demand is the *origin* of value, yet it is necessary to show that competition to supply the demand regulates the *amount* of value. These are the two opposing elements, which in all cases whatever, regulate value, as we have shewn elsewhere. (*Theory and Practice of Banking*, chap. 2. *Elements of Political Economy*, chap. 2.—*PRICES, THEORY OF.*) Thus, in this instance, Aristotle's

conception is not so complete as in the first case, because it does not include the whole of the truth, but only one side of it.

And in fact, a false conception of the cause of value is the rock which has proved fatal to almost all modern Political Economy. For it is almost entirely founded on the doctrine that *labor is the cause of value*, a principle which is carried to its extreme point in Mr. McCulloch's theory of absenteeism, which we have already noticed. This doctrine is the *ignis fatuus* which has been the ruin of most of modern Political Economy. Labor is never, in any case whatever, the cause of value, although in the majority of cases, it is inseparably associated with it, and it often influences the amount of value. Archbishop Whately has thoroughly exposed this fallacy (WHATELY), and has laid the foundation of a new system of Political Economy. In a single paragraph he has effected the entire overthrow of the system of Political Economy of Adam Smith, Ricardo, and McCulloch. This paragraph contains the germ of an entirely new mode of treating the subject, which it is the object of our *Elements of Political Economy* to develop.

Although Aristotle gave money the name of the medium of exchange, yet he saw clearly that its use was to enable transactions to take place without an exchange of *commodities*. That, in fact, it was the representative of services for which some commodity or equivalent in exchange is still due. "But with a view to *future* exchange, if we have at present no need of it, money is as it were, our security, that when we are in need we shall be able to make it." Now, this is exactly the conception which, with a slight change of language, we have shewn to be the true basis of Monetary Science. (*Theory and Practice of Banking. Elements of Political Economy.*—*MONEY*). Money is something that is wanted, and wanted only, when there is *no* exchange of commodities, or an *unequal* exchange of them, and its true use is to represent the inequality of the exchange, or the quantity of services due to the possessor of it. It is, in short, the representative of *DEBT*, or a universal Bill of Exchange, which the owner of it can demand payment of at any time he pleases. This is the fundamental conception of Monetary Science, and pursued to its legitimate consequences contains the whole theory of Money. (*CURRENCY.*)

Aristotle saw too, that so far as regards Economic Science, human labor is to be classed with instruments; an instrument, it is true, above all other instruments, but yet an instrument. In modern language it is a species of capital, and its value is subject to the very same laws that all other commodities are subject to.

We see then, that in these extracts are contained the great leading outlines and fundamental conceptions of Political Economy, which require only to be filled up, and developed to their legitimate consequences, in exactly the same manner that is done in all other natural sciences. Bacon says that there are deserts and wastes in time, no less than in lands. But there are, too, desert places in the human mind, and science was one of those sterile regions in the mind of Antiquity, so fertile, so rich, and so prolific, in all works of the imagination. And these seeds of truth, sown by Aristotle, fell in this desert and barren region

and remained unproductive for more than 2000 years before they began to germinate, and bear their legitimate fruit, under modern culture.

On the other hand, we cannot fail to remark that his views were tinged with a good deal of that fanciful species of dogmatizing, or laying down arbitrary principles without sufficient proof, and those overfine and supersubtle distinctions, which were so marked a feature of, and exercised so deleterious an influence over, much of ancient physical philosophy, and which is the true reason of its having made so little advance. Thus, he lays down that the bounty of nature is the only true source of wealth, and he has a decided and prejudiced aversion to trading. He says that there are two uses of everything, its actual use, and exchange. The one he considers natural, and the other against nature. This difference in the mode of use corresponds very much to the distinction between revenue and capital. A shoemaker would probably think that the exchange of a shoe is quite as natural an operation as using it. Aristotle looks with a very doubtful and jealous eye upon all exchanges whatever. But, money being for the very purpose of exchange, has thus a dubious origin, and when that purpose, which is already doubtful, is changed into lending it at usury, its mischief is doubly aggravated, and he pronounces the last mode of using it to be utterly detestable and unnatural.

And this arbitrary dogma and unfounded prejudice enthralled the human mind for centuries. Calvin was the first great man who had penetration enough to expose this sophism, which imposed even on the mighty intellect of Dante. So entirely is this dogma now overthrown that the modern doctrine is, that money *naturally* produces interest, and many important branches of the theory of value entirely depend upon it. (ANNUITIES.)

Some of the most admirable examples of reasoning have been employed in the overthrow of the doctrine of the inherently wicked nature of usury. Conspicuous among these is Bentham's *Defence of Usury*, a very masterpiece of argument, which indeed has done its work so effectually that it is now in great danger of being forgotten. We may perhaps be inclined to smile at the fallacy which so long deceived the senses of mankind, but we shall find, in the course of this work, that many of the most firmly accredited doctrines of Political Economy at the present day, are as entirely baseless and unfounded as the doctrine of usury which we see now to be so fanciful.

And it is, in truth, this very spirit of arbitrary dogmatizing, and reception of fanciful doctrines on the authority of great names, without a due investigation whether they are truly founded in nature, which is the bane and the plague-spot of Political Economy at the present day, and which has made it the last of the sciences to be brought within the pale of Inductive Philosophy.

ARNOULD, AMBROIS MARIE.—Born at Dijon, in 1750, where he studied, and then came to Paris, where he devoted himself to finance and Political Economy. In 1791 he published his *Balance of Trade*, which procured for him the place of chief of the Board of Trade, which he lost in 1794, when all commerce was destroyed. After the 9th Thermidor he opposed the National Con-

vention, and was one of the chiefs of the Parisian insurrection of October, 1795. Obligated to fly on account of his share in these events, he devoted himself to writing works relating to Political Economy, which gained him considerable reputation. In 1798 he was elected a member of the Council of Ancients by the department of the Seine, and all his time was employed in drawing up reports on commerce and finances. In 1799 he was appointed one of the Council of five hundred, and he took a warm part in the revolution of the 18th Brumaire. On the 27th December, 1799, he presented a long report upon the means of restoring public credit. This and his ardent Bonapartist zeal gained him a place in the tribunate, and after its suppression he was appointed Master of the Accounts and Counsellor of State, and died in 1812. He was a disciple of the theory of the Balance of Trade.

ASGILL, JOHN.—During the latter half of the 17th century this country teemed with projects for the erection of banks of all kinds. One projector more fortunate than the others, William Paterson, succeeded after several efforts in establishing the Bank of England. The success of this establishment at its outset, imparted additional activity to other projectors, and the financial necessities of the Government to support the war with France, made them lend a willing ear to any one who promised them relief. A number of schemers, among whom Briscoe, Chamberlen, and Asgill were the most conspicuous, succeeded in getting an Act passed to establish a Land Bank. The project, however, completely failed. This Asgill was a lawyer of Lincoln's Inn, who had attained considerable eminence in his profession, and was a man of considerable wit, and ability. The stoppage of the Bank of England in 1696, and the great scarcity of money, owing to the bad state of the silver coinage, which had been called in to be recoined, set the busy brains of Asgill and others to devise a new species of money besides gold and silver. The ideas of these persons were, that a paper currency based upon land would answer equally well as gold and silver, and might be issued to the amount of the value of the land in specie without depreciation. To enforce this view Asgill published his pamphlet mentioned below. This was the principle afterwards adopted and developed at much greater length by John Law, and which was afterwards carried out with such tremendous consequences by means of *Assignats*, in the French Revolution (*Assignats*). As this doctrine has found hosts of admirers from that day to this, and, as it touches the very first principles of Monetary Science and Political Economy, we shall reserve a full discussion of it, until we come to the most eminent person with whose name it is associated. We shall accordingly consider the opinions of Asgill and other pre-Lawites together with the work of John Law himself. (LAW.)

In 1699, Asgill went to Ireland, and obtained a very lucrative business under the act for the resumption of forfeited estates. He married the daughter of the attainted Viscount Kenmare, and purchased of the Crown his estates, to be held in trust for his son. He was returned to the Irish Parliament for the borough of Enniscorthy, but the house expelled him four days after he took his seat, for having written a pamphlet said to contain blasphemous doctrines. In 1705 he was elected

member of the English House of Commons for the borough of Bramber, being the executor of his friend, Doctor If-Jesus-had-not-died-for-thee-thou-hadst-been-damned Barebone, who had considerable property in the town. In 1707 he was arrested for debt during an interval of privilege. The house ordered him to be released, but his pamphlet was brought before the house, which voted it blasphemous, and, notwithstanding a spirited defence, he was expelled 18th December, 1707. He was then again immediately arrested, and remained a prisoner in the Fleet and King's Bench prisons for 30 years, till his death in 1738. During this period he wrote and published an immense number of pamphlets, chiefly political and theological, which had considerable success. Some accounts state that he was 80, and some that he was 100, at the time of his death. The pamphlet in which he brought forward his currency doctrine is entitled—

Several Assertions proved in order to create another species of money than gold and silver. Lincoln's Inn, Sept. 1696.

ASHBURTON, LORD.—See **BARING, ALEXANDER.**

ASSETS.—From the French *assez*, enough. It is alleged by some authorities that in early times, before feudal doctrines became so firmly imbedded in our law, that the heir of a deceased person was bound to pay, out of the inheritance, such of the debts of his ancestor as his goods and chattels were not sufficient to satisfy. Other authorities, however, deny this. At a later period it is certain that heirs were not bound, unless specially named in the contract. In such cases as the heir was bound by deed, or writing under seal, to the payment of a debt, or the fulfilment of a contract, he became liable to do so to the extent of the lands which came into his hands. And the lands so descended were called *assets* by descent, because the possession of the land was *enough* or *sufficient* to make him liable for the debts of his ancestor to that extent. So the property which comes into the hands of any executor is called *assets*, because it is *enough* to render him liable for the debts of the testator to that amount. So the property of a bankrupt which comes into the hands of his assignees is called *assets* because it is enough to make them liable to discharge the bankrupt's debts to that amount. So the word *assets* has come to signify the property in general of any trading company; and besides that, it denotes anything that is a *sufficient* account, or answer to a liability. Thus, when the Directors of a Company receive the capital or subscription of the shareholders, that becomes a *liability* from them to the shareholders. But as the establishment of every concern requires a considerable expenditure, the "Preliminary Expenses" are an *asset* as between the directors and shareholders, because it is a sufficient account to the shareholders from the directors for their liability. So the profits of the year are a *liability*, and the payment of the dividend is an *asset*, because it is a sufficient account of the liability. So also in banking, the credits entered to the accounts of the customers on the deposit of money, or the discount of bills of exchange, are *liabilities*. The money actually deposited, or the bills of exchange discounted by the

customers, are the *assets*, because they are sufficient to meet the liabilities.

ASSIGNATS.—The paper currency, not convertible into specie, but for the security and redemption of which certain public lands were *assigned*, which was created during the French Revolution from 1789 to 1796.

1. The history of the assignats deserves to be studied with the greatest attention, as they afford the most perfect example the world has seen of a certain theory of currency which was originated by some schemers in this country, in 1695.—(ASGILL, BRISCOE, CHAMBERLEN.) This theory was further developed by John Law, (LAW) and forms the peculiarity of his system, and notwithstanding the results of practical experience, it has still numerous warm supporters in this country and abroad. Nor can anything be more instructive than to read the views and expectations of its advocates in the debates in the French National Assembly, and its practical results which followed so immediately after its adoption.

2. The doctrine simply stated is this:—"That if a paper currency, not convertible into specie, be based or secured upon any article of value, such as land, and be issued to an extent not greater than the value in specie of such article, such paper currency will not be depreciated in comparison to specie."

3. Such is the theory of John Law, which found great favor in France during the financial embarrassments of the Revolution. His treatise on Money and Trade, in which this theory is developed, was translated into French in 1790, for the purpose of enlightening the public mind, and the issues of the assignats were expressly founded upon it. We shall now see how it was verified in practice.

4. Whatever moral causes contributed to bring about that unparalleled convulsion, named the French Revolution, the immediate cause was the apparently irremediable disorder of the finances, and the habitual excess of the expenditure over the receipts. And yet, when we come to examine the actual amount of debt which brought that great kingdom to destruction, we shall be surprised at its comparative insignificance. In the year 1750 the entire public debt of France was only £88,000,000. Thirty-seven afterwards, in consequence of the war in support of the Americans, and a long series of annual deficits, it had risen to £120,000,000. But even this was trifling compared to the resources of the country. Great Britain, with a soil not equal to two-thirds of France, and a population of about 12,000,000, was flourishing under a debt of £238,000,000. France, teeming with resources, had a population of 25,000,000. A succession of able ministers, since Turgot, in 1771, had been vainly endeavouring to curb the constantly increasing deficit, and to equalize the expenditure with the receipt. But the measures, necessary to effect this, aroused the deadly hostility of all parties. The attempts to reduce the expenditure made enemies of those who lived on the plunder of the public; and the attempts to raise new taxes set the privileged orders of nobility, and clergy, in a flame. Credit was for some time sustained by presenting to the public willfully falsified accounts, but when the actual truth was discovered, it destroyed all the

confidence of the capitalists, and no fresh loan could be raised.

When Calonne was made Minister of Finance, in 1783, he found only two bags, of 1,200 francs each (£48), in the treasury. The annual deficit was upwards of £4,000,000. His financial reputation enabled him, for a few years, to contract a series of loans, the dates of these were:—

	Francs	£
Dec. 1783	100,000,000	or 4,000,000
" 1784	120,000,000	" 4,800,000
" 1785	80,000,000	" 3,200,000
Sept. 1786	30,000,000	" 1,200,000
Feb. 1787	50,000,000	" 2,000,000
	<hr/> 380,000,000	<hr/> 15,200,000

5. At length, at the end of 1786, it was felt that this system could go on no longer, and Calonne proposed that the ancient practice should be resorted to, of calling together the *Notables*, to give their advice under the gravity of the situation. This advice was adopted, and that body met in 1787, when the real state of the finances was laid before them, which shewed that for upwards of thirty years there had been a constantly increasing deficit. In 1764 it was already £1,600,000, in 1786 it was £4,600,000, and for the current year it would not be less than £5,000,000, and, upon this appalling state of matters, he called upon the nobles and clergy to forego their privileges, and submit to equal taxation with the other classes.

6. His exposures and proposals created a universal storm of indignation from all classes. The philosophers and the liberals were furious to find that this state of things had existed under the administration of their favorites, when they wished to make it appear that all the difficulties were owing to the extravagance of the Court. The nobles and clergy unanimously resisted all breaches of their ancient immunity from taxation. Calonne was obliged to yield to the storm and retire. On the 11th April, 1787, Brienne, Archbishop of Toulouse, was appointed to succeed him. The new minister presented a financial statement to the *Notables*, exhibiting a deficit of £5,600,000. But the privileged orders resolutely refused to tax themselves, and declared, that neither they, nor the Parliament, nor any other authority but the *STATES-GENERAL*, had the power to do so. As any measures of relief were hopeless, the Assembly of *Notables* was closed on the 25th May, 1787.

7. All attempts to induce the *Notables* to submit to sacrifices for the public good having failed, the government went on in the old despotic system. The Parliament of Paris was more compliant than was expected, and registered some edicts which they had previously refused. On the 14th of July, Brienne tried to induce them to register an edict imposing a duty on stamps, but they immediately refused to do so, unless the state of the accounts was laid before them. "You ask for the *State* of accounts, it is the *States-General* that you want," cried a member. This expression embodying the universal feeling, produced an immense sensation. The Parliament decided that no perpetual tax could be imposed, except by the *States-General*.

8. Brienne sent back the edict for a stamp duty to the Parliament to be registered, along with one to impose the land tax equally upon all classes. The Parliament replied that they were incompetent to register such edicts, and that the States-General only could impose such taxes. The king sent to register the edicts by force, and banished the Parliament to Troyes. All these circumstances tended to increase the universal demand for the States-General. At length both the Parliament and the Crown, seeing the necessity of an accommodation, came to a compromise, by which it was agreed to withdraw the forcible registration of the edicts, and the Parliament did so voluntarily. In November, Brienne proposed to borrow £17,200,000, to be paid up by instalments in five years, and, as an inducement, pledged the Royal word that the States-General should be summoned before the end of that period. The Parliament, however, refused to assent to this enormous loan.

9. In May, 1788, the *compte rendu* shewed a deficiency for the year of £8,440,000, and as all resources seemed at an end, from the constant refusal of the Parliament to consent to any new taxes, and the total extinction of credit, a national bankruptcy seemed inevitable. Seeing that the Parliament was inflexible in its determination to refuse all new taxes, Brienne convoked an assembly of the clergy, hoping that they would consent to be taxed, or at least to vote a gift, for the relief of the State. But the clergy were as obstinate as the laity, and equally demanded the States-General. All hopes of assistance from the nobility, clergy, or Parliament being thus at an end, and the sum in the treasury being reduced to £16,000, on the 8th of August an edict was issued convoking the States-General for the 1st May, 1789, and on the 16th, the Exchequer adopted a partial suspension of cash payments. All dividends above £48 were to be paid, two fifths in paper, and the remainder in specie. Two days afterwards the notes of a private banking company, the Caisse d'Escompte, were declared legal tender, and the Bank forbidden to pay them in specie, which made them immediately fall to a heavy discount.

10. The proclamation of a national bankruptcy created such a universal storm that Brienne was obliged to resign, and Necker was recalled. His wealth and his reputation as a financier, brought a temporary restoration of credit, and loans were freely tendered to him, which procured a transient alleviation of difficulties. The frightful disorders of the country in 1789, completely prostrated the power of the Government. It became impossible to collect the taxes, the revenue had already fallen off by £8,000,000, and Necker, on the 6th August, 1789, laid the state of the finances before the Assembly, and demanded a loan of 30,000,000 francs, but so low was public credit that no capitalists could be found to advance it.

11. On the 24th September, Necker told the Assembly that credit was at an end, money had disappeared from circulation, and was everywhere hoarded, and offers of an increased rate of interest had entirely failed in effecting a loan. The Exchequer, the City of Paris, and all the public bodies, were bankrupt. The King and Queen and the Ministers had sent all their plate

to be melted down, but such sums were quite inadequate to meet the public expenses. The working classes were in a dreadful state, and, unless means were immediately found, neither the troops, nor the dividends, nor the public debts could be paid.

12. At length the Assembly could no longer stave off the necessity of some decisive measures. On the occasion of Necker's appeal to them, it had voted a tax of 25 per cent. upon every body's income, which had been much less productive than had been expected. On the 2nd October, Talleyrand brought forward a motion to confiscate the whole ecclesiastical property of the kingdom, and after reserving a pension to the clergy, to appropriate the remainder to the public necessities. This was vehemently opposed by Maury and Sièyes, but carried by a majority of 568 to 341. Forty did not vote, and 246 were absent. Thus these unpatriotic men who refused to give any portion of their property to aid the public necessities, saw themselves deprived of the whole of it. This property was estimated at £80,000,000, and the sale of it was expected to produce sufficient means to defray the pensions of the clergy, the interest of the public debt, and the civil establishments for some time.

13. No immediate purchasers could be found for this immense property. The Assembly had ordered the sale of church and crown property to the amount of £16,000,000, and on the 19th December, 1789, decreed that a paper currency should be created to that amount, bearing 5 per cent. interest, and called *assignats*, because these lands were decreed to be sold to redeem them. This plan, however, did not succeed; after the terrible excesses of the preceding summer few wished to buy the land, and they did not place much confidence in a revolutionary title. Under these circumstances, the municipality of Paris proposed that it, and the other principal cities in the kingdom, should purchase the property, in the first instance, for the purpose of reselling them by degrees in smaller portions. As they had no funds to pay for this property, they gave Bills payable at a certain date, called *bons* or municipal paper. The holders of these *bons* had the right of requiring that a sufficient quantity of property should be exposed to sale to reimburse them.

14. When these *bons* became due the municipalities had no means to pay them, and then, by a decree, of April, 1790, the assignats, ordered to be created by the decrees of the 19th and 21st December, 1789, were declared legal tender, with interest at the rate of 4½ per cent., the value of the Assignat being the capital, and the interest calculated day by day. The clergy, who saw in this measure the final break up and loss of their property, and the nobility, who were now thoroughly alarmed at the unexpected length to which the Revolution had already gone, vehemently opposed the creation of this paper money, and numerous addresses against it were presented from the chief cities of commerce.

15. The entire unsettlement of the government during this Revolutionary period, had only increased the public debt in a greatly augmented ratio. From 1750 to 1787 it had increased by thirty-two millions. In three years, from April 1787 to April 1790, it increased by £49,560,000. The relief obtained by the first issue of Assignats

was too small to last long, and the ease with which it was procured, naturally caused a speedy recurrence to the same resource. In September, 1790, it became impossible to meet the payments of the public debts, and debates on the subject anxiously occupied the Assembly day after day. After a long speech on the public debts, Mirabeau proposed to create new Assignats, to double the amount of the former issues. This proposal was strongly resisted by Bergasse, Lazerolles-Cazales, Maury and others, and supported by Barnave and others, and finally carried.

16. The question of the Assignats called forth the most vehement debates, and created great interest in the public. Several long dissertations for and against them appeared in the *Moniteur*, and the debates in the Assembly well deserve a perusal. Nothing can be more admirable than the speeches of Talleyrand, Antoin Morin, Décrétat, and Dupont de Nemours, pointing out the ruin and misery they were certain to bring upon the country. Already a depreciation had appeared with the first issue. For wine, which sold for 200 livres in money, cost 220 in assignats; and the piastre, which was 5*l.* 7*s.* in specie, was 5*l.* 18*s.* in paper. Dupont de Nemours warned them by a very striking example, of what the consequences would be. He said,—"You have a striking example before your eyes. There was, ten years ago, in the United States of America, a paper currency secured like the one you propose, on the honor and loyalty of the whole republic, and on an enormous amount of landed property, supported also by eloquent speeches, by Sovereign decrees, and by the safety of the State. Well, in spite of all that Congress, Washington, and Franklin could do, a pair of boots sold for £36,000 in paper, and a supper for four persons, for which ten dollars was the usual price, cost £50,000 in paper." Admirable and conclusive as these speeches were, they do not appear to have elicited a single mark of applause, while those of Mirabeau and Barnave, filled with the most palpable fallacies, and which were afterwards most signally falsified in every particular, were received with enthusiastic applause. Just the same as afterwards took place in the English House of Commons in 1811, with respect to the Bank Note, from the consequences of which folly we are still suffering. So much for the value of the judgment of a popular assembly upon a scientific question. It was carried, by a majority of 508 to 423, that fresh Assignats, to the amount of 800,000,000 of francs should be created, but it was firmly resolved that the issues should never exceed 1,200,000,000, and they were to bear no interest, and the interest on the first issue was stopped.

17. Specie had already begun to disappear with the first issue, it now continued to do so with accelerated rapidity, and the exchange with London began steadily to fall with each succeeding issue, until at last it ceased to be quoted. These were the very same phenomena which were manifested twenty years afterwards in England, and which gave rise to the celebrated Bullion Report, and exactly the same doctrine was then maintained, that it was the value of specie which had risen, and not that of the paper fallen, which was the resolution of the House of Commons in 1811.

18. During 1791 two fresh creations of 200,000,000 were decreed, 1st November, and 18th December, and it then appeared that two milliards 600,000 (£80,024,000) had been created, and 348,000,000 (£13,920,000) burnt, and the exchange with London, which had been 27½ in January, 1790, had fallen to 25 in October, to 24 in May, 1791, to 23 in July, and to 19 in December, and was subject to very violent fluctuations.

19. In 1792, on the 30th April, a new creation of 300,000,000 (£12,000,000) was decreed, and the maximum in circulation raised to 1,700,000,000, or £68,000,000. On the 31st July another creation of 300,000,000 was decreed, and the total allowed to be in circulation raised to two milliards (£80,000,000). On the 24th October the Committee of Finance reported that in all two milliards, 589,000,000, had been issued, of which 617,000,000 had been withdrawn from circulation and burnt, which made the number in circulation on the 5th October, 1,972,000,000, and at the same time the national property held to secure them was valued at 3,170,638,237 livres. A further issue of 400,000,000 was then decreed, and the maximum fixed at 2,400,000,000.

20. During the winter of 1792-3 the internal evils of the country greatly increased. The Assignats were at a discount of 30 per cent., and the shopkeepers everywhere refused them in payment of articles of prime necessity, and they kept back their commodities from the market rather than sell them for this depreciated paper. Where sales were effected the price rose enormously in proportion to the diminution in value of the Assignat. This increase of the nominal price was usually attributed to the greed of forestallers, or *accapareurs*, and the more violent began to demand a *maximum*, or fixed price. The Girondists, who were chiefly the commercial party, and even the Jacobins at first were opposed to the maximum. Riots broke out in Paris in February, 1793, the populace plundered the shops, and assailed the Jacobins with the most violent menaces in case they refused to petition the Convention to enact the *maximum*. The most influential popular leaders in vain endeavoured to appease their fury.

21. On the 3rd February, 1793, Cambon reported to the Convention that up to the 26th January, 3,067,450,040 Assignats had been created and issued, of which 682,000,000 had been returned in payment of taxes and national domains, leaving 2,387,460,040 in circulation. The domains already in the hands of the State amounted to 3,170,638,237 francs, which exceeded the Assignats created by about 70,000,000. He estimated the emigrants at 29,000, and their property, after subtracting their debts, at a net capital to the State of three milliards. He further estimated that property to the amount of about 1,600,000,000 had recently come into the hands of the State, and that the total property upon which Assignats might be created amounted to about four milliards 600,000,000. He recommended that a fresh creation of 800,000,000 should be decreed. This was done, and the sum total allowed to be in circulation fixed at three milliards 100,000,000. The same day war was declared with England. In the meantime the public distress went on increasing. On the 11th

April the Convention decreed six years' imprisonment to any who should sell Assignats for less than their nominal value in silver, or should make a difference in prices, according as they were paid in paper or specie. And on May 2nd, they decreed a *maximum* price of corn for a limited time.

22. On the 7th May fresh creations were decreed to the amount of 1,200,000,000, the public property being estimated at nearly seven milliards. Notwithstanding the severity of the law, a silver franc in June was worth three paper francs, and in August six. In July the forestalling of provisions, and even retaining them from daily sale, was declared a capital crime, and every one was ordered, under a similar penalty, to make a return of the quantity he had on hand, and the quantities he intended to bring to market.

23. The government made the most energetic efforts to bring the Assignats to par, and to inspire the holders of them with confidence. Cambon stated that an *agiotage* took place between the Royal and Republican Assignats, and demanded the suppression of those bearing the effigy of the king. On the 28th July, it was decreed that all the latter under one hundred lives, should cease to be legal tender, but should be received in public payments till the 1st of January following. In order to attach the interests of all the public creditors to the revolution, the whole of the public debts were consolidated. Some of them were as old as the time of Louis XIII., and they were of many different forms. The *Moniteur* of 1793, No. 273, contains, in a supplement of sixteen pages, a complete account of the public debts and the decree for consolidating them. Cambon said that the debt must be made uniform and republicanized. It was decreed upon his proposal, that a great book should be formed, called the "Great Book of the Public Debt," in which the names of all the public creditors should be inscribed. The capital of each was converted into a perpetual annuity, at 5 per cent. This was to be their sole title, and they were ordered to give up all their other titles to be destroyed. By this means it became impossible to distinguish the debts contracted during the Monarchy, from those contracted since the revolution. The whole of the consolidated debt was thus converted into a mass of perpetual annuities of £8,000,000 per annum.

24. At this period the Assignats in circulation were of the nominal value of £151,000,000 sterling. Those which bore the royal effigy and were demonetized, amounted to 22½ millions sterling. They were to be received in payment of taxes till the 1st of January, 1794, and after that to have no value at all. A forced loan of a milliard from the rich had been decreed in May, and this sum Cambon destined to redeem an equal quantity of Assignats. Those who came forward quickly were to be entered as creditors in the great book, for annuities at 5 per cent. By these and other means, it was calculated that the whole amount in circulation would be reduced to 83 millions sterling, by the January following. To raise this forced loan, every commune was invested with dictatorial powers to investigate the incomes of each of its members. The sum of 1,000 francs was allowed as necessary to each

member of a family, all above that was taxed, by an increasing scale of 10 per cent. for each 1000 francs, so that by this means all income above 10,000 francs was absolutely seized.

25. Many persons seeing the fluctuating value of Assignats, had invested their means in shares of Joint Stock Companies, whose profits were supposed to be independent of the depreciation of the circulating medium. To put an end to this rivalry, all Joint Stock Companies were abolished, and all whose funds consisted in shares payable to bearer, or transferable at pleasure. The penalties against buying and selling Assignats, and charging a different price when paid in specie or paper, were greatly increased, and death was decreed against all who kept back from public sale, articles of first necessity, which were declared to be bread, wine, butcher's meat, corn, flour, vegetables, fruit, charcoal, wood, butter, tallow, hemp, flax, salt, leather, drinkables, salted meat, cloth, wool, and all stuffs, except silk. Every trader was ordered to render a statement of his possessions, and domiciliary visits were appointed to verify them, and any fraud was punished with death. Commissioners appointed by each commune were ordered to inspect the invoices, and from them to fix the price, leaving a moderate profit to the dealer, and even if the invoice prices were so high as to leave no profit to the dealer, he must still sell them, at such prices as the purchaser could afford.

26. These measures soon caused an almost entire cessation of trade. Most of the shops in Paris and other towns were shut. The retail dealers had purchased at higher prices than the maximum, and were speedily ruined. Moreover, the maximum only applied to them. There was none for any of the preceding stages of the manufacture, or transport. They, therefore, either shut up their shops altogether, or only exposed for sale their goods of the worst quality at the maximum, and reserved the best for those who came to buy them in secret, at their real value. Where formerly there had been so much life and animation, there was now nothing but a sepulchral silence, and the shopkeepers barricaded their doors, ready to escape by the back at a moment's notice, on the appearance of the revolutionary commissioners.

27. The populace was seized with fury on seeing the natural result of these measures, and besieged the legislature for new and more rigorous laws to compel the dealers to continue their trade. The meat was diseased, and all other sorts of provisions were increased in quantity and weight, by the most abominable adulterations. Pressed by this external force, the Convention was compelled greatly to extend the laws of the maximum, so as to go back to the raw material. The prime cost of all articles was fixed on the basis of 1790, with a small profit allowed on each operation. Every dealer who had been in business a year, and had left off or diminished his trade, was declared suspected, and thrown into prison. Consumers were only allowed to buy from retailers, and these from wholesale dealers, and the quantity which each might purchase was fixed by law, and it was only obtainable by tickets, delivered by the Revolutionary Committee.

28. The loans levied with such terrible severity, brought in large contributions, and with the

other sanguinary laws, respecting trafficking in Assignats, nearly restored them to par for a short period at the close of 1793. Moreover, it was enacted that concealed gold, and silver, and jewels, should belong—one half to the state, and the other to the informer, consequently the very possession of specie made them suspected. These circumstances made it reappear in circulation for a short time. But all these efforts were vain. Production almost ceased, and at length in February, 1794, Paris was obliged to be put on an allowance of meat. The quantity fixed was seventy-five oxen, 150 quintals of mutton and veal, and 200 hogs a day. At first no one was allowed to have more than half a pound of meat every five days, and soon afterwards, the Convention decreed a general fast for six weeks, with regard to meat. Meantime the creations of Assignats continued with unabated rapidity. By May, 1794, there were nearly six milliards in circulation, after deducting those which had been returned and destroyed. In June, a fresh issue of 1,105,000,000 was decreed; and, although the property they were based upon, was estimated at 15 milliards, the Assignat had now fallen to the twelfth part of its nominal value.

29. At length, after the destruction of Robespierre and the reign of terror, the maximum could be maintained no longer, and was abolished. But the question of the depreciation of the Assignats still remained, and anxiously engaged the attention of government. Sales of public property, forced loans, and a demonetization of the paper were all attempted, with equal ill success. Lotteries with fabulous premiums, and no risks, tontines, and all sorts of plans were devised to diminish the quantity of the paper. Prices being released from an arbitrary law, sprung up to their natural level. But the enormous expenditure constantly required fresh issues, which far overbalanced any efforts made to reduce them. Johannot, the Minister of Finance, at last proposed the only possible remedy, to return to specie as the only measure of value, and to reduce the Assignats to their value in specie. But the Convention rejected the proposition from a Republican horror of specie, which was supposed to have ruined paper; and, because the English having so much, were supposed to be able to make the Assignats vary at pleasure. Jean Bon St. André then proposed to adopt corn as the standard, so that any person who owed rent or taxes to the amount of 1,000 francs, at a time when a quintal of corn sold for ten francs, was to pay the value of 100 quintals in Assignats. This proposal was rejected, as corn was then at four times its usual price, and several other plans were also rejected. At last it was decreed that any one might have the national domains at three times the price in Assignats, at which they were in 1790.

30. The extraordinary fluctuations in the value of the Assignats produced a vast amount of speculation, or *agiotage*. In the space of an hour the price sometimes varied from 150 to 210 livres for the *louis d'or*. The repeal of the law of the maximum produced similar speculation in other articles. Every one bought and sold bread, meat, grocery, oil, vegetables, &c., and the garrets and cellars were filled with goods and eatables, in which every one speculated. White bread sold

at 25 or 30 francs the pound. People went and bought up not only the actual produce in the country, but even the standing crops, and herds of cattle, in order to speculate in the rise of prices. In the meantime the national domains had been put up for sale as decreed,—namely, at three times in Assignats their price in 1790. Hundreds of offers poured in. For one property 360 offers were made, for another, 500. This great success, however, made the Convention believe that they were throwing away the property at a loss, and the decree was repealed.

31. Having thus abandoned the only plan which had hitherto seemed to promise success in reducing the depreciation of the Assignat, it continued to get worse. The Convention then hit upon another plan. They assumed it as a principle that the value of the Assignat must depend on the quantity in circulation. Thus, if an article cost one franc when there were 2,000,000,000 in circulation, it must be worth two francs, when there were 4,000,000,000, and three when there were 6,000,000,000, and so on. A scale was made taking two milliards as the basis, and it was decreed that in all payments in Assignats there should be added one fourth for every 500,000,000 in circulation. But the government were unable to apply this scale to all transactions. It was first adopted in the payment of taxes and their arrears. It was promised to the public functionaries when their numbers were reduced, and the creditors of the state, when the taxes should admit of their being paid in the same scale. The landowners in the Provinces were the only ones who were able to make their tenants pay according to the new scale. In May, 1795, the national property was estimated at 16 milliards, the Assignats created at nearly 12 milliards, of which only 8 milliards less 140,000,000 were in circulation. The sales of the national domains having been put a stop to, there was nothing to check the depreciation of the Assignats. In a few months the issues increased from 12 to 29 milliards, and, notwithstanding the numbers which were returned and cancelled, there were 19 milliards in circulation, or in nominal value, £760,000,000 sterling. The public functionaries could no longer live upon their salaries, and resigned. One-third of the army deserted. When the Directory entered upon their functions in November, 1795, at the Luxembourg, there was not a piece of furniture in it. The keeper lent them four straw chairs, a three-legged table, and an inkstand. They had the foresight to bring with them a writing desk, and letter paper; there was not a farthing in specie in the treasury, and the only means of payment in the morning were the Assignats which were printed during the night. Such was the condition to which a government entrusted with almost unlimited power of creating paper money was reduced to!

32. The Directory devised a plan of raising the value of the paper by liquidating it at one-thirtieth of its value, it having in reality fallen to almost the 300th part of it. This plan, however, was rejected by the Council of the Ancients. They then proposed a forced loan of 600 millions in real value, either specie, or Assignats at their current value. This was adopted, but had no better success than the former plans, and in 1796 the issues amounted to 45 milliards, and a milliard in paper was only reckoned equal in reality to a

million in specie, though the quotations never reached that depression. That is, the Assignat had in reality fallen to the *thousandth* part of its nominal value. What an admirable commentary upon the wisdom of the theory upon which they were founded, that if they only represented some article of solid value like land, their value could never fall below that of gold and silver!

33. Some idea of the terrible fluctuation in the value of property may be formed when we observe the rapidity of the fall in value of the Assignat. It was at par for a short time at the end of 1793, that is, the louis d'or was at 25 paper livres. During 1794 and 1795 it went on depreciating till, at the end of August, the louis d'or was worth 1,020 paper livres. During September it rose gradually to 1,200 livres; during October, to 3,600 livres, at which level it remained during November. In December it rose to 5,100; in January, 1796, to 5,400; and in February to 8,600. But these are merely the highest quotations in each month. It varied several hundred livres in the same day, frequently 500 livres from day to day, and on some occasions 1,000 livres. As a specimen, we may say that on the 23rd October, 1795, the louis d'or was quoted at 1,690 livres; on the 26th, at 2,060; on the 28th, at 2,750; on the 30th, at 3,650; and on the 31st at 2,600. The prices of commodities followed the same fluctuations. In two months the prices of coffee, &c., rose tenfold. Even in August, 1795, an ordinary octavo volume sold for 375 francs.

34. The Directory at length saw that it was necessary to do something effectual to bring the ordinary transactions of life from being mere gambling. The process of obtaining land for Assignats was long and tedious, and it was determined to shorten and simplify it. Accordingly, a new species of paper was devised, which were named *territorial mandates*. The Assignats were secured on some particular estates, and there was consequently much difficulty in appropriating them. The mandates were created at the rate of 30 to 1, and every domain was to be delivered without sale by auction, or any other formality than a mere *procès verbal*, to any one who tendered in *mandats*, a sum equal to twenty-two years purchase at its price in 1790. *Mandats* to the amount of 2,400,000,000 were immediately created, and domains to that amount appropriated to their payment. At the rate of 30 to 1 it was computed that the quantity of Assignats in circulation were equivalent to 800,000,000 in *mandats*. Six hundred millions more were appropriated to the public service, and 1,200,000,000 were to be deposited in a chest with three keys, to be taken out by decree as they were wanted. It was then ordered that the plates of the Assignats should be publicly broken up, and destroyed, on the 19th February, 1796, in the Place Vendome, which was accordingly done.

35. These mandates were created on the 26th Ventose, or 15th March, 1796, and they were then declared the legal tender of the Republic, and all payments were directed to be made in them. The same laws against selling mandates for gold and silver, as against Assignats were enacted, and to prevent, if possible, speculation in the value of the mandat, the exchange was shut up, just as if, says Thiers, the shutting up of the exchange

could prevent private exchanges from springing up by thousands elsewhere. The immediate necessities were so urgent, that the government were obliged to issue promises of mandates, until the mandates themselves were ready. These promises soon fell to a heavy discount, and the mandates themselves had fallen from 100 to 18 francs the day they were issued, 11th April, 1796. It took some time to make the necessary preparations to effect the sale of the domains, and it was spread abroad that the government would refuse to part with them, which depressed the mandates still more. The sales were, however, at length commenced, purchasers flocked in, and the mandat for 100 francs, which had fallen to fifteen, gradually rose to thirty, forty, and sometimes even to eighty francs, and some hopes were entertained that the financial condition would be ameliorated.

36. But these hopes were illusory. The existing issues of Assignats when the mandates were created, were reckoned equal to 800,000,000 of mandates. But 2,400,000,000 had been created. Consequently, the issue of mandates was only the Assignats under another name and form, and to issue that amount of mandates was merely to triple the old circulation of Assignats. The inevitable consequence followed, the mandat soon fell to the same discount as the old Assignat. People refused them altogether in private transactions, and resorted to barter. By getting rid of such a circulating medium commerce began to regain some activity.

37. The continued issues of mandates soon caused them to fall to the same discount as the Assignats, and as they represented thirty Assignats, it followed that the latter had fallen to nearly the 30,000th part of its nominal value. The government then refused to part with the national domains at the depreciated value of the mandat. In the meantime the destruction of the value of all articles had allured foreigners to come there to buy them at a low price. The unhappy proprietors were too glad to sell their most costly possessions, their pictures, statues, wines, and precious stones, for specie. Thus, while the excessive issues of paper had driven specie out of the country, the low prices of all sorts of goods brought it back again, as is always the case in every financial crisis.

38. This second species of paper currency having thus hopelessly failed, the government were at last driven to the only resource that remained. On the 16th July, 1796, the paper currency was destroyed at a blow. It was decreed, that thenceforth any one might make what bargains he pleased, and in what currency he pleased. That the mandates should be taken in future only for their value in specie, and that this value should be published daily at the treasury, and the remainder of the public domains were ordered to be sold for mandates, at their current value.

39. Thus, at length the whole system was destroyed and specie immediately reappeared in circulation, and in the space of about twelve months was entirely and permanently restored to the country, without the least disturbance or inconvenience. The maximum was swept away. The new revolutionary proprietors settled down quietly with such as remained of the old ones, the

freedom of commerce was restored, and social order returned, and this paper currency, after having effected a greater revolution in property, and having been the cause of greater misery, than was ever concentrated into so small a space of time, finally disappeared.

40. Such is merely a short, and, in many respects, a very imperfect sketch of the actual effects of one of the most subtle and plausible theories of currency, but one which has numerous believers at the present day. Nor is it possible to shew its radical error without adopting the fundamental conception of the nature and functions of a currency which we have proposed elsewhere. (CURRENCY. MONEY). We may observe that the speeches of those members of the Assembly, who supported the issues of the Assignats, and who scouted all ideas of the possibility of their depreciation, were received with enthusiastic applause, while those of the wiser ones, who opposed them, and clearly predicted their mischievous consequences, were received either with a dead silence, or disapprobation. So utterly unfit is a popular assembly to decide upon a scientific question. Nor are we to attribute this only to the revolutionary assembly of France. All the phenomena, only on a diminished scale, exhibited by the Assignats, were reproduced twenty years later, by the paper issues of the Bank of England. And the very same fallacies, which found so much favour in the French Assembly, were reproduced, and found equal favor in our own House of Commons in 1811 and 1812. Nay, the House of Commons greatly out-did the French Assembly in absurdity, for it came to a solemn vote that when it required a £1 note and seven shillings to purchase a guinea, that the £1 note was still equal to twenty shillings, whereas the depreciation of the Assignat was always acknowledged, and deplored in the Convention, and strenuous exertions were made, however unsuccessfully, to bring it to par. We shall, in other parts of this work, bring forward other instances of this theory of currency having been adopted, with similar results.

ASSOCIATION. See COMPANY.

ASSURANCE. See INSURANCE.

ATELIERS NATIONAUX.—We have it from the highest authority that the poor will never cease from off the earth, and, in truth, in all densely peopled countries, the question of the poor is one of vital importance. No institutions, however ancient or excellent in theory, no property can be secure in a country where there is a great, fierce mass of starving populace. There is no surer cause of revolution than physical misery. The question of the poor has been of transcendent importance in England, ever since the days of Henry VIII., and, although the evils of the old Poor Law became at last intolerable, and unquestionably greatly aggravated the very evil they were intended to relieve, there can scarcely be any doubt that it contributed greatly to remove one chief cause of political turmoil. It was certainly a heavy price to pay, but it is not easy to see how the country could have escaped a revolution, if a large mass of starving pauperism had been added to all the other inflammatory elements during the fever of the Revolutionary war. That

all laws of this nature strictly belong to Socialism, and are, therefore, violations of Political Economy, is true, but in this case it is a choice of evils, and some sort of a law of this kind seems to be absolutely essential for the peace of society. The question then seems to be, to devise the least obnoxious form of a necessary evil.

2. The question of the poor has been of not less importance in France, than in England, especially since the revolution of 1789, when the religious establishments were swept away, and no efficient substitute, like that of the English Poor Law, was provided. The mode in which the question has been dealt with in that country, is an example of the immense practical consequences that may flow from a slight difference in two expressions, both springing from the same fundamental idea.

3. Although any one capable of reasoning must know, that the unequal distribution of property is a matter of inevitable necessity, and cannot possibly be avoided, yet, at any given time of great public distress, it is sure to excite the strongest jealousy in the minds of the starving poor, and be regarded by them as iniquitous. It is useless at such times to say, that if an equal division were made of all the property in the country, by the end of a week, the able, the strong, and the industrious, would have got possession of the property of the idle, the profligate, and the weak, and the differences would soon be as great as ever. What they want, at such times, is instant relief, and if it is not given them, the certainty is that they will seize it by force.

4. It has then been found absolutely necessary to concede this point, that all persons in this country have a legal right to subsistence, and that the maintenance of the people is the first charge upon the industry of the nation. But the right of subsistence draws with it the correlative right of demanding work in exchange for this maintenance.

5. So far, therefore, it is impossible to deny that the English law and the Socialist doctrine proceed *pari passu*. The difference consists in the turn of a sentence. The Socialist theory demands that the work provided for the workmen shall be such as they are accustomed to, that is, it shall be such as the *recipient* pleases, the principle of the English law is, that it shall be such as the *giver* pleases.

6. The old system of Poor Law, with its system of parish allowances, &c., made a very near approach to the Socialist doctrine; (POOR LAW). But the essential distinction between the New Poor Law and the Socialist theory consists in this, simply that the work provided for the recipient of relief is such as the giver pleases, and not such as he pleases.

7. It is stated by M. M. Cocquelin and Léon Faucher in two valuable articles on the *Ateliers Nationaux* and the *Droit au Travail*, in the *Dictionnaire de l'Economie Politique*, from which much of the following information is derived, that so far back as 1545 edicts had been issued directing the establishment of public workshops for the unemployed. And ordinances were issued in 1685, 1699, and 1709, for the regulation of these workshops. Louis XVI. exerted himself to extend this mode of relief throughout the kingdom, and endeavoured to encourage the establishment

of public works in each province, during the dead season, by privileges.

8. In 1790 the public troubles caused the closing of numerous private establishments, and threw an immense number of workmen out of employment. Vast public workshops were opened in the neighbourhood of Paris, in which the men were employed on earthworks, and women and children in spinning. Beside that, 30,000 francs were put at the disposal of each department, to employ the poor, on a similar plan to that adopted at Paris.

9. The Constitution of 1791 decreed, among the guarantees given to the citizen, "that there should be created and organized a general establishment of public assistance to bring up foundlings, to relieve the infirm poor, and to furnish work to able-bodied poor, who could not procure it for themselves." But this never could be efficiently carried out. Notwithstanding the assistance that was given, the misery of the poor went on increasing, and more and more workshops were every day closed.

10. The Constitution of 1793 was more explicit still in its declaration. It said that "public relief is a sacred duty. Society owes subsistence to unfortunate citizens, either in procuring them work, or in assuring the means of existence to those who are not in a condition to work." This abortive Constitution maintained the doctrine that the State was bound to find enough work for all its members, as should enable them to support themselves.

11. This doctrine was dropped out of the succeeding constitutions, but the *Ateliers de charité* survived; and the law of the 24 Vendémiaire, year XII., contains very minute and precise regulations for them, but it had no greater success than the former attempts. Babeuf drew from it his principle of the community of goods; and it sank deep in the minds of the people, and has formed one of the principal articles of the Socialist creed. M. Léon Faucher quotes from Fourier the following passage, which contains the enunciation of the principle of the *droit au travail*. "Scripture tells us that God condemned the first man and his posterity to work with sweat on their brows; but he has not condemned us to be deprived of that work on which our subsistence depends. We can then, in accordance with the rights of man, request philosophy and civilization not to deprive us of that resource, which God has left us at the worst, and as a chastisement; and to guarantee to us the *right, and the kind of labor*, to which we have been brought up. We have now passed the time to cavil at the rights of man, without thinking of recognizing the most important of all, without which the others are nothing. What a shame to the nations who think themselves clever in social politics! Ought one not to dwell upon such a shameful error, to study the human mind and the mechanism of society, which gives to man all his natural rights, of which civilization cannot guarantee, or admit the principal one, the *droit au travail*?"

12. This newly discovered right of humanity, however, made little progress in public opinion, beyond a small school, for a considerable time, which all its advocates acknowledge to be absolutely incompatible with the rights of property and the existing organization of society. At the

revolution of 1830 these *Ateliers de charité* were tried again, with similar results.

13. During this time, this expression of the *droit au travail* had been working its way in the public mind. Several persons, whose names are more or less notorious, Considerant, Cabet, Proudhon, St. Simon, Louis Blanc, had been busying their brains with schemes to ameliorate the organization of society, and when the catastrophe of 1848 took place, brought about in a great measure by the sufferings from want of work of the populace of Paris, the Socialist party had a grand opportunity of trying the practical effects of their ideas.

14. The revolution of 1848 proclaimed the *droit au travail*. On the 26th February the following decree was placarded on the walls of Paris:

"The provisional government of the French Republic, engages to guarantee the existence of the laborer by work.

"It engages to guarantee work to all the citizens.

"It acknowledges that the workmen ought to associate among themselves, to enjoy the legitimate profits of their work."

15. M. Louis Blanc declares that this decree was forced upon the provisional government by a workman, deputed by the people to insist upon the recognition of the principle of the *droit au travail*, by the Government. Some, however, shrewdly suspect that this alleged workman was nothing more than an agent of some of the provisional government, to coerce their unwilling colleagues. Be that as it may, the "organisation du travail" was decreed. A decree of the 28th February says,

"Considering that the revolution made by the people, should be made for them.

"That it is time to put an end to the long and unjust sufferings of the workmen.

"That the question of work is of great importance.

"That there is none higher or more worthy the attention of a republican government.

"That it belongs above all to France to study deeply, and resolve a problem now proposed to all the industrial populations of Europe.

"That it ought to resolve, without the least delay, to guarantee to the people the legitimate fruits of their work.

"The provisional Government of the Republic decrees:—

"A permanent commission, to be called the *Committee of the Government for the workmen*, will be immediately named, with the express and special duty of attending to their condition."

16. In accordance with this decree, a committee was appointed, with M. Louis Blanc at its head, and installed in the Luxemburg; to carry out the Utopian scheme of finding work for every body. But one result could ensue. It aggravated the misery, distress, and disorganization of labor tenfold. The inflammatory proclamations that emanated from the Luxemburg, destroyed all the remaining relations that existed between the private masters and their workmen. In a great number of establishments, masters and workmen had come to a voluntary agreement, as to the quantity and hours of work, and the rate of wages. The reckless folly of these charlatans upset all

these arrangements. They were forbidden by decree to enter into such engagements. Nor did their meddling stop there. They not only regulated the forms in which work was to be conducted, and paid for, but also its hours. A decree ordered that a day's work should not exceed ten hours, in all trades throughout France. Having thus disordered all the relations between capitalists and workmen, they threatened to appropriate all the manufactories to the use of the State. The masters and contractors, in despair, requested the Government to take all their works off their hands. The committee told them they would, and pay them a large indemnity; but as they had no means of doing so at that time, it must be taken out of the resources of the future. The State would give them obligations bearing interest, secured on the value of the establishments given up, and payable in annuities, or by instalments.

17. The government, by thus meddling with private contracts, soon put all social order in danger. It wanted to appropriate to itself all banks, all credit, all insurance companies, and railroads. Instead of a remedy being provided for the existing distress, it was aggravated a thousand fold. Instead of the existing want of work being provided for, a universal stoppage took place. The Government were then driven to organize the *Ateliers nationaux* in which the State was to be the universal employer, and all the beautiful theories of communism were to be inaugurated. All employments were to be regulated on the same scale, and all wages were equal. Of course the whole mass of workmen and paupers rushed to them. The right of labor, if claimed as a right, was no where considered as a duty. Every one was admitted indiscriminately. The numbers were never exactly ascertained. But while they did not exceed 6,000 in March, they were considered to be not less than 110,000 in June, when the whole resources of society being fast devoured, they were obliged to be broken up at the expense of the terrible insurrection of June; a heavy and conclusive price to pay for the solution of an economic question.

18. It might have been thought that with this terrible experience before their eyes, the French assembly would have been effectually cured of this fatal doctrine of the *droit au travail*, and yet on the 20th June, 1848, only three or four days before one of the most sanguinary civil combats on record broke out, the constitution read from the tribune by M. Marrast, sanctions and confirms in the most explicit terms the doctrines of the Luxembourg. Article 7 says, "The *droit au travail* is that which every man has to live by, his work. Society is bound by all the productive and general means it can dispose of, and which will be organized hereafter, to furnish work to able bodied men who cannot get it for themselves otherwise." Article 9 says, "The right of relief is that which belongs to foundlings, to infirm or old persons, to receive from the State the means of existence." And Article 132 says, "The essential guarantees of the *droit au travail* are, the freedom of labor, voluntary association, equality in the relations between masters and workmen, gratuitous instruction, professional education, provident institutions, and those of credit, the under-

taking by the state of great works of public utility, for the purpose of employing the persons thrown out of work during a stoppage."

19. The committee on the constitution adopted the doctrines of the right of instruction, the *droit au travail*, and the right of relief; that is, of the universal meddling of the State in all the concerns of private life. Nay, after the events of June, eight bureaux out of fifteen admitted the doctrine of the *droit au travail*. Public opinion, however, was roused by this incredible folly, and some modification was made in the extreme terms. The reporter to the commission, M. Marrast, said, (we quote M. Léon Faucher,) "This expression (the *droit au travail*) has appeared equivocal and dangerous; some fear that it is only a premium upon idleness and debauchery, some fear lest the legions of workmen, giving to this right a meaning which it does not bear, should arm themselves as by a right of insurrection. To these important objections they add another more considerable; if the State engages to furnish work to all those who want it from any cause, it ought to supply to each the kind of work he is accustomed to. The State would then become a manufacturer, a merchant, a great or small producer. Charged with the necessities of all, it ought to have a monopoly of all industry. Such are the terrible things they see in our expression of the *droit au travail*, and because it can bear meanings so contrary to our intention, we wish to make our intention more clear and precise, by substituting for the right of the individual the duty imposed upon society. The form is changed, the thing remains the same."

20. The modification proposed did not touch the nature of the thing at all. The clause stood thus in the amended constitution: "Society is bound to protect the citizen, in his person, his family, his religion, his property, his work, and bring to every one's door the education which is indispensable to every one. It owes subsistence to necessitous citizens, either in procuring them work within the limits of its resources, or in giving, in the event of his family not being able to do so, the means of existence to those who are not in a condition to work."

21. Many of the speakers in the debate pushed the doctrine to its extreme limits, and even its adversaries scarcely ventured to call it in question. The opposition to it was embodied in an amendment by M. Blais-Bizoin, in these words: "The Republic recognizes the right of all its citizens to existence by labour, and to relief," but only 187 out of 783 could be found to support this amendment. After a long combat of words the doctrine finally adopted was thus expressed: "The Republic is bound, by a fraternal assistance, to insure means of existence to necessitous citizens, either in procuring them work, within the limits of its resources, or in giving during the inability of the family, relief to those who are not in a condition to work."

22. After giving these details, we shall not further pursue the account of the Socialist doctrines here, which will be fully considered hereafter—(SOCIALISM). We shall merely say a few words with reference to the *droit au travail*. We must never fail to remember in criticising the errors of our neighbours, that the very same false principles infected the legislation of our own country till very recent times. The old poor law

with its system of parish allowances, making up the wages of labour to a certain arbitrary amount, out of the property of the ratepayers, was the very same doctrine, and was fast devouring the property of the country. And if it did not produce the same appalling results as it did in France, the reason appears to be that in England it was chiefly applied in agricultural districts, where the population were scattered, and there was more control over them, and they were not able to combine so readily as the French workmen. The poison, therefore, was more diffused. But in France the doctrine was applied to large masses of town workmen, who were all concentrated into one body of inflammable materials, without the possibility of exacting any work from them.

23. Moreover the system of protection, which so long prevailed in this country, was only another form of Socialism. The *droit au travail* is the right of the workman to have sufficient work and wages provided for him by the State, out of the means of society,—it is the Socialism of the workmen. The system of protection is the right to have remunerative profits provided for the producer by law, out of the means of society,—it is the Socialism of Capitalists. All these are parts of one vicious circle. In fact, Protection and Socialism are incompatible with the rights of property. If manufacturers or agriculturists can compel me to pay ten shillings extra for any commodities I may require, beyond what I could get them elsewhere, in order to provide them with arbitrary profits, what difference in principle is there between that and the workman who maintains the *droit au travail*, when I must employ him and pay him wages when I don't want anything he can produce? The two things are identical.

24. In fact, if the *droit au travail* is an admissible principle at all, it cannot be restricted to handicraftsmen. If the shoemaker is entitled to call upon the State to provide him with shoes to make, when there are no feet to wear them; if the mason is to call upon the State to employ him to build houses, when there is no one to live in them; if the tailor can call upon the State to pay him to make endless coats, when there are no backs to be covered—why, the same law is good for the lawyer, the doctor, the artist, the author, the editor. Every man who chooses to adopt the law as a profession, should have a certain number of briefs deposited by the State every morning upon his breakfast table; every painter should be commissioned to paint endless Madonnas; every sculptor should be employed to produce perpetual Apollos; every author should have a certain number of copies of his work ordered by the State, which criminals, perhaps, might be sentenced to read; every editor should have a certain number of copies of his paper ordered by the State; though it might be somewhat of a puzzle to apply this rule to medical men, as it is not easy to see how the State could provide patients at will.

25. But it may be said that the English law admits the right to relief, and the duty to labor, or, in fact, to demand labor. Is not this then a form of Socialism? What is the difference between that and the *droit au travail*?

26. It must be admitted that the English principle of allowing the right to demand labor and relief, is a form of Socialism, which it has been

found necessary to permit, in order to avoid greater evils, and we may point out what is the essential distinction between the English and French *droit au travail*.

27. The French doctrine demands that work shall be found for the workmen of the nature they are accustomed to. Now, why is it that the workmen in any particular trade are in distress? It is because there is not a sufficient demand for their labor. In fact, because that species of labor is *overabundant*. All commercial difficulties arise from *over production*, in one form or another, and never from *under production*. And all commercial difficulties may be reduced to this general expression, that traders have provided, or got on hand, too much of some commodity than is suitable to the circumstances of the time. And this is equally true, whether it arises from incautious speculation in that particular article, or whether it arises from some great deficiency in some great staple article, as food for instance. Because, if through a great deficiency of food, the price of it rises very high, and takes away the custom from other articles of commerce, which lowers their price, and injures their holders, still the same general expression is true, that they are brought into trouble by having *more* of certain commodities, than is suitable to the circumstances of the time. And this is *over production*, no matter from what cause it arises. To provide more of any article, then, that is already over abundant, can only aggravate the evil. What is really wanted is more demand. Consequently, the only result which those who produce, by extraneous assistance, more than is wanted, can effect, is to aggravate and extend still further the area of suffering, and to reduce those who can maintain themselves, to the same state as those who are already dependent on the public.

28. Consequently, if the right to labor be admitted, which it is in this country, it is indispensably necessary that the work provided should be of some nature wholly different from the workman's usual occupation, and, indeed, it ought to be work which does not come into competition with any independent workman. These remarks apply, of course, chiefly to the ordinary trades, where articles are exposed to sale. The least exceptionable form of public works, are those which increase the demand for work, but do not increase the quantity of any article for sale. But even these are open to the grave objection of attracting large bodies of men into them, much beyond what would naturally be the case, if all employments were left to the natural law of supply and demand. And then having thus attracted these large bodies of men, unless the artificial stimulus is constantly maintained, they are full of peril. There can be no doubt that most of those marvellous improvements in Paris, which have been effected within the last few years, spring from the stern necessity of finding some employment for the people. They are, in fact, in many respects only a substitute for a poor law. When some English are somewhat a little too inclined to be enamoured with despotism, and grumble at the slow and cumbrous movements of a constitutional machine, they may perhaps remember the perilous condition that exists, of maintaining these multitudes by new expedients. (POOR LAWS. SOCIALISM.)

ATTWOOD, THOMAS.—A member of a Birmingham banking firm, who was of strong radical principles, and represented Birmingham for some time, in the Reformed Parliament. He was a man of considerable ability in many respects, but chiefly remarkable for some extremely extravagant and chimerical opinions on the Currency Question. It appears that he inoculated some of his fellow townsmen with some of them, but as they have never made any progress in public opinion, and are utterly visionary, it would be mere waste of time to enter into any account of them. Nothing but his business and position as a banker, could ever have given them the least importance, and it is only one example among thousands, that practical men are frequently the most visionary of dreamers.

Observations on Currency, Population, and Pauperism. 1 Vol. 1818.

Examination before the Committee of the House of Commons on the Bank Charter. 1832.

AUBERT DE VITRY, FRANCOIS JEAN PHILIBERT.

—Born at Paris, 2nd April, 1765. He began to study law, but abandoned it for politics. He attached himself to the Jacobins, for which he had to fly. He retired to Caen, and joined the Girondins; he was afterwards arrested and brought to Versailles. Under the Directory he obtained diplomatic employment, and he afterwards held several appointments in the ephemeral kingdom of Westphalia. His literary works are very numerous, comprising frequent contributions to various periodicals and encyclopædias. He opposed some of the doctrines of Malthus. He afterwards fell into great poverty, and though he received a small pension from government, he died in a public hospital, in June 1849.

Recherches sur les vraies causes de la misère et de la félicité publique; ou, de la population et des subsistances. Paris, 1815.

Essai sur les colonies militaires de la Russie. Paris, 1826.

Essai sur l'Algérie, considérée comme colonie, et sous le rapport de la politique intérieure et extérieure de la France.

Essais d'économie publique et sociale.

AUBERT DU PETIT-THOUARS.—Member of the Council-General of the Department of the Indre-et-Loire.

Plan d'une égale répartition de l'impôt foncier entre les départements, les arrondissements, les communes et les contribuables, et moyen de reconnaître le revenu territorial de la France, et la quotité de l'impôt relativement à ce revenu. 1802. G.

AUBUSSON, LE VICOMTE D'.

Modèle d'un nouveau ressort d'économie politique; ou, Projet d'une nouvelle espèce de banque, qu'on pourra nommer Banque rurale. Amsterdam, 1772. G.

AUCKLAND, LORD. See EDEN, WILLIAM.

AUDIFFRET, MARQUIS D'.—Was born at Paris, 10th October, 1787. He filled several subordinate offices in the Financial Department of the Government, and was appointed President of the Court of Accounts in 1830, and Peer of France in 1837, and President of the Commissioners of the Sinking Fund. He organized and effected great reforms in the system of public accounts.

Examen des revenus publics. Paris, 1839.

Système financier de la France. Paris, 1840.

Le Budget. Paris, 1841.

La libération de la propriété, ou Réforme de l'administration des impôts directs, et des hypothèques. Paris, 1834.

La crise financière de 1848. Paris, 1848.

Réforme de l'administration financière des hypothèques. Paris, 1851. G.

AUDIGANNE.—Born at Antwerp in 1814. Head of a department in the Ministry of agriculture and commerce. He has published in the *Revue des Deux-mondes* several articles on Political Economy.

De l'organisation du travail. Paris, 1848.

L'industrie Française depuis la révolution de Février. Paris, 1849.

Les ouvriers en famille. Paris 1850. G.

AUDOUIN, FRANCIS XAVIER.—Born at Limoges in 1766. Vicar in 1791 of a parish in Limoges, and an ardent revolutionist, he was appointed a commissioner to La Veuclée to collect information regarding the revolt. He was a fiery Jacobin, and particularly fierce against England. He afterwards held several official appointments, and died 22 July, 1837.

Du Commerce maritime, et de son influence sur la force, et la richesse des Etats. 2 vols. Paris, 1800.

AUDRA, JOSEPH.—Born at Lyons, 1714. Became an ecclesiastic and Abbé, and Professor of History at Lyons and Toulouse. He was very intimate with Michaudière, the intendant of Lyons, and with his assistance composed his Inquiry into the population of Lyons, &c., which was published in the name of Messance, the secretary of the Intendance. He published many Historical works which gained the approbation of Voltaire, and D'Alembert, but which excited much public clamor. Brienne, the Archbishop, defended him as long as he could, but the opposition was so fierce, that he was obliged to remove him from his office. Audra died of grief, 17 September, 1770.

Recherches sur la population des généralités d'Auvergne, de Lyon, de Rouen, &c. Paris, 1766.

AUFFRAY, JEAN.—Born at Paris, in 1733. He was one of the Economists, and an intimate friend of Dupont de Nemours, Baudeau, and others. He commenced his career as an author at 20, by maintaining the proposition that printing did more harm than good to literature. In 1767 he was elected a member of the Academy of Metz, and in 1769 of that of Marseilles. He died in 1788.

Le luxe considéré relativement à la population et à l'économie. Lyons, 1762.

Ideas patriotiques sur la nécessité de rendre la liberté au commerce. Lyons, 1762.

Discours sur les avantages que le patriotisme retire des sciences économiques. Paris, 1767.

Considerations sur les manufactures dans les villes maritimes et commerçantes. Paris, 1768.

AUGER.—No biographical traces of this writer are to be found.

Mémoires pour servir à l'histoire du droit public de la France, en matière d'impôts. Brussels, 1779.

Barbier pronounces this to be a very valuable work.

Traité sur les tailles, et les tribunaux, qui naissent de cette imposition. Paris, 1788.

AUGIER, MARIE.—Was, in 1848, one of the Editors of the *Réforme*.

Du crédit public, et de son histoire depuis les temps anciens jusqu'à nos jours. Paris, 1842. G.

AVRIL, J. B.—President of the tribunal of commerce of Nevers.

Question du Libre-échange, mise à la portée de toutes les intelligences. Paris, 1847.

AVRIL, VICTOR.—An advocate at Mézières. *Histoire philosophique du crédit.*

La communauté c'est l'esclavage et le vol. Paris, 1848.

AXIOMS AND DEFINITIONS.—We shall treat of Definitions and Axioms together, because they are so inseparably associated that, to consider them in distinct articles, would involve much repetition.

1. The transcendent importance of the subject will, we fear, detain us at considerable length, but yet not at one by any means sufficient to do adequate justice to it. Because it is one that affects the very nature itself of Political Economy, it determines its rank and position among sciences in general, and its method of treatment, and the degree, and the extent of the certainty of its results. And we shall have to do this at greater length, because we have the misfortune to be at entire variance on every one of these points, with the author of the latest and most extensive treatise on the subject in the English language—Mr. John Stuart Mill.

2. It is perfectly well known, that each of the physical sciences, which have attained such great magnitude and extent in modern times, and which have produced such admirable results, have been brought to their present state of perfection by extraordinary labour being bestowed in ascertaining and settling their first elements—namely, their Definitions and Axioms, or accurate conceptions and expressions of the objects they treat about, and the general laws which regulate their relations to each other. Every one of these wonderful sciences has been brought to their present state by obtaining a few fundamental conceptions, which have been uniformly adhered to throughout their whole range, and anything inconsistent with them has been invariably rejected.

3. But it has not always been so. These beautiful studies were once in a very different

state. The modern plan of teaching a science only in its existing state, no doubt imparts a vast amount of actual knowledge. But as a mental discipline, or as a matter of education, the History of Science is of enormous value, and we venture to think, is far too much neglected. Many persons can "cram" up a considerable amount of actual knowledge, and yet derive very little benefit. But to study the History of Ideas on the subject, to understand clearly the principles of the different controversies that have been waged, and to comprehend why one set of ideas prevailed over another, is an educational exercise of immense utility, which is almost entirely neglected. Few persons are aware of the wrecks of the fierce controversies which lie buried beneath the calm and placid surface of modern science, like those of mighty armaments below the summer sea.

4. Many persons are apt to think that controversies in Political Economy are mere logomachy, vain and unprofitable disputes about words, and of no real consequence. They are apt to think that the Physical Sciences treat about things, and Political Economy only about words. But those who think so, display a total want of knowledge of the History of Science. The early history of all science is full of controversies about the meaning of words. Many may think that physical science being about things, there is no difficulty in giving a name to what is seen so readily. This is a lamentable error. On the contrary, it almost invariably happens that names get into a science, and acquire a position in it, before any one can tell what they mean. Thus, in Mechanics, the words *Momentum*, *Vis Viva*, *Uniform Force*, *Accelerating Force*, and several others, acquired a position in it, before any one could tell what they really meant, and all the philosophical world of the day was engaged in the wordy war to settle their meaning, and obtain true definitions. Consequently it is an entire error to suppose that controversies in Physical Science are not about words. On the contrary, it was in the true definitions of words that the whole foundation of the sciences were laid. And it was just because all the great mathematicians of the day so thoroughly understood the supreme importance of ascertaining the true meaning of words, and fought out the meaning of each separate one with such perseverance, that they at length arrived at such an unanimity of agreement, and these controversies have now been almost forgotten. There was a time then, when what are called the exact sciences had not attained that rank. They were once matters of *opinion*, and not of *demonstration*, and they only attained the rank of demonstrative truth, because each separate word, and each separate principle was thoroughly discussed and settled.

5. And why has Political Economy not yet attained the same rank as Mechanics as an exact science? Because the same care has never yet been given to settle its definitions and axioms. Political Economy is now, like Mechanics in its early stages, overrun and infested with words whose meaning has never yet been settled on certain principles, and which are never almost used by any two writers in the same sense, nay, few even of the best writers are consistent with themselves. The men who have cultivated Political Economy are probably of as great natural

ability as those who have cultivated physical science, of course with the exception of a few unapproachable examples. Why, then, have they not come to the same unanimity of opinion as their brethren? The simple reason is that they have not adopted the only means that could by any possibility ensure success, namely, a thorough discussion and settlement of the meanings of words, nay, they have systematically despised it. Now, what the words *Momentum*, *Vis Viva*, &c., were to mechanical science in its early stages, that *Value*, *Currency*, *Capital*, &c., are at the present day to Political Economy.

6. And it is for this very reason that many suppose that Political Economy cannot be made an exact science, because the only means that can make it so have been systematically neglected. Many, however, suppose that there is no use for such a thing; matters will go on just the same, they think, for all the disputes. But the same may be said of physical science; a man may be an excellent seaman and yet be entirely ignorant of the principles which cause his vessel to go in a direction nearly contrary to the wind. But is there no use in the science of Mechanics? So, doubtless, a man may be an excellent banker, and a very successful practical merchant, without any knowledge of Political Economy, and yet is there no use of Political Economy? This science stands to the phenomena of commerce exactly in the same relation that the science of Mechanics does to practical seamanship, &c.; for Political Economy is the science which treats of the laws which regulate the exchangeable relations of quantities, just as Mechanics is the science which treats of the laws which regulate the motion of bodies.

7. Now, adopting this conception of the pure science of Political Economy, we affirm that it depends upon certain fundamental conceptions, or definitions and axioms, exactly as Mechanics does, and that by settling these with as great care as is done in physical science, it may be raised to the rank of an exact science. That it contains an immense body of *demonstrative* truth, and that it is capable of exactly the same kind and degree of certainty as the laws of Mechanics, that is to say, that it may be perfectly demonstrable that such and such effects are due to such and such causes; though it may not be possible to say *how much* of a cause will produce any given amount of effect, which can only be ascertained by experiment.

8. And yet there are writers, of no mean acquirements too, who entirely discourage such a course of proceeding, who consider such attempts as pedantic, and mere waste of time—who would admit that in every other branch of human knowledge clear and precise technical terms are absolutely indispensable, and yet in Political Economy alone, think there is no need of anything of the sort. Now we affirm, that if Political Economy is ever to emerge from the turbid regions of controversy and *opinion* into the serene atmosphere of *demonstration*, it can only be done by Economists laying aside the unhappy idea that controversies about words are unimportant and superfluous, by following the example of their brethren the Physicists, who have cleared their path to such brilliant success, and by bringing their whole force to discuss and settle the first elements of the subject, namely its Definitions and Axioms. And when this is

done, it will be found that Political Economy is a science, as clear, as precise, and as sharply defined, and as capable of being erected into an exact science as any other whatever.

9. Most persons have a kind of dreamy, vague notion that Adam Smith, Ricardo, and Archbishop Whately are eminent Political Economists, and probably class them together, as they would any of the eminent cultivators of any of the exact sciences. But not many, perhaps, except those who have made Political Economy a serious study, are aware that the most irreconcilable differences of principle exist among them. We have shown (PRELIMINARY DISCOURSE) that the constructive part of the *Wealth of Nations* is founded upon two distinct, opposing, and contradictory conceptions of the nature and measure of value. The one in which value is measured by *labor*, the other in which it is measured by *exchangeability*, and these two antagonistic conceptions are intertwined and interlaced throughout the whole course of the work. Ricardo clearly saw the inconsistency of these two conceptions, and that one, at least, must be entirely rejected. Under the name of *Cost of Production*, he has substantially adopted Adam Smith's measure of value by labor, and entirely rejected that of Exchangeability. Thus Ricardo destroyed one half of the *Wealth of Nations*.

10. But Archbishop Whately has shown that Ricardo adopted the *wrong* half of Adam Smith. In the passage quoted in the Preliminary Discourse, it is shewn that Exchangeability is the measure of Value, and not Cost of Production. Thus Archbishop Whately and Ricardo are diametrically opposed to each other. The Archbishop says that Ricardo's work is one "long enigma," from his fundamental error about the measure of value. It is not as if Ricardo had made some great discovery in the subject, and the Archbishop had carried it out, and extended it. But they are absolutely opposed to each other on the very fundamental conception of the subject. For the same man to believe in Ricardo and Whately at the same time is a moral impossibility. The same man could no more believe in them both at the same time, than he could believe in the Ptolemaic and the Copernican Astronomy at the same time, or in the phlogiston and oxygen theory of chemistry at the same time. Whately and Ricardo are antagonistic to each other, not complementary, but contradictory.

11. There is then no possibility of compromise between them. One or the other is totally wrong. Now, as these are no trivial matters, but go to the very root of the subject, Economists ought to argue out the question to the very bottom, and come to an agreement. Physicists would have come to a decision long ago on a matter of such vital importance in their science. But how is the matter to be settled? In the conflict of opinion how are we to decide which is to prevail? We answer that the identical principles which governed the decision in Physical science, will settle the matter in Political Economy. The decision in the matter is to be governed by the well settled laws of *INDUCTIVE PHILOSOPHY*.

12. It has been the fashion lately of a certain class of writers systematically to depreciate the merits of Bacon, and some almost seem to go the length of nearly denying him any merit at all, because it cannot be shewn that the *Novum Orga-*

must have had any direct influence upon the progress of physical discovery. He made no discovery himself, and the progress of physical discovery would have been just as great if he had never written. That these assertions may be very possibly true, does not diminish the lustre of that work in the very least in our opinion. No one can fairly appreciate the merit of that work who is not aware of the absurdity of the grounds upon which the established opinions of his day on physical science rested. Bacon saw through this, and discerned the weakness of the grounds of the current belief with a clearness and penetration truly surprising. One reason perhaps why he may not have received his due share of credit, is that he over-estimated the power of his Logic, and supposed that by its means discoveries could be made, so that almost all minds could be brought nearly to the same level, and make discoveries as equally as they could draw circles by compasses. That he entirely failed in this is true, and it is probable that his failure in that instance has had some effect in making his real merits less thought of than they deserve. But he failed in this instance, by not paying attention to his own rules. For he has laid down that the conceptions of a science are to be framed with exactly the same care as the axioms. And he fell into exactly the same error himself, as he had charged upon the Aristotelians, namely, considering Logic as an instrument of discovery. Whereas, the fundamental conception of Logic is not the art of discovering truth, but the science of JUDGING, whether or not certain alleged discoveries are true. Logic is the science of judgment, and not an art of discovery, or even of reasoning. Logic discovers and applies the tests which any proposition must satisfy, before it can be admitted to be true. Cicero has described once, and for ever, the true functions of Logic, *De Oratore*, II., 38. "In hac arte, si modo est hæc ars, nullum est præceptum, quo modo verum *inveniat* sed tantum est, quo modo JUDICETUR." When, therefore, we separate what falls within the limits of this conception, from what transgresses it; when we consider that in his day there was not one single science from which he could draw his observations, there is no candid mind but must be astonished at his penetration and sagacity, in anticipating the science of sciences. No one can dispute the merit of Aristotle in discovering the syllogistic mode of reasoning, nor can blame him because his injudicious followers pushed it far beyond what he ever intended. But Aristotle founded his system *inductively*; he framed it by observing what examples of reasoning were acknowledged to be valid by common consent. Bacon founded his system *à priori*, with no single instance in existence of an Inductive Science; and though no doubt great additions have been made to it in modern times, yet the amount of success he did achieve is truly marvellous. By a curious whim of fortune, the chief of the school of *à priori* reasoners founded his system inductively; the chief of the inductive school of logic founded his system *à priori*.

13. But notwithstanding the general admiration in which his works have been held by the wise and learned in all countries, it seems to us that one of his most striking and original merits has never been sufficiently appreciated, and we

must enlarge upon it, because it has special reference to our present subject.

14. When the greatest moral philosopher of antiquity attempted to master the physical science of his day, he found that everything in it was a mere chaos of confusion, a mass of baseless dogmatizing, and vain speculation. He called off his disciples in blank despair from such unprofitable labor, and bade them devote themselves to the study of moral science, which was within their comprehension, and to know just so much of natural science as to know when to sow, and to reap, and to sail; nay, he considered those who engaged in such objects of contemplation as wanting good sense. He used to inquire whether such persons thought they already knew enough of human affairs before they proceeded to such subjects of meditation. He thought that men never could come to a satisfactory conclusion on such points, because those who thought themselves the most learned in them, were altogether at variance with each other. As for himself he would abandon all such vain speculations, which never could have any practical utility, and turn his attention entirely to moral and civil philosophy, and all things which concerned mankind. Thus physical and moral science were utterly divorced in ancient times, and for twenty centuries it was supposed that there was no connexion between the two.

15. But Bacon, greatly wiser,—and for this he has never received the thousandth part of the credit that is due to him—had the marvellous sagacity to perceive that in Natural Science were to be found the types and standards of reasoning, which were to guide us in Moral and Political Science. He inculcates the study of Physical science, it is true, for its own sake, but not for its own sake only, but as the foundation of Moral Science. After shewing that one cause of the backward state of the sciences was the short period during which they had been studied, he says, *Nov. Org.*, Book I., Aph. 79, "In the second place, there presents itself that cause of great weight in every way, namely, that during those very ages in which the genius and learning of men have chiefly flourished, NATURAL PHILOSOPHY obtained the least part of human labor. And, nevertheless, this very thing ought to be held to be the GREAT MOTHER OF THE SCIENCES. For all arts and sciences, if torn from this root, though perhaps they may be polished and made fit for use, yet they will make no further progress. * * * * * And the age during which Natural Philosophy was seen to flourish in Greece, was but a very brief interval of time, for both in the more ancient times, the seven who were called the wise men, all except Thales, applied themselves to moral philosophy and civil affairs; and in later times, when Socrates drew down philosophy from heaven to earth, Moral Philosophy prevailed more and more, and turned the minds of men from the Philosophy of Nature." So Aph. 80. "To this it is to be added that Natural Philosophy, even among those very men who have nurtured it, has scarcely ever obtained the whole leisure and employment of any one, especially in these later times; except, perhaps, some instances of a monk in his cell, or a gentleman speculating in his country house. But the Philosophy of Nature has been made, as it were, a passage and a bridge

to something else. And so this *great Mother of the Sciences* has been, with wonderful indignity, thrust down to the office of a handmaid. * * *

* * * *Meanwhile let no one expect much progress in the Sciences, (especially in the practical part of them), UNLESS NATURAL PHILOSOPHY BE APPLIED TO EACH INDIVIDUAL SCIENCE, AND EACH PARTICULAR SCIENCE BE REFERRED AGAIN TO NATURAL PHILOSOPHY.* Hence it is that astronomy, optics, music, most of the mechanical arts, medicine itself, and—what one might more wonder at—MORAL AND POLITICAL PHILOSOPHY, logical sciences have scarcely any depth, but only glide over the surface of a multitude of things, because after these separate sciences have been once distributed and erected, they are no longer nourished by Natural Philosophy. * * * Therefore, it is not the least strange if the sciences make no progress, when they are torn from their roots."

16. So also *Aph.* 107. "And here it may be repeated, what was said above, about the application of Natural Philosophy, and that each separate science must be referred to that again, that the sciences may not be severed and cut off from the trunk. For without this little progress is to be hoped for." Also *Aph.* 127.—"Some, too, may doubt rather than object, whether we speak of Natural Philosophy only, or that the other sciences, logic, ethics, politics, are also to be brought to perfection by the same method. But most assuredly we mean what we said to apply to them all; and, as the common logic, which acts by syllogism, affects not only the natural, but *all* sciences, so also ours, which proceeds by induction, embraces them all. For we form a history, and tables of discovery, of anger, fear, shame, and the like, also of examples in Politics, so also of affections of the mind, &c."

17. So also *De Augmentis, Lib. IV.*, c. 1. "Let us now come to that knowledge, to which the oracle of old leads us—namely, the knowledge of ourselves, upon which, as it touches us the more nearly, the more diligence is to be bestowed. This knowledge is, for men, the aim and the object of all knowledges, but it is only a portion of nature. And let this be laid down as a general rule, that all divisions of sciences be so understood and applied, that they may rather mark and distinguish them, than separate and divide them. *So that we may always avoid a break of continuity in the sciences.* For the contrary mode has made each separate science barren, empty, and erroneous, since they were not nourished, supported and corrected, by the common fountain and aliment." So also *De Augm.* III., 4. "We have laid down that this is the function of Natural Philosophy, to be the common mother of the sciences."

18. Now, Bacon has, beyond all doubt, the sole, undivided, and transcendent merit of discovering that the reasoning in Natural Science is the type and the model of reasoning in Moral and Political Science, and that, whatever in the latter clearly and manifestly violates the method in the former, is to be infallibly condemned. And yet J. B. Say had read Bacon with such extraordinary carelessness and inattention, as to say "Bacon ignorait complètement, que la même méthode était applicable aux sciences morales et politiques, et qu'elle y obtiendrait des succès du même genre!" (*Cours d'économie politique. Vol. II.*,

p. 550. *Edit Guillaumin*). And this great truth, which was first seen and proclaimed by Bacon, has been repeatedly enforced by the most eminent men since. Newton says that an extension of our knowledge of the laws of Natural Philosophy would certainly extend our knowledge of the laws of Moral Philosophy. So, too, Bishop Butler, "There is a much more exact correspondence between the *natural* and the *moral* world than we are apt to take notice of." *Sermon VI. On Compassion.* A general officer lately addressing the students at a military institution, earnestly pressed the study of Chemistry upon the young officers, because he said he had often found the laws of Chemistry of great practical use in the affairs of life. And Mr. Mill, to whose opinions on the proper method of the treatment of Political Economy we shall shortly advert, exactly in the spirit of the extract from Bacon, we have quoted above, says, "Although the scientific arrangements of organic matter, afford as yet the only complete example of the true principles of rational classification, whether as to the formation of groups or of series, those principles are applicable to all cases in which mankind are called upon to bring the various parts of any extensive subject into mental consideration. They are as much to the point when objects are to be classed for purposes of art or business, as for those of science. *The proper arrangement, for example, of a code of laws, depends on the same scientific conditions as the classification in Natural History*, nor could there be a better preparatory discipline for that important function, than the study of the principles of a natural arrangement, not only in the abstract, but in their actual application to the class of phenomena for which they were first elaborated, and which are still the best school for learning their use." (*Logic II.*, 282.) And again, p. 358. "These aberrations in medical theory, have their exact parallel in politics."

19. Thus we see that Mr. Mill is in exact harmony on this point with Bacon, Newton, and others, who have made the same remark often since. That is, he admits that the principles of the classification of laws is to be founded on the model and type of the classification of Natural History; that is, he observes the continuity of science between Legislation and Natural History, making both a part of Inductive Philosophy; but when he comes to Political Economy, he absolutely extrudes it from Inductive Science altogether. He breaks the continuity of science between Political Economy and Physical Science, and maintains that in Political Economy, the *a priori* or dogmatic method, is the only true one. And this is his settled opinion on the subject, and he repeats it over and over again. Thus, in his *Essays upon some unsettled questions of Political Economy, Essay V. on the Definition and Method of Political Economy*, p. 141, after some remarks upon the importance of ascertaining the correct definition of the science, in which we entirely agree, he says, "with the consideration of the definition of a science is inseparably connected that of the philosophic method of the science; the nature of the process by which its investigations are to be carried on, its truths to be arrived at."

"Now, in whatever science there are systematic differences of opinion—which is as much as to say in all the Moral or Mental Sciences, and in

Political Economy among the rest; in whatever science there exist among those who have attended to the subject, what are commonly called differences of principle as distinguished from differences of matter-of-fact, or detail—the cause will be found to be a difference in their conceptions of the philosophic method of the sciences." Also p. 143, "In the definition we have attempted to frame, of the Science of Political Economy, we have characterized it as essentially an *abstract science*, and its method as the method *à priori*. *Such is undoubtedly its character as it has been understood and taught by all its most distinguished teachers.* It reasons, and, as we contend, it must necessarily reason from assumptions, not from facts. It is built upon hypotheses, strictly analogous to those which, under the name of definitions, are the foundation of the other abstract sciences." Again, p. 145, "This ought not to be denied by the Political Economist. If he deny it, then, and then only, he places himself in the wrong. The *à priori* method which is laid to his charge, as if his employment of it proved his whole science to be worthless, is, as we shall presently shew, the only method by which truth can possibly be attained in any department of the Social Science." Also, p. 146, "But we go further than to affirm that the method *à priori* is a legitimate mode of philosophical investigation in the moral sciences; we contend that it is the only mode. We affirm that the method *à posteriori*, or that of specific experience, is altogether inefficacious in these sciences as a means of arriving at any considerable body of valuable truth; though it admits of being usefully applied in aid of the method *à priori*, and even forms an indispensable supplement to it."

20. We shall postpone the consideration of Mr. Mill's reasons for maintaining this doctrine until we have investigated what grounds he has for an assertion of a matter of fact. He says that *all* the most distinguished Political Economists have treated it as an *à priori* science. From this statement of fact, with all due respect for Mr. Mill, we must entirely dissent. It is true that some have done so, among others Quesnay, its founder in modern times, and others; but we wholly deny that the economists to whom the science is most indebted have done so. Adam Smith undoubtedly did not do so, his work is peculiarly remarkable as one in which abstractions are laid aside, and actual phenomena are discussed and explained in a familiar manner. J. B. Say, who stands next in order of time and merit to Adam Smith, and who, in fact, did the same service to the continent, that Adam Smith did to England, namely, made it popular, expressly condemns the *à priori* method, and repeatedly declares that it is a science of pure *observation*. Nay, in the very passage we have cited above, exhibiting such an extraordinary instance of carelessness, the very charge he brings against Bacon is, that he did not see that the identical method to be applied to Physical Science, was the one to be followed in Moral and Political Science, and would be attended with the same kind of success. He also says, (*Discours Préliminaire, Traité d'économie politique, p. 3, édit. Guillaumin,*) "En économie politique, comme en physique, comme en tout, on a fait des systèmes avant d'établir des vérités; c'est-à-dire, qu'on a donnée pour la vérité des conceptions gratuites, de

pures assertions. Plus tard, on a appliqué à cette science les méthodes qui ont tant contribué, depuis Bacon, aux progrès de toutes les autres; c'est-à-dire, la méthode expérimentale, qui consiste essentiellement à n'admettre comme vrais, que les faits dont l'observation et l'expérience ont démontré la réalité, et comme des vérités constantes que les conclusions qu'on en peut tirer naturellement; ce qui exclut totalement ces préjugés, ces autorités, qui en science comme en morale, en littérature comme en administration, viennent s'interposer entre l'homme et la vérité." So page 5. "L'économie politique qui est une science expérimentale * * * L'économie politique, telle qu'on l'étudie à présent est tout entière fondée sur des faits, car la nature des choses est un fait, aussi bien que l'événement qui en résulte." So page 6. "L'économie politique est établie sur des fondemens inébranlables, du moment que les principes qui lui servent de base, sont des déductions rigoureuses de faits généraux incontestables." And so far from sanctioning the *à priori* method of treating Political Economy, he expressly condemns those who do so. He says at p. 15, "D'autres considérations non moins délicates se rattachent à ce qui précède. Quelques écrivains du dix-huitième siècle et de l'école dogmatique de Quesnay d'une part, et des économistes Anglais de l'école de David Ricardo d'une autre part, sans employer les formules algébriques trop évidemment inapplicables à l'économie politique, ont voulu y introduire un genre d'argumentation, auquel je crois, en thèse générale, qu'elle se refuse de même que toutes les sciences qui ne reconnaissent pour fondement que l'expérience: je veux dire l'argumentation qui repose sur des abstractions. * * * Quand on admet pour fondement, au lieu d'un fait bien observé, un principe qui n'est fondé lui-même que sur une argumentation, on risque d'imiter les scholastiques du moyen-âge qui discutaient sur des mots, au lieu de discuter sur des choses, et qui prouvaient tout; hors la vérité." And he gives instances where he considers, and justly in our opinion in one at least, Ricardo and McCulloch to have fallen into error by adopting this method, and he dwells upon the mischief produced in the science by adopting this method. "Il s'en est suivi d'interminables discussions, où les contendans semblent avoir eu pour bruit, non de répandre l'instruction, mais de se convertir mutuellement; où chacun en oubliant le public, n'a cherché qu'à soutenir son dire; de là des controverses quelquefois peu intelligibles, souvent ennuyeuses, et qui ont eu ce fâcheux effet, que les gens du monde ignorant les solides bases sur lesquelles l'économie politique repose, ont pu croire qu'elle était retombée sous l'empire des systèmes, et des opinions individuelles, que l'on n'était d'accord sur rien." He then more particularly censures the method adopted by Quesnay. He says, page 24, "Au lieu d'observer d'abord la nature des choses, c'est-à-dire, la manière dont les choses se passent, de classer leurs observations, et d'en déduire les généralités, ils commencèrent par poser des généralités abstraites qu'ils qualifiaient du nom d'axiomes, et où ils croyaient voir briller par elle-même l'évidence. Ils cherchaient ensuite à y ramener les faits particuliers, et en deduisaient des règles; ce qui les engagea dans la défense de maximes évidemment contraires au bon sens, et à

l'expérience des siècles." While fully acknowledging their excellence as men, and also the real services they performed to the State, he says, page 25, "Mais d'un autre côté les économistes ont fait du mal, en décrivant plusieurs maximes utiles, en faisant supposer par leur esprit de secte, par le langage dogmatique et abstrait de la plupart de leurs écrits, par leur ton d'inspiration, que tous ceux qui s'occupaient de semblables recherches, n'étaient que des rêveurs dont les théories, bonnes au plus pour rester dans les livres, étaient inapplicables dans la pratique." He also censures Condillac for following their method, page 26, "Comme les économistes il fonde presque toujours un principe sur une supposition gratuite, et il en fait l'aven dans sa préface; or, une supposition peut bien servir d'exemple pour expliquer ce qui démontre le raisonnement appuyé sur l'expérience, mais ne suffit pas pour établir une vérité fondamentale. *L'économie politique n'est devenue une science qu'en devenant une science d'observation.*"

21. He then points out that Adam Smith pursued exactly the opposite method, namely, the inductive method of deducing principles from facts, and says, p. 29—"Lorsqu'on lit Smith comme il mérite d'être lu, on s'aperçoit qu'il n'y avait pas avant lui d'économie politique." Also he says, p. 29, "Avant Smith on avait avancé plusieurs fois des principes très vrais: il a montré le premier pourquoi ils étaient vrais. Il a fait plus: il a donné la vraie méthode de signaler les erreurs; il a appliqué à l'économie politique la nouvelle manière de traiter les sciences, en ne recherchant pas ses principes abstractivement, mais en remontant des faits les plus constamment observés, aux lois générales dont ils sont une conséquence. De ce qu'un fait peut avoir telle cause, l'esprit de système conclut la cause; l'esprit d'analyse veut savoir *pourquoi* telle cause a produit cet effet, et s'assurer qu'il n'a pu être produit par aucune autre cause. L'ouvrage de Smith est une suite de démonstrations qui ont élevé plusieurs propositions au rang de principes incontestables, et en ont plongé un bien plus grand nombre dans ce gouffre où les idées vagues et hypothétiques, les imaginations extravagantes, se débattent un certain temps avant de s'engloutir pour toujours."

22. Thus, we see that Mr. Mill's assertion that *all* the most distinguished Economists have considered Political Economy as an *à priori* science, and have treated it so, is completely disproved. And we entirely concur with, and adopt these views of Say. So far from *all* the most distinguished Economists having adopted this method, it is only Ricardo and his followers who have done so in this country, and, as we shall endeavour to shew, with the most pernicious consequences.

23. Having thus shewn that Mr. Mill is completely in error in his allegations of fact, we shall now examine his reasons for considering, and laying down in such decided terms, that Political Economy can only be treated in the *à priori* method. He says (*Essays, &c.*, p. 146), "There is a property common to almost all the moral sciences, and by which they are distinguished from many of the physical; this is that it is seldom in our power to make experiments in them. In chemistry and natural philosophy, we can not only

observe what happens under all the combinations of circumstances which nature brings together, but we may also try an indefinite number of new combinations. This we can seldom do in ethical, and scarcely ever in political science. We cannot try forms of government, and systems of national policy, on a diminutive scale in our laboratories, shaping our experiments as we think they may most conduce to the advancement of knowledge. We, therefore, study nature under circumstances of great disadvantage in these sciences, being confined to the limited number of experiments, which take place (if we may so speak) of their own accord, without any preparation or management of ours; in circumstances, moreover, of great complexity, and never perfectly known to us, and with the far greater part of the processes concealed from our observation.

"The consequence of this unavoidable defect in the materials of the induction is, that we can rarely obtain what Bacon has quaintly, but not unaptly, termed an *experimentum crucis*," also, p. 149, "Since, therefore, it is vain to hope that truth can be arrived at, either in Political Economy, or in any other department of the Social Science, while we look at the facts in the concrete, clothed in all the complexity with which nature has surrounded them, an endeavour to elicit a general law by a process of induction from a comparison of details; there remains no other method than the *à priori* one, or that of abstract speculation."

24. And that this is Mr. Mill's well-considered and settled opinion appears by his later work (*Logic*, vol. I., p. 414, Edit. 1856). "We have thus already come within sight of a conclusion, which the progress of the inquiry will, I think, bring before us with the clearest evidence: namely, that in the sciences which deal with phenomena, in which artificial experiments are impossible (as in the case of astronomy), or in which they have a very limited range (as in physiology, mental philosophy, and the Social Science), induction from direct experience is practised at a disadvantage, generally equivalent to impracticability, from which it follows that the methods of those sciences, in order to accomplish anything worthy of attainment, must be to a great extent, if not principally, deductive. This is already known to be the case with the first of the sciences we have mentioned, astronomy; that it is not generally recognized as true of the others, is probably one of the reasons why they are still in their infancy." Surely there is some inconsistency in this last sentence with Mr. Mill's previous assertion, that *all* the most distinguished writers on Political Economy had adopted the *à priori* method.

25. We have, however, the misfortune to be entirely of an opposite opinion to Mr. Mill on this point. We venture to affirm, that the true reason why Political Economy is in its infancy, is because Economists (at least later ones) have not sufficiently seen that it is a purely Inductive Science, and because they have not treated it in that way. On the contrary, we affirm that the true reason why Political Economy is now over-run and infested with doctrines which bear every analogy to those which infected mechanics before the days of Galileo, is because Economists have adopted the *à priori* method of arbitrary dogma-

tizing, and have never sufficiently informed themselves of the *facts* they have to deal with, and never sufficiently tested the conceptions they have formed of the objects Political Economy deals with, and the general laws they adopt, with the laborious care and rigorous accuracy that is absolutely indispensable for the establishment of true science. And we entirely dissent from Mr. Mill's views (*Logic*, vol. I., p. 526). "The Deductive Method; which, in the present state of knowledge, is destined henceforth irrevocably to predominate in the course of scientific investigation. A revolution is peaceably and progressively effecting itself in Philosophy, the reverse of that to which Bacon has attached his name. That great man changed the method of the sciences from deductive to experimental, and it is now rapidly reverting from experimental to deductive."

26. We have now got to the foundation of what we consider Mr. Mill's erroneous ideas as to the proper method of treatment of Political Economy. He contradistinguishes Political Economy from physical science, because he says it is impossible to obtain an unlimited number of artificial experiments in it, and, therefore, it is impossible to obtain its general laws, as is done in physical science. We shall endeavour to shew hereafter, that though in general it is not possible to have actual experiments, yet we can have what, to all intents and purposes, are equivalent to experiments, and which stand in exactly the same relation to Political Economy (and we might add the moral sciences in general, only that we must confine ourselves to our specific subject) as experiments do to Physics.

27. Bacon, in describing the defects of the Syllogistic or *a priori* method, which was in use in physical science in his day, saw clearly that it never could penetrate the recesses of nature. He says, (*Distributio Operis*), "The Syllogism consists of propositions, propositions of words, but words are the tokens and signs of conceptions. So that if the very conceptions of the mind (which are, as it were, the soul of words and the foundation of this superstructure and edifice) are badly and inconsiderately formed from the facts, vague, nor sufficiently definite and limited, faulty in short, in every way, it ruins everything," which he repeats almost in the same terms, *Nov. Org. Lib. I.*, Aph. 14. And he over and over again repeats that the formation of conceptions, or definitions, and axioms, or general laws, by true induction, is the only way of expelling fallacies. So, in affirming that the conceptions and axioms of his own day were utterly worthless, he says, Aph. 18, "The discoveries already made in the sciences are of such a sort as scarcely to be below the surface of the vulgar notions; but in order to penetrate to the deep recesses of nature, both conceptions and axioms must be derived from facts, by a more certain and guarded method." And Aph. 40. "The formation of conceptions and axioms, by a true induction, is assuredly the true remedy to drive away and expel fallacies. And of these fallacies, the fallacies of language, (*Idola fori*), which men gain from one another by common discourse, are the most troublesome of all. For the ill and unfit choice of words wonderfully obstructs the understanding. For words plainly exert a power over the understanding,

and throw everything into confusion, and lead men away into numberless empty controversies and phantasies; for men believe that their understanding controls their language, but it is also true that language reacts and turns back its power over the understanding, which is the very thing which has rendered philosophy and the sciences sophistical and inactive. But words are commonly framed by the capacity of the vulgar, and divide things according to the lines which are most obvious to the understanding of the vulgar. And whenever a clearer intellect and a more careful observation, wishes to shift these lines to a truer agreement with nature, words cry out against it. Thus it happens that great and important discussions of learned men often turn into controversies about words, and names, with which (according to the wise custom of mathematicians) it would be more prudent to begin, and so bring them into order by definitions." Aph. 40, 59, and so Aph. 60. "The fallacies which words impose upon the understanding are of two sorts. They are either names of things which do not exist, * * or they are names of things which do exist, but are confused and ill-defined, and hastily and irregularly formed from the facts. And this class, which is formed by a bad and unskilful abstraction, is intricate and deeply rooted." So also Aph. 105, "And the assistance of this Induction is to be used, not only in discovering general laws, but also in the formation of conceptions. And assuredly in this Induction the chief hope lies."

28. Some writers, indeed, suppose that the technical terms in Political Economy, being chiefly used in common discourse, cannot be defined with the same accuracy as those in physical science. This, however, is a complete error. A very large proportion of the technical terms in every science, at least in the older ones, are words taken from common discourse, but they are invariably fixed and defined, and uniformly used in a special sense, in that science. This is especially the case in geometry, mechanics, and theology. Hence we see that that circumstance is by no means peculiar to Political Economy. Nor is the formation of definitions an arbitrary proceeding. It is not an uncommon idea that authors may give their own definitions to words as long as they uniformly adhere to the same sense. But this, too, is a grievous error. Conceptions, or Definitions, have their foundation in nature, exactly as general laws have, and they must be settled by the same process and with the same care. There is a natural connection of objects, and this must be thoroughly understood before it is possible to settle true conceptions. Classification is founded on reality, not upon arbitrary association, and we shall never attain true knowledge until we can look through the husk of a name to nature.

29. And most men, eminent as clear thinkers, since the days of Bacon, have dwelt upon the importance of true conceptions. Thus, Hobbes says, (*Leviathan*, pt. 1, c. 4,) "In the right definition of names lies the first use of speech, which is the acquisition of science. And in wrong, or no definition, lies the first abuse, from which proceed all false and senseless tenets." And again, "Every man, who aspires to true knowledge, should examine the definitions of former authors, and either

correct them, or make them anew." Nor is Mr. Mill himself insensible to the importance of the true interpretation of names, in other things, though he strangely discourages it in Political Economy, for he thus concludes an able chapter on Definition, (*Logic*, Vol. I., p. 175), "But to penetrate to the more hidden agreement on which these obvious and superficial agreements depend, is often one of the most difficult of scientific problems. As it is among the most difficult, so it seldom fails to be among the most important. And since upon the result of this inquiry, respecting the causes of the properties of a class of things, there incidentally depends the question what shall be the meaning of a word; some of the most profound and most valuable investigations which philosophy presents to us, have been introduced by, and have offered themselves under the guise of, inquiries into the definition of a name."

30. And this is equally true of Political Economy as of any other science, and yet it has very generally been overlooked, and even denied. The whole science is founded on obtaining true conceptions of a few fundamental words, such as *Value*, *Currency*, *Capital*, *Credit*, *Production*, *Consumption*, *Measure of Value*, *Rate of Profit*, and some others. Nor do these stand by themselves, as mere isolated exercises of ingenuity. Dr. Whewell points out that true definitions are always associated with some proposition, and that it is only true conceptions, or general terms, that render general propositions possible. Nay, in fact, it is generally the discussion of propositions that gives rise to the battle of definitions. When certain writers deny, and sneer at those who think that credit is capital, it comes to this. What is Capital? and what is Credit? And so on, of most of the disputed doctrines in Political Economy, it will invariably be found that the combatants form totally different conceptions of the words they are using.

31. We have, in the foregoing remarks, endeavoured to establish the following points,—I. That Bacon declared that Physical Science was the true basis and preparation for the study of Moral and Political Science, and that his method was applicable to the latter, as well as to the former. II. That Political Economy is an Inductive Science. III. That Mr. Mill is in error when he says that *all* the most distinguished Economists have considered that the *a priori* method is the proper mode of treating it; that, on the contrary, the most distinguished have considered and treated it as an Inductive Science. IV. That the same methods of investigation are to be followed in Political Economy, as have been followed since the days of Galileo in Mechanics, that it consists of Conceptions and Axioms upon which the same labor is to be bestowed in ascertaining and settling, as is done in Physical Science, and that the settlement of these is to be governed by the same principles. V. That the acknowledged standards of reasoning in Physical Science are to be followed in Political Economy, and that if any of the prevailing doctrines, or modes of reasoning, current in Political Economy, are manifest violations of the acknowledged standards of reasoning in Physical Science, they are to be condemned and altered. We shall not, of course, in this place, enter into any attempt to settle each conception and axiom, because that is done under each article separately, to which we must refer. We shall

merely bring forward, in the following sections, a few examples of the immense consequence to the science, of adopting true conceptions of some of the principal words, and the different doctrines that necessarily follow from the settlement of such definitions.

32. With respect to the conception of the Science itself, we have shown the advantage obtained by framing such a definition of it, as shall be free from the objection which Mr. Mill has justly brought forward against the ones in common use. By treating it as the science which treats of the *Laws which regulate the Exchangeable relations of quantities*, we obviate the objections which have been justly urged against considering it as the science which treats of the *Production, Distribution, and Consumption of Wealth*. For it at once draws a sharp and distinct line between an agricultural product, and the art and science of agriculture, between any commercial product, and the art and process of producing it, and in general between any actual products, and their exchangeable relations, and the several processes by which they are obtained. Thus we have a clear and distinct test of what the pure science of Political Economy includes, and what is to be considered beyond its limits. Because whatever causes an increase or a diminution of the *number* of products, or varies their exchangeable relations, is a question of pure Political Economy, the method or process of obtaining such products is a branch of the arts or commerce. Thus the causes which induce a greater or a diminished quantity of corn to be produced, and influence its price when produced, is a question of pure Political Economy, the improved modes of cultivation are part of the art and science of agriculture. But the question of Foundling Hospitals, and the influences they exert in increasing or diminishing the number of foundlings, is a question of pure Political Economy. So ragged schools and reformatories, so long as they are considered with reference to the improvement or deterioration of the inmates of them, come under the denomination of morals, but if we consider their effects in increasing or diminishing the number of criminals, that is a question of Political Economy, and so on.

33. In the formation of conceptions it is not only necessary to obtain true ones, but also to fill them up, or to ascertain *all* the quantities that satisfy them. Thus, when we firmly fix in our minds, that the term *VALUE* in Political Economy is exclusively to be understood as a *SIGN* or *EQUALITY between two ratios*, or that, in fact, we may say that *Value is a proportion*, and not a *quality*, it follows that whatever quantity enters into this proportion, is an independent economic entity, whatever its nature be. Thus, when we say that one ounce of gold is of the value of fifteen ounces of silver, that is simply the following equation:—

1 oz. Gold = 15 oz. Silver,
which is the following proportion:—

Gold : Silver :: 15 : 1.

As soon, then, as we see that value is the sign of equality between these respective quantities, 1 oz. gold and 15 oz. silver, or that it indicates the ratio in which gold and silver will exchange, it follows that any two quantities whatever, between which this sign can be placed, are to be considered as independent entities in Political Economy, and

are within its domain. Thus, if an hour's instruction in music, or drawing, is worth a guinea, that instruction is an economic entity. Now, an hour's instruction in music, or drawing, and a loaf of bread, or a table, cannot very well be compared with each other, but when we find that persons will give the same quantity of money for a certain quantity of each of them, they do become commensurable. That is, as Aristotle most exactly pointed out, the *desire* for them, and the quantity of money any one will give for them, is the measure of their value. And it follows that each of them is an independent entity, and must be treated as such. Hence, all personal and professional services, for which men pay money, are to be considered as independent entities, for the very same cause confers value upon each of them—namely, the *desire of mankind*. If I require the Attorney-General's opinion, for which I pay fifty guineas, and I also require a chronometer watch, for which I also pay fifty guineas, it manifestly follows, that the Attorney-General's opinion is an economic entity, just as much as the chronometer watch.

34. Now, Adam Smith and Ricardo restricted their views to *material* products only, in which it is quite clear that their system is defective. J. B. Say, and the French school of Political Economy, and Mr. Senior, have seen that intellectual capital is, to all intents and purposes, an economic entity. That the copyright of a work, or the goodwill of a business, is an economic entity as much as an acre of land, or a steam-engine. Thus, they have greatly extended the boundaries of the science. But yet they have not enlarged it to its full limits. Because there is an immense amount of valuable property which they have left unnoticed, and which is yet manifestly within the domain of Political Economy. And that is, all annuities, all estates in remainder and reversion, all future payments of every description, in short. Thus, for instance, we may buy an annuity of £3 for ever for £100. Then we have the equation:—

£100 = a perpetual annuity of £3.

From which it manifestly follows, that the annuity of £3 is an independent entity, just as much as the chronometer watch, or the Attorney-General's opinion.

35. Now we shall never obtain a clear conception of Political Economy, unless we firmly adhere to this—that it is *human desire that confers value upon anything whatever*. And that whatever satisfies a human want, and for which men will give anything in exchange, is an independent entity, and that it is so only, and so long as men will give something to obtain it. When we buy a landed estate for £100,000, most persons will say that the *land* is the equivalent for the money. And so it is in a certain sense. But how is it so? The reason is that, when we give £100,000 for an estate we feel assured that the land, year by year, for ever, will produce something of the value of £3,000, that some one will give £3,000 for its products. That, in fact, it is the source from which a perpetual annuity of £3,000 will spring. Hence, we see that it is the demand for the products of the land which confers value upon it.

36. Now it manifestly follows that any source whatever from which an annual revenue springs, is also an independent economic entity. Thus,

the copyright of a work is valuable, because it is expected that a certain number of persons will come in future to exchange something for so many copies of the work. So the goodwill of a business is a valuable thing, because it is expected that so many persons will come to buy at that shop. Also a knowledge of law is a valuable thing, because it is calculated that a certain number of persons will have the misfortune to require some legal products, and so on of the other professions. The same cause confers value on each of them, the same cause would deprive them of value—namely, a cessation of the demand for their products. Now these considerations strike at the very root of some of the prevalent doctrines of Political Economy—because it is a very common opinion that it is *labour that confers value*. Whereas we see that it is *demand* exclusively that confers value. A highly cultivated piece of land in the centre of Australia, after satisfying the wants of the few persons who were necessary to till it, would have no more *value* than any other portion of waste land round it, because there would be no demand for its products. Hence we see that a landed estate, the copyright of a work, the goodwill of a business, a professional education, are each of them independent entities, and must always be so treated in Political Economy.

37. But it follows too, in fact, it is only another term for the goodwill of a business, that each man's skill, industry, judgment, and mercantile connection, is an Economic entity, over and above his actual money and commodities, and is measurable in money; and he can dispose and sell the *FUTURE* produce of his commercial skill, just as much as he can of his existing property; and this in mercantile language is called *CREDIT*. And this property is daily bought and sold to the amount of millions of money, by means of instruments of credit, which in commercial language are called Bills of Exchange, and these Bills of Exchange do not *represent* any money or commodities whatever; they represent the *future* produce of his skill and industry; and they are independent entities, wholly distinct from money and commodities.

38. Now we shall see the application of Dr. Whewell's remark, that true definitions are always connected with propositions. For, when we consider that the term value is the sign of equality between two independent Economic entities (*VALUE*), and when we thoroughly understand that instruments of credit are independent Economic entities, and not mere tickets on commodities, like Bills of Exchange and Dock Warrants (*CREDIT*); and when we further understand that Capital is a particular method of using an Economic entity (*CAPITAL*); that is, that whether an Economic entity is to be considered as Capital, does not depend upon the *nature* of the thing itself, but upon the *method* in which it is used; and when we further consider that instruments of Credit are independent Economic entities, which may be used in the manner by which entities become Capital, we arrive at this great proposition, THAT *CREDIT IS CAPITAL*.

39. And how is this great proposition arrived at? By forming true conceptions of the words *Value*, *Credit*, and *Capital*. But, in order to form a true conception, a particular method of statement of the circumstances is indispensable.

Any one who knows anything of Political Economy, must be aware of the perpetual sneers and ridicule a long series of writers have poured out upon the doctrine that credit is capital, and the taunts which they threw at those persons who think that it is, saying that they believe that the same thing can be in two places at once. But then when we come to examine what the ideas of these writers are upon the nature of credit, we find that they have most plainly misconceived it. Because they state the question thus. That if B holds A's bill payable (say) three months hence, that if it is a credit of B's it is a debt of A's, and therefore the two balance, and the result is *nil*. And they manifestly treat it as if it were a diminution of A's *existing* property, and consider it as an existing debt of A. Now this is an entire misconception of the nature of the case. A merchant who has given his bill, payable three months after date, is *not in debt at all* until the bill falls due. He is no more in debt than a farmer is in debt for his *next* year's rent. It is utterly bad law to suppose that a merchant who gives his bill, payable three months hence, is in debt. To say that it is a diminution of his property is a highly ambiguous expression, because it *is* true, but it is *not* true in the sense commonly attached to it. It is no diminution of his actual property, but it is a diminution of the products of his *future* industry. The fact is, that the *future* produce of A's industry is an independent entity, and he has sold that to B just the same way as he might sell a horse; but that does not annihilate the existence of the horse as an independent entity. So it is perfectly true that A may sell the future produce of his industry to B, but that does not annihilate the existence of that future produce.

40. Bacon (*Nov. Org. Lib. I. Aph. 55*) says that there is a great and almost radical distinction between minds in regard to philosophy and science, that some are more apt to perceive the difference of things, and others the resemblances. This distinction, though often insisted upon as fundamental, will appear to be less radical, perhaps, if we consider that to do each accurately, depends upon the same general power, namely, that of separating complex terms into their elementary ideas, and discerning which is the leading idea, and which are the subordinate ones. When the leading ideas of objects are identical, they must be classed together, even though some of the subordinate ones are opposite. On the other hand, when the leading ideas are opposed, then there is a fundamental distinction between the objects, even though some of the subordinate ones are similar. Thus the same general power of the mind enables us to annihilate spurious identities, and to detect latent similarities. Now all true classification, which is as much as to say all true science, is based upon perceiving fundamental analogies beneath superficial differences, and fundamental distinctions, beneath superficial resemblances.

Now one of the fundamental conceptions in Political Economy is, that money, bank notes, bills of exchange, notwithstanding their superficial difference, are fundamentally analogous. And that bills of exchange, bills of lading, dock warrants, &c., though having some superficial resemblances, are fundamentally distinct. Now common persons, looking only at the superficial difference

between bills of exchange and money, seeing that one is credit and the other payment, and that a bill of exchange promises to pay money on the face of it, think that they are totally distinct, whereas a real knowledge shews that they are each separate entities, and that money is only the highest form of credit, it is in its nature only a universal bill of exchange. On the other hand, common persons looking only at the superficial resemblances between bills of exchange and bills of lading, and supposing that one represents so many sovereigns, and the other so many casks of tallow, and that they are both negotiable instruments, jump at the conclusion that they are identical in their nature. Whereas, real knowledge of the subject shews that they are wholly distinct, the former being independent entities, and the latter merely tickets on goods.

41. And here we have one of those striking results which are invariably found to attend the settlement of some true conception or principle. For a clear understanding of this point strikes at the root of that stupendous fallacy, John Law's theory of currency, which has been an insoluble enigma to Political Economy from that day to this; for it is entirely founded on confounding the distinction between bills of exchange and bills of lading, and supposing that any paper currency, which only represents some article of value, will maintain its value with respect to gold and silver. And innumerable projectors at the present day believe in it; nay, we constantly find some person starting up and announcing it as some great new discovery, whereas it has been tried over and over again and uniformly failed. A true conception of this point lays the axe at the root of all the theories of basing a paper currency upon land, the public funds, or commodities, because it shews us that money and instruments of credit perform a certain peculiar function in Economy, which is wholly distinct from that performed by commodities. Thus we see that one great practical good obtained from the settlement of a true conception is, that it instantly detects and exposes a most dangerous and fallacious theory, which has often been tried and uniformly failed.

42. Thus we see that the attainment of true conceptions is not a mere matter of logomachy, but one of enormous practical importance. For the policy of nations has often been guided by the assumed meaning of an expression. Thus the expression the *balance of trade* misguided and misled the most sagacious ministers and statesmen, for a very long time, into a most mischievous course of legislation, until at last some clear sighted Political Economists began to examine into the meaning of the phrase, and then it was found to be the most palpable delusion, the veriest chimera, and most transparent sophism that ever deceived mankind, even in Political Economy, which is saying a great deal. Thus, too, the disputed points in the theory of the Income Tax as to a difference in rating incomes from professions and property, can only be settled by a true conception of the nature of capital.

43. We shall only select one more instance of the erroneous doctrines which spring from an inaccurate definition. It is a principle of Ricardo's, which has been adopted by his followers, that the *rate of profit* is solely influenced by the rate of wages, that profits rise when wages

fall, and profits fall when wages rise. A very slight knowledge of commerce shows that this doctrine is a pure delusion. Practical experience shews that profits are often highest when wages are high, and when profits are low, wages are low too. And when we examine the matter, we find that the false doctrine springs entirely from a false definition. Because Political Economists have failed to see that the *rate of profit* must be reduced to the same standard as the *rate of interest*. Adam Smith uses the expressions *rate of interest* and *rate of profit* without seeing that both rates must be reduced to the same standard. When a man borrows £100 and pays £5 for the use of it, we always refer that to the standard of the year. Whereas the term *rate of profit* is used by Political Economists, to mean simply the ratio of the profit to the cost of production without reference to the time. But this is a most manifest error, and the whole of Ricardo's chapter on profits is based upon this manifest fallacy. The error is in confounding the *actual profit* with the *rate of profit*. Now it may easily happen, that the rate of profit is the greatest, when the actual profit is the least, and the contrary. Thus, if a man makes 50 per cent. by one transaction, that is a high profit, but if he only effects one transaction in the year, that would not be a great *rate of profit*. But if he made a profit of only 5 per cent., that would not be a high actual profit, but if he made it in one day, it would be at the rate of upwards of 1,700 per cent. per annum. Now, these considerations, which are manifestly true, entirely overthrow a very large portion of the current doctrines upon wages and profits.

44. We must content ourselves with these examples, which, we think, are sufficient to establish the point we are anxious to enforce—namely, the immense practical importance of accurate definitions. There is, however, one further point we must notice; that when we have once accurately obtained and settled true conceptions, we must carefully avoid using expressions which are inconsistent with them, and if we find that such expressions are in common use, we must do our best to extirpate such noxious words from the science. Thus, when we thoroughly understand the conception that value is the sign of equality between two independent quantities, or is a proportion, we instantly see that such expressions as *representative of value*, and *intrinsic value*, are absolute nonsense. To speak of the *representative of value* is as manifestly erroneous as to speak of the representative of a proportion; *intrinsic value* is as unintelligible jargon as to speak of an *intrinsic proportion*, or an *intrinsic relation*. It is absolutely necessary, therefore, to banish such expressions from the science, and all expressions liable to a similar objection. That this is a matter of very great difficulty is extremely true, but the science never will be brought to a satisfactory state until it is done, and if it is never begun, it will never be done.

45. Fully sensible as we are of the extreme imperfection of the foregoing remarks, we must now leave this part of our subject. The contradictory views of different Economists will be brought together under each term separately, and some of the consequences that result from them explained. We may, too, refer our readers to the Appendix to Archbishop Whately's *Elements of*

Logic, where, under the head of Ambiguous Terms, several of the contradictory opinions of writers are brought into contrast. Among them is the term *Wealth*, and we will conclude this part of the subject with some remarks of his. "It were well if the ambiguities of this word had done no more than puzzle philosophers. One of them gave birth to the mercantile system * * * The results have been fraud, punishment, and poverty at home, and discord and war without * * * *It has for centuries done more, and perhaps for centuries to come will do more, to retard the improvement of Europe, than all other causes together.*"

On the Formation of Axioms.

46. "Definition and Proposition," says Dr. Whewell, "are the two handles of the instrument by which we apprehend truth." We must now make some observations as to the method by which the Axioms of Political Economy are to be settled. But the word Axiom itself has been a subject of much controversy; for some restrict it exclusively to mean a *self-evident* truth. We cannot prolong this article by entering upon this discussion. It is sufficient to say that we use the word in the general sense of a fundamental principle, which is used as the foundation of a science, or a general system of reasoning. In such a science as geometry, the Axioms are from the necessity of the case, self-evident. But in the physical sciences they are not so. On the contrary, it is the very object of the Inductive Philosophy to discover them. The name of Axiom is given by Bacon and Newton to those great general principles which are decided to be true by Induction, such as the laws of motion. And to this sense of the word we adhere. Now, as we have defined Political Economy as the science which investigates the laws which regulate the exchangeable relations of quantities, it is evident that our next object is to endeavour to discover some general laws, or expressions, which explain the phenomena in Political Economy, with the same generality as the laws of motion do the phenomena of motion.

47. And it is in the mode of deciding which is the true one among any number of proposed laws, that the whole nature and character of the science consists. In physical science it is generally possible to devise any number of arbitrary experiments, from which it is possible to decide in favor of any law, out of any number that may be proposed, by the laws of Inductive Logic, whence Inductive Science is frequently called Experimental Science, and the two names are used as almost synonymous; and we have seen that the reason why Mr. Mill has denied that Political Economy is an inductive science, is because it is not possible to have an unlimited number of arbitrary experiments in it. From which he falls back upon the *à priori* or dogmatic method, or we may call it both the ante- and the anti-Baconian method.

48. Bacon, however, has declared that the moral and political sciences, among which of course is included Political Economy, are purely inductive sciences, and are to be constructed by exactly the same method; and, in our opinion, Bacon is right. It is perfectly true that, in Political Economy, it is not generally possible to make experiments, except by those who are at

the head of affairs. We may, therefore, at once admit that a solitary inquirer has not the power of making an unlimited number of arbitrary experiments, and that we can only watch, by direct observation, those performed by the State. But in Political Economy—and in the Moral Sciences generally—we can have what are in all respects equivalent to experiments—namely, FEIGNED CASES. It is perfectly well known, that when the application of a legal principle is doubtful, it is customary to *feign a case*, for the purpose of clearing up doubtful points, and the same is true of the Moral Sciences generally; and we can argue from feigned cases, and deduce principles from them, with exactly the same degree of certainty as if they were real cases, and also with the same degree of certainty as principles are tested by real experiments in experimental science.

49. But there is one point which must be particularly attended to in such a mode of argument, drawn from the very analogy of experiments. *The feigned cases devised for the purpose of eliciting principles must be possible.* An experiment from its very nature is a possible combination of circumstances. Now, in Political Economy no true principle can be deduced from an impossible case. It is not possible to predicate any result at all in such a case. Nor is this palatable truth of small importance. Writers who have adopted the *a priori* method have often argued from feigned cases, but they have not always observed this rule. We will only cite one conspicuous instance of the violation of this principle. In some attempts that have been made to shew that an increase of the currency can have no effect in increasing the production of wealth, but would only raise the price of existing commodities, it is sometimes argued in this manner:—"Suppose," it is said, "people were to awake some morning and find all their money doubled in quantity, what would be the effect? Simply that the prices of all commodities would be doubled." But the answer to this mode of arguing is, that it is an impossible case, and no principle can be deduced from such a case. It is not possible that such a thing should happen, and all results attempted to be deduced from such an example must be discarded as futile. If we would deduce principles of any worth from a supposed case of the doubling of the quantity of the currency, we must strictly follow the method in which it would *really* take place.

50. And it is just in this very thing that the genius of the Platonic Philosophy consists. It is essentially Inductive. Only Plato applied the Inductive method to the ideas of the moral world, Bacon to the ideas of the physical world. That Plato was not always successful any more than Bacon, is true. But the genius of the philosophy of each was identical. But the immense and the undivided merit of Bacon was, that he saw and declared that Physical Inductive Science must *PRECED* Moral Inductive Science. That Natural Science was the nursing mother of all science, that in it are to be found the types and standards of reasoning, to which all other reasoning is to be referred, that it is the *παιδαγωγός* to lead us to the study of Moral Science. And we insist upon this the more strongly, because it has been most strangely overlooked and denied. We have seen

by the extract we have given above from J. B. Say, his extraordinary assertion that Bacon was completely ignorant of the connection between the two! And others, too, have fallen into a similar error, and that it is a most grievous error, we have proved by extracts from Bacon himself. Hence, we see that there are two great divisions of Inductive Science, the one Physical, and the other Moral, both absolutely identical in their genius, both to be followed and cultivated by the same method. Now, Physical Science often receives a name from the character of the method by which its general laws, or Axioms, are proved, that is, by observation and *experiment*, and from this it is often called EXPERIMENTAL PHILOSOPHY. Now, it seems to be of some advantage to have a name for that great division of Inductive Science, whose Axioms are tested by observation and *feigned cases*, and the name of EXPERIMENTAL PHILOSOPHY seems not inappropriate. Hence, we have Inductive Science divided into two great provinces, Physical and Moral, which may be respectively named Experimental and Experiential Philosophy, and then we have this principle, that POSSIBLE FEIGNED CASES are to EXPERIMENTAL Science, what EXPERIMENTS are to EXPERIMENTAL Science.

51. As soon as we admit this, it follows that the whole of that great body of Inductive Logic, the foundations of which were laid by Bacon, and which has been subsequently extended and added to by other writers since his time, for the purpose of testing Axioms or general principles, by due experiments, is applicable to test the principles of Experiential Science by properly devised feigned cases.

52. There is, however, a point of difference to be noted. In Experimental Science we can always predict that the result will be true in each particular instance. In Experiential Science, it is only possible to say that such and such results will take place, but it is not possible to say that any given individual will do them. The properties in the physical world are absolutely uniform, and every individual is constrained by the Supreme Artificer to obey them. We know that every individual magnet will attract every individual needle. But, though we know that in Political Economy, wherever a profit is notoriously to be made, *somebody* will make it, yet we cannot say what individual will do it. Thus, if the rate of discount were 6 per cent. at Paris, and 4 per cent. in London, we know that it would be profitable to fabricate Bills of Exchange for the purpose of exporting bullion from London to Paris, and we can infallibly say that it will be done, though we cannot say that this or that merchant will do it. And thus, knowing that it will infallibly be done by some one, we are enabled to form the general principle, that the rates of discount between the two places must be brought within a certain degree of equality to stop the flow of bullion from one place to the other. Now, this general principle is just as true and certain as the law of gravitation, and it gives us a true and certain law to guide us under certain circumstances, and it gives a final and conclusive answer to all economists who think that the rate of discount can be kept uniform in this country, without reference to the current rates in other countries.

53. Having then gained this solid foundation, that possible feigned cases are in every respect analogous to experiments, that they may be devised with the same unlimited variety, and that that great body of well settled and impregnable Inductive Logic, built up and matured by the care and sagacity of Bacon and other eminent men, is to be applied to test the Axioms of Experimental Science, we shall now proceed to see whether it is possible to establish Axioms regarding the exchangeable relations of quantities, exactly analogous to the laws of mechanics, and which shall be proved to be true by the very same standards of reasoning, and we shall also test the doctrines of some writers of great influence in Political Economy, by the same standard.

54. And first of all let us observe Bacon's precepts regarding the formation of Axioms in Physical Science. In these we have only to substitute "feigned cases" for "experiments" throughout, and we shall obtain an Inductive Logic for Experimental Philosophy. He says, *Distributio Operis*, "Those who aspire to discover and to know, and not to guess or divine, not to devise mimic and fabulous worlds of their own, but to penetrate and dissect nature herself, must seek everything from the facts themselves. Nor can any genius, or thinking, or argument, sufficiently supply the place of this labour, search, and world-wide perambulation; no, not if all men's wits could meet in one." That an entire reconstruction of science was necessary, of which the foundation must be laid in a description of nature, which was not to be turned at first so much to actual fruition, as to throw light on the discovery of causes, and to supply the infant science with the first nourishment. "For though we are chiefly in pursuit of the practical and active part of science, we must wait for the time of the harvest, and not reap the moss, or the green corn. For we well know that general principles once rightly discovered, will carry whole troops of works along with them, and will produce effects, not in single instances, but in multitudes." And in *Nov. Org. Lib. I., Aph. 70*, in enforcing the necessity of carefully devised experiments, (or feigned cases,) and the care and attention necessary to contrive a variety of them, and to extend the inquiry generally, "For no one successfully investigates the nature of a thing in the thing itself." And he advises us to imitate the divine wisdom, which in the first day created light only. So we must endeavour to gather from all sorts of experience, and to discover true causes, and general principles, and to devise "*experimenta lucifera*" for this purpose, or instances contrived with the express view of testing general principles, before we go to practice. Let us now, then, endeavour to apply the preceding principles to the ascertainment of the Axioms of Political Economy. That is, let us apply the well-known and settled laws of Inductive Logic to decide which of several proposed Axioms are to be admitted as true.

55. There is one law of Inductive Logic, which has been discovered and settled since Bacon's time, which we shall find to be of supreme importance in governing our decision. It is the *Law of Continuity*. "The Law of Continuity," says Dr. Whewell, (*Phil. Ind. Sci., Vol. II., p. 413*), "consists in this proposition:—*That a*

quantity cannot pass from one amount to another, by any change of conditions, without passing through all intermediate degrees of magnitude, according to the intermediate conditions. And this law may often be employed to correct inaccurate inductions, and to reject distinctions which have no real foundation in nature. For example, the Aristotelians made a distinction between motions according to nature, as that of a body falling vertically downwards, and motions contrary to nature, as that of a body moving along a horizontal plane; the former they held became naturally quicker and quicker, the latter naturally slower and slower. But to this it might be replied, that a horizontal line may pass, by gradual motion through various inclined positions, to a vertical position, and thus the retarded motion may pass into the accelerated, and hence there must be some inclined plane on which the motion downwards is naturally uniform; which is false, and therefore the distinction of such kinds of motion is unfounded." That is to say, there is no point whatever at which the one kind of motion passes into the other. And again, p. 415:—"The evidence of the Law of Continuity resides in the universality of those ideas which enter into our apprehension of the laws of nature. *When of two quantities, one depends upon the other, the Law of Continuity necessarily governs this dependence.* Every philosopher has the power of applying this law, in proportion as he has the faculty of apprehending the ideas which he employs in his induction, with the same clearness and steadiness which belong to the fundamental ideas of quantity, space, and number. To those who possess this faculty, the Law is a *Rule of very wide and decisive application*. Its use, as has appeared in the above examples, is seen rather in the disproof of erroneous views, and in the correction of false propositions, than in the invention of new truths. *It is a test of truth, rather than an instrument of discovery.*" Which, we may observe, is the true function of all Logic, both Aristotelian and Baconian,—formal and inductive.

56. Now let us apply the principles we have endeavoured to establish regarding possible feigned cases, and the law of continuity, to the verification of an axiom regarding the general law of price in Political Economy. We have (*Elements of Political Economy; and PRICES, THEORY OF*) devised two possible feigned cases of the *extremes* of price. We have shewn that when it is extremely low it depends upon what is commonly called, the law of *supply and demand*, and we have shewn that when it is extremely high it also depends upon the same law of *supply and demand*. We have shewn that no other law whatever, but that of supply and demand, operates at the extreme points of price; hence, we affirm, by virtue of the *Law of Continuity*, that the same law of demand and supply, universally, solely, and exclusively, regulates price at all intermediate points, in all cases whatever, and at all times.

57. By virtue, therefore, of the preceding considerations, we take our stand in this impregnable position. We affirm that this induction is as conclusive as any in existence, and that no criticism, or cavils, or objections, can shake it more than the ripple of the summer sea can wash away Ailesa Craig. Standing on this solid foundation, we can affirm that if any other law whatever be proposed

as regulating price, at any intermediate point between the extremes, other than *demand and supply*, it *must* be unsound; and if any one be proposed which does, *apparently*, in some instances influence price, we may affirm that it will be found to be only a particular case of the general law, and that genuine Inductive Logic will prove that it is not the true law.

58. It is well known that a different law from supply and demand has been proposed by a writer, who, it is undeniable, has exercised an influence over opinion in this country, only second to Adam Smith himself—Ricardo; and we must now bring the law he has proposed, and which has been very widely received, to the test of Inductive Logic. Ricardo's Law is, that *cost of production regulates value*.

59. Ricardo, page 2 of his celebrated work, says, "There are some commodities, the value of which is determined by their scarcity alone. No labor can increase the quantity of such goods, and, therefore, their value cannot be lowered by an increased supply. Some rare statues and pictures, scarce books and coins, wines of a peculiar quality, which can be made only from grapes grown on a particular soil, of which there is a very limited quantity, are all of this description. Their value is wholly independent of the quantity of labor originally necessary to produce them, and varies with the varying wealth and inclinations of those who are desirous to possess them.

"These commodities, however, form a very small part of the mass of commodities daily exchanged in the market. By far the greatest part of those goods which are the objects of desire, are procured by labor; and they may be multiplied, not in one country alone, but in many, almost without any assignable limits, if we are disposed to bestow the labor necessary to obtain them.

"In speaking then of commodities, of their exchangeable value, and of the laws which regulate their relative prices, we mean always such commodities only as can be increased in quantity by the exertion of human industry, and on the production of which competition operates without restraint."

60. Now, we object, *in limine*, to this method of conducting the inquiry. To tear and dis sever a small portion of the phenomena from the entire body, is to violate the very first principles of Inductive Science. Designedly and systematically to exclude all phenomena from the investigation, which do not square with some theory, and to lay down a law which is applicable to them only, and in direct opposition to the laws which regulate other phenomena, is at variance with all modern science. If Ricardo had wished to consider only a particular class of phenomena, the true way would have been to take the general law, and shew the particular circumstances that modified it in that class of cases. But Ricardo has done exactly what an Astronomer would do if he were systematically to exclude from investigation all phenomena but those which agreed with the Ptolemaic system, and propounded a set of laws which only *apparently* explained these phenomena, and were directly opposed to the laws of all other celestial phenomena. He has specifically excluded from consideration all but a certain class of phenomena, and for the explanation of these he pro-

poses a law, which is not the general law modified to suit that one class of cases, but which is in direct opposition to the laws which regulate all other phenomena.

61. Now, we say that this general statement of his mode of inquiry is sufficient to insure its condemnation by any one acquainted with modern science; even before we come to examine particular objections to it, or shew what specific principles it violates. In the first place, we must say, that the proportion of economic quantities which are beyond the pale of the Ricardian law is very much greater than he is disposed to allow. But we shall shew that even in the class of cases he does consider his law is not the true one, but they are particular cases of the general law.

62. In the first place, we must observe this as an essential property of any general expression, *that it must exhibit on the face of it all the elements which influence its action*. Now, it is perfectly undoubted that *quality* is one element that influences value. But what trace of it appears on the face of the law that *cost of production regulates value*? This, then, is one essential particular in which the Ricardian law is manifestly defective.

63. Let us now call to mind a few of the Baconian precepts regarding the formation of Axioms, which are undoubted portions of Inductive Logic. He says, *Nov. Org. Lib. I., Aph. 46*. "The human understanding, when it has once adopted an opinion, (either because it is the received opinion, and believed, or because it pleases it,) draws all things else to support and agree with it; and although there be a greater number and weight of instances opposed to it, yet it either takes no notice of and despises these, or else by some distinction sets these aside and rejects them, and so prejudging the matter to a great and pernicious extent, so that the authority of its former conclusions may remain untouched." A very picture, surely, of the Ricardian mode of inquiry! He then says, "This mischief insinuates itself with great subtlety into philosophy and the sciences, in which an opinion, once taken up, colours and reduces to agreement with itself, all others, even though they are far stronger and better. But even passing over that vanity and pleasure I have spoken of, it is still the peculiar and constant error of the human mind to be more moved and influenced by affirmative than by negative cases; whereas it ought to hold itself entirely impartial to each; nay even, in the formation of a true axiom, the *negative instance is the more forcible of the two*." So also *Parasceve IV.*, "For that fashion of taking few things into account, and deciding with reference to a few things only, has been the ruin of everything."

64. In this place we cannot of course repeat the instances we have given elsewhere, and to these we refer (*PRICES, THEORY OF*); we can only state the conclusions. We have shewn, then, by the instance of two strata of coals, that commodities may be produced under precisely the same circumstances in all respects of cost of production, and differ only in *quality*, and the value will be extremely different. And this is a *negative* instance of decisive authority and weight. By all the laws of Inductive Science, this single instance is fatal to the Ricardian Law.

65. But besides this we have shewn by a series of examples, partly drawn from actual observa-

tion, and partly from feigned cases, that no change in cost of production can produce any change in value unless accompanied by a change in the state of supply and demand. We have also shewn that a change in the state of supply and demand produces a change in value without any change in the cost of production, which decisively proves that *cost of production is not the regulator of value*.

66. Moreover, the object of science being to discover the laws which produce effects, if we discover the true law, then we know how to produce any required effect. And here Bacon's third Aphorism applies:—"Science and human power agree in this, that ignorance of the cause prevents any required effect being produced. For nature is not to be governed except by obeying her; and that which in Theory is the cause, in Practice is the rule." Now, from this Aphorism it follows, that if the law that cost of production regulates value is theoretically true, if we wish practically to influence value, we must act upon the cost of production. That is to say, if we choose to increase the cost of production, we can thereby increase the value, a consequence which every sensible man knows to be utterly absurd. And this is the very practical error upon which a large proportion of those unhappy proceedings, named strikes, have been founded. It is perfectly certain that many of them have been brought about by the persuasion of the workmen, that if their masters paid them higher wages, they could compel the public to pay higher prices. A most miserable delusion, which has brought thousands and thousands of honest and hardworking, but deluded, men and their families to ruin. Yet it is the logical consequence of such doctrines of Political Economy. But we know perfectly well that if we act upon the relation of supply and demand any effect in value may be produced, which proves that the latter is the true rule.

67. We have also shewn that, taking the two quantities *Cost of Production* and *Value*, as apparently regulating each other, it is just as often value that apparently regulates cost of production, as the reverse, because when the price of a manufactured article rises, wages often rise too, when the price falls wages fall too. Hence, even adopting the Ricardian phraseology, it is just as often value that regulates cost of production as the reverse.

68. But the real fact is, that price, or value, and cost of production are wholly independent of each other, and each of them depends entirely upon the law of supply and demand. The difference between these two quantities is the *Profit*, and when these two quantities cross each other, it is *over-production*.

69. We have also shewn, that in many cases, probably even in most, a diminution in the cost of production is followed by a diminution in price; but, in such cases, the diminished cost of production is invariably accompanied by an increase of quantity, and that no diminished cost of production without an increase of quantity, would produce such an effect. Hence, the increase of the quantity is the real cause of the change of value.

70. A consideration of the examples adduced leads us to the following conclusions:—

1. No change in the cost of production will

cause a change in value, unless it is accompanied by a change in the relation of supply and demand.

2. A diminution in the cost of production, when effected without an increase of the quantity produced, goes entirely to the benefit of the producer.

3. A diminution in the cost of production, in cases where the quantity of the produce can be increased without limit, goes entirely to the benefit of the consumer.

4. A diminution in the cost of production in cases where the quantity can be increased, but not without limit, goes partly to the benefit of the producer, and partly to the benefit of the consumer, and this benefit is divided between the two, in the inverse proportion of the extra quantity added, compared to the previously existing consumption.

71. It is sometimes, however, considered pedantic to attempt to attain modes of expression of scientific accuracy in Political Economy. But, if such views had prevailed in Physical Science, where would it have been at the present day? That the Ricardian law is *apparently* true in the majority of cases, is undoubtedly true. But this is just one of the tests of a scientific mode of treatment. It is exactly parallel to the case of the first law of motion, and those who adhere to the modern opinion on the subject, in preference to the old one, are bound in consistency to adopt the law of supply and demand, in all cases, rather than that of cost of production. It is exactly in deciding upon the rival pretensions of these two proposed laws, that the function of Inductive Logic consists. It is perfectly indisputable in Experimental Science, that if two laws were proposed to explain any given class of phenomena, one of which explained all the phenomena of every description without exception, and the other explained only, apparently at least, that single class, and was directly opposed to the general law, in such a case the law which only explained one class of cases, would be unhesitatingly rejected. So we may consider this as a true law in Political Economy. *That, if two or more forms of expression will explain or account for any class of phenomena regarding price, or the change of price, that form of expression only is to be held as the true one, which explains ALL the phenomena in the science, and not that single class of cases only.* And this law shews that the Ricardian Axiom is to be rejected as an expression of scientific truth. And if it is retained at all, it must be clearly understood that it is a mere popular form of expression, as we speak of the sun *setting* in popular language, knowing at the time that it is not true scientifically. Or perhaps it would be better to modify it in some such way as this,—*If the cost of production of an article is increased or diminished, a corresponding change in its value generally follows.*

72. The only way to construct a true scientific Axiom regarding price, or value, is to consider all the causes that can affect it. There are a certain set of causes which tend to elevate it, and a certain set which tend to depress it. Price, then, will vary, *directly* as the causes which tend to elevate it, and *inversely* as those which tend to depress it. And the reason why the law of *supply and demand* is the true one, is, that it can be shewn that it includes all these causes.

73. We have observed in the extracts given from Mr. Mill, that he considers as one reason of adopting the *a priori* method of reasoning in Political Economy, the difficulty of obtaining *experimenta crucis*. We think that he has greatly overestimated this difficulty, because it is quite as easy to devise feigned cases to answer the purpose, as experiments. But we have no need even of this; matters of pure observation will furnish us with decisive instances of *crucial* cases. The example of strata of different qualities of coal in the same mine, where the different products obtained under precisely the same circumstances of cost of production, bear different values on account of their different qualities, is a very strong and decisive *crucial* case. But Ricardo himself has furnished us with one which is absolutely decisive of the merits of his system. In speaking of the relative value of gold and silver, he maintains, as he was in consistency bound to do, that their relative value depends solely upon the labor necessary to produce them. He says, (*Principles of Political Economy, &c., 3rd Edit., p. 421*): "Gold and silver, like all other commodities, are valuable only in proportion to the quantity of labor necessary to produce them, and bring them to market. Gold is about fifteen times dearer than silver, not because there is a greater demand for it, *nor because the supply of silver is fifteen times greater than that of gold, but solely because fifteen times the quantity of labor is necessary to procure a given quantity of it.*" Now, it is not possible to have a more complete example of a *crucial instance* than this very case selected by Ricardo himself. Because it is entirely at variance with known facts. Such an assertion, as that it is fifteen times more expensive to obtain gold than silver, is absolutely inconsistent with well ascertained knowledge on the subject. Moreover, it is well ascertained that the supply of silver (before the discoveries in California and Australia) was not *fifteen* times, but *forty* times as great as that of gold. The reason why silver, which was forty times as abundant as gold, was only fifteen times less valuable, we have shewn to be exactly the same as makes small farms more valuable, comparatively speaking, than large ones, and small houses than large ones. Thus, the Ricardian theory is directly at variance with indisputable facts, and this case is sufficient to shew the fallacy of his system.

73. Moreover, the Ricardian law is a direct contravention of the *Law of Continuity*. He says, p. 460:—"It is the cost of production which must ultimately regulate the price of commodities, and *not*, as has been often said, the proportion between the supply and demand. The proportion between supply and demand may indeed for a time affect the market value of a commodity, until it is supplied in greater or less abundance, according as the demand may have increased or diminished; but this effect will be only of temporary duration." That is to say, Ricardo maintains that quantity in changing its price depends at one point on one law, and at another point, on a totally different law. A flagrant breach of the *law of continuity*. He then says:—"The opinion that the price of commodities depends solely on the proportion of supply to demand, or demand to supply, has become almost an Axiom in Political Economy, and has been the source of much

error in that science." He then criticises the doctrines of Lord Lauderdale, which are beyond all doubt the true ones. He says:—"Commodities which are monopolized either by an individual, or by a company, vary according to the law which Lord Lauderdale has laid down; they fall in proportion as the sellers augment the quantity, and rise in proportion to the eagerness of the buyers to purchase them; their price has no necessary connexion with their natural value; but the prices of commodities, which are subject to competition, and whose quantity may be increased in any moderate degree, will ultimately depend—*not on the state of demand and supply*, but on the increased or diminished cost of their production." Thus, we see that Ricardo again declares that, at every other point but one, in the range of prices, the law of demand and supply holds good, but that at *one* point it is *not* demand and supply, but cost of production. Which is the identical error which Dr. Whewell quotes as having been committed by the Aristotelians.

74. Equally objectionable are the views of Mr. Mill, who in many respects is a disciple of Ricardo. He says, (*Principles of Political Economy, &c., Vol. I., p. 556*), "It is, therefore, strictly correct to say that the value of things which can be increased in quantity at pleasure, does *not* depend (except accidentally and during the time necessary for production to adjust itself,) upon demand and supply; on the contrary, demand and supply depend on it." Also he says, "To recapitulate; demand and supply govern the value of all things which cannot be indefinitely increased; except that even for them, when produced by industry, there is a minimum value determined by the cost of production. But in all things which admit of indefinite multiplication, demand and supply only determine perturbations of value during a period which cannot exceed the length of time necessary for altering the supply." So also, *Vol. II., p. 10*, "Money is a commodity, and its value is determined like that of other commodities, temporarily by demand and supply, permanently, and on the average, by cost of production." It is quite clear that these doctrines involve exactly the same breach of the law of continuity as the extracts we have given from Ricardo. Nay, Mr. Mill himself had warning to reconsider this law of cost of production, because in speaking of the value of certain products, he says, *Vol. II., p. 107*, "Since cost of production here fails us, we must revert to a law of value *ANTERIOR* to cost of production, and *MORE FUNDAMENTAL, the law of supply and demand.*" Here is the very principle admitted that we have been contending for, that the law of supply and demand is the great fundamental law which underlies all cases of value. When Mr. Mill admits that the law of cost of production fails in the instances he alludes to, he should have seen that it fails in *all* cases. The causes or elements which influence value must be the same in all cases, though the potency of each element may vary. By the law of continuity, the true principles which govern value in the case of one commodity, must govern the value of *all* commodities, and the causes which influence it at one point of value must be the same which influence it at *all* points. Now, if Mr. Ricardo and Mr. Mill had laid down that, in a particular class of cases, certain circumstances act upon the relation of supply and

demand so as to produce certain effects on value, they would have been perfectly right, there would have been no breach of the law of continuity. They would have shewn that in that class of cases the general law was modified in a particular way; but what they have done is this, in this class of cases they have extruded the general law altogether; they maintain that it does not apply at all, but that a different law altogether governs these cases. But against this all modern science rebels; it is a complete rupture of the law of continuity, not only in Political Economy itself, but it is a breach of continuity between Political Economy and all the Physical Sciences, because such a mode of argument would not be permitted in any one of them.

75. Now, the real facts are these. Profit is the object of all production. If production can be indefinitely increased, and extraordinary profits are to be made, an increase of production takes place, and by increasing the supply faster than the demand, lowers the value; if production is already so great that the value is below the cost of production, production ceases, the supply is diminished until the value is raised, by and through the limitation of supply, to exceed the cost of production, and afford usual profits. But all these changes take place by acting upon supply and demand, and only by that means. So that it appears that in such cases, traders adjust the supply to the demand, so as to afford usual profits. Thus the authority of the universal and fundamental law is fully preserved, the law of continuity is maintained, and the phenomena of that class of cases are truly accounted for, and shewn only to be particular cases of the general law, and we have the whole subject summed up in these two laws:—

1. THE RELATION BETWEEN SUPPLY AND DEMAND IS UNIVERSALLY THE ONLY REGULATOR OF VALUE.

2. *In such cases as production can be increased without limit, people learn to adjust the supply to the demand, so that the value of the article will nearly agree with its cost of production.*

76. But the mischievous consequences of the Ricardian doctrine of value, are far more widely extended than the mere formation of an erroneous Axiom. For the conception that *labour is the foundation of all value* has been the ruin and destruction of what we call the second school of Political Economy, (PRELIMINARY DISCOURSE). In the first place, it has narrowed the field of Political Economy to the smallest class of objects it treats about. For the quantities of which labor is apparently the cause of value, is by far the *smallest* class of Economic entities. It is this preconceived idea that labor must be the cause of value, and the necessity of squaring the whole theory of value with this conception, that has led Mr. McCulloch to class the growth of a tree, or the fermentation of wine or beer in a cellar, as *labor*! and which has caused some of the errors upon which his Theory of Absenteeism rests. The idea that labor is the cause of value is utterly inapplicable to far the largest proportion of objects. What has labour to do with the value of an instrument of credit? If a man picks up a diamond, what has labor to do with its value? What has labor to do with the value of deferred payments of all sorts? or with the value of land in towns? If labor is the foundation of value, how is it that a

vast deal of labor may be bestowed upon a thing and it shall have no value? If labour is the foundation of value, the rubbish in which a diamond is imbedded ought to have the same value as the diamond itself; or if a man, after a considerable amount of labour, were to find a number of diamonds of very different qualities together, they ought to be of the same value. Consequences which are notoriously erroneous. This, then, clearly proves that labor is not the *cause*, or the *source* of value, though in the majority of cases it is intimately associated with it. And these examples are adduced for the purpose of putting "Nature to the torture," and "trying Axioms as if by fire," and they are as certain and conclusive as any experiments whatever in experimental science. And it is by the judicious use of these *feigned cases*, and by subjecting them to the same rigorous tests as is usually done in Experimental Science, that Experiential Philosophy is to be raised to the rank of the exact sciences. Now, when we form this true conception, that the root and origin of value is *human desire*, and that whatever satisfies a human want, and for which men will give anything in exchange, is an independent entity. When we understand that any ОБЪЕКТ, whatever its nature be, material or immaterial, enduring or evanescent, which men will give something to obtain, is an independent quantity, and that the values of all entities depend purely on the intensity of the desire for them, and on the limitation of their quantity, no matter from what cause that limitation may proceed. And that all changes in value proceed, and proceed only, from a change in one of these quantities, either the intensity of the desire, or the limitation of the quantity. When we understand that a diamond is not valuable because a man picks it up, but a man picks it up because it is valuable; that, in truth, it is not labor that confers value, but value that attracts labor, we at once obtain a definiteness of conception of the objects we are treating about, and of the end in view, which fits the subject to be raised to the rank of an exact science.

77. Now, the question involved in the acceptance or rejection of the Ricardian system of Political Economy is no slight one; because it is, in fact, the rejection or the acceptance of all Modern Science. Ricardo and Modern Science cannot stand together. If we are to receive Ricardo, Bacon has written in vain, the starry Galileo with his woes, is a lesson lost to mankind, and that continuity of the sciences which Bacon was the first to inculcate, and so many eminent men have adopted and sanctioned since, is utterly broken. The Ricardian Political Economy is a battle-field upon which we are to decide whether we are to go back to the physics of the schoolmen, or to adopt those of Galileo. And when the real nature of the question is stated in the form of this decisive issue, there can be little doubt what the answer will be.

78. These observations have already proceeded to such a length that we have only space to consider one more leading instance of the transgression of the Baconian laws in the modern doctrines of Political Economy. In respect to the formation of Axioms, there is nothing more remarkable than the earnestness with which Bacon warns us against flying at the highest and most general ones first. In fact, it is in the very formation of

the highest Axioms, or first principles, that he places the strong contrast of his method of inquiry to the prevailing one. He says, *Nov. Org. Lib. I., Aph. 19*, "There are, and there can be, only two ways of investigating and discovering truth. The one flies from the senses and particulars to the most general Axioms, and from these principles, whose settled truth it assumes, it proceeds to judge and discover the middle Axioms. And this is the mode now in use. The other, from senses and particulars, forms principles, ascending gradually and continuously, so that it arrives at the most general Axioms last of all. And this is the true way, but not yet tried." So *Aph. 24*, "Axioms established by argument can never be of any avail for the discovery of new works, because the subtlety of nature is many times greater than the subtlety of argument. But Axioms, duly and properly formed from particulars, easily discover the way to new particulars, and so render the sciences active." So *Aph. 69*, "*That method of discovery and proof, by which the most general principles are first settled, then the middle Axioms are tried and proved by them, is the MOTHER OF ERROR AND THE CURSE OF ALL SCIENCE.*" So *Aphs. 103, 104*, "For our road does not lie in a plain, but ascends and descends. But yet the mind is not to be allowed to jump and to fly from particulars to the remote Axioms, and to those of almost the highest generality, (such as are called the first principles of arts and things), and prove and frame the middle Axioms by them as truths that cannot be shaken, which has been the practice hitherto. * * But then, at length there will be some good hope for the sciences, when we ascend from particulars to lesser Axioms, by a true scale, and by continuous steps, not interrupted or broken, and then to the middle Axioms, one above the other, and last of all, to the most general." So *Aph. 125*, "For the ancients themselves exhibit their form of investigation and discovery, and their writings shew it on their very faces. And that form was this: From a few examples and particulars (with the addition of common notions; and, perhaps some portion of the received opinions which pleased them most), they flew to the most general conclusions on the principles of the sciences, and, taking the truth of these as fixed and immovable, they proceeded, by means of the middle Axioms, to bring out and prove the lower principles—from which they framed the art. After that, if any new particulars and instances were brought forward and adduced, which were at variance with their dogmas, they cunningly brought them to agree with them by distinctions or modifications of their rules, or else coarsely got rid of them as exceptions; while to such particulars as were not opposed to them, they laboured pertinaciously to assign causes in conformity to their principles. But this was not the description of nature, or the experience, which was required—far from it, indeed; and that flying off to the most general principles was the ruin of all."

79. Every one who knows anything of the history of science, will readily call to mind the mode of argument which these sentences are levelled at. We can only refer to one as an amusing example, quoted by Sir John Herschel, from Galileo, of the mode of reasoning of the Aristotelians. The heavenly bodies, they said, must

move in perfect curves, but circles are the only perfect curves, therefore the heavenly bodies must move in circles. And this was a specimen of their beginning at the highest generalities and so reasoning downwards. Whereas the path the heavenly bodies did move in was discovered by laborious induction and not by *a priori* reasoning. Now, a very close parallel to this mode of reasoning is adopted by an influential class of thinkers in Political Economy at the present day. What quantity of paper currency may be safely issued, and the modes of ascertaining what are the proper tests for deciding whether it is over-abundant or not, are of the very first importance in Political Economy; they are, in fact, some of its highest generalities. Now, the writers alluded to fly at once to this highest generality, and lay it down as a dogma, "*That when bank notes are permitted to be issued they ought to be exactly equal in amount to the bullion they displace.*" Now this axiom itself, which is one of those highest generalities which Bacon alludes to, is not arrived at by any process of induction, but is a piece of pure DOGMATISM. It is a mere arbitrary assertion, not based upon any reasoning whatever. It is an exact parallel to the worst specimens of dogmatizing in Natural Philosophy, which it was the very object of Bacon's philosophy to overthrow. Now, the true way of obtaining the highest general principle of such a subject, is to proceed by a true induction, to discover what is the function of a metallic currency, and what influences its changes of value, then to ascertain what relations a paper currency bears to a metallic one, and how it is to be ascertained when a paper currency begins to be depreciated; and so step by step, by gradually proceeding from one principle to another, we shall at length attain the highest general principles of a paper currency. And when we proceed by this method we shall find that the dogma we have quoted above is a pure baseless fiction, having no more real foundation in nature than the Aristotelian notions of the movements of the heavenly bodies. But the result of that mode of arguing is this;—The persons who hold the theoretical opinion, wish practically to make legislation square with it, and they are very strong supporters of the Bank Act of 1844, on the supposition that that Act really carries that theory into practice. Now, any one who takes the trouble to read the article BANKING, in this Dictionary, and understands the mechanism of it, will see that the idea that the Bank Act of 1844 does actually carry this theory into effect, is one of the most signal delusions that ever deceived the country.

80. We must now reluctantly bring these remarks to a close. We have only selected a few prominent instances of the important effects of accurate notions, and not exhausted them. The considerations we have suggested would require a volume for their proper development, and duly treated would touch the foundations of all science. For somewhat fuller details we must refer to the PRELIMINARY DISCOURSE, and to each separate leading term in the subject. We shall have done some little good, if we call attention to the causes of the very incomplete state of Political Economy at the present time, and shew that this is not due to anything in the nature of the science itself, but to the method in which it has been treated. There is but one possible mode of succeeding—namely,

to follow the brilliant example set by Physicists. Almost all erroneous doctrine springs from erroneous definition. The only way to remove these *idola*, fallacies, or misconceptions, is to form true Definitions and Axioms by genuine Induction. The most eminent physicists thought no time lost, which was necessary to settle these elements, but Economists are apt to despise such things, and the consequence is, instead of the opinions of writers at the present day tending to uniformity, they are becoming more and more divergent every day. Theory and practice must be brought into harmony with each other. But, to elaborate a just theory from the facts, certain qualifications are absolutely indispensable:—1. A general knowledge of the mode of argument in Experimental Science, and a constant vigilance to see that the arguments in Political Economy are in strict conformity to the standards of reasoning in Natural Philosophy. 2. A technical knowledge of the law of instruments of credit, and some other things. 3. A technical knowledge of the mechanism of commerce and agriculture. Without these indispensable qualifications, it is a perilous task for any man to venture upon the troubled waters of Political Economy.

“Nave senza nocchiero in gran tempesta.”

When Galileo began to study Natural Philosophy he put aside mathematics, never dreaming that there could be any connection between the two; a sentiment, too, that appears in Bacon. Galileo very soon found out his mistake. Many persons at the present day may think that there is no connection between Political Economy and Natural Philosophy. They are in just as great an error as Galileo was. Political Economy is a science of causes and effects produced by the properties of men, and its types and standards of reasoning are to be found in the science which treats of the causes and effects produced by the properties of matter. In both equally, the Inductive Logic reigns supreme. The same general method of investigation is common to each. And there is the same hope and encouragement to expect future success, that the Athenian orator gave to his countrymen, because their failure arose—not from the nature of the enterprise, but from their own errors. So it is with Political Economy. The unsatisfactory state in which it is at present does not arise from the nature of the thing itself, but from its method of treatment. When Economists pay the same attention, as Physicists have done, to obtain true conceptions and axioms from reality itself by proper methods, and not by arbitrary dogmatism—when they proceed, step by step, Definition by Definition, Axiom by Axiom, principle by principle, in due and proper order, and maintain a proper unity of conception and principle, from the beginning to the end, it will be found that a vast and magnificent edifice of DEMONSTRATIVE truth may be reared up, and Political Economy will emerge from the haze

of controversy, a science as well defined, as self-coherent, as complete, and as harmonious as any in existence.

AYRES, HENRY,—Editor of the *Bankers' Circular and Financial Gazette*.

Financial Register of British and Foreign Funds, Banks, &c., &c., containing an account of the principal matters relating to the Finances of the United Kingdom, with a sketch of the Revenues, Expenditure, and Commerce of Foreign Nations; also an account of Foreign Banks, and Banking, and of Foreign Securities negotiated in London, &c., &c. London, 1857. To be continued annually.

This work contains in a moderate compass, a very large body of useful information.

The State of the Nation.—The Repeal of the Malt Tax.—The Re-adjustment of Taxation.

AZUNI, DOMINIQUE ALBERT,—Born at Sassari, in the isle of Sardinia, on the 3rd August, 1749. He became an advocate at Cagliari, and attained great reputation and practice as a commercial lawyer. He was named judge of the Consular Court at Nice, and a member of the Senate. When the French invaded Sardinia, he retired to Florence, where he published his Maritime Law of Europe, for which the Academy of Florence elected him a member. He wrote a paper to prove that the French were the first to use the compass. When Sardinia was united to the French Empire, Azuni was well received by the most eminent men of science there, and held several offices under the French Administration. He was appointed one of the committee to draw up the code of maritime commerce. When the French dominion came to an end, he was placed in much difficulty. But when the native government was restored, he was appointed judge of the Consulate, and director of the Library of the University, and he was elected a member of most of the learned Societies in Italy. He died 23rd January, 1827.

Dizionario universale ragionato della giurisprudenza mercantile. Nice, 1786-8.

Sistema universale dei principi del diritto marittimo d'Europa. Florence, 1795.

This last work was recast by the author, and published in French, as the

Droit maritime de l'Europe. Paris, 1798.

Dissertation sur l'origine de la boussole. Paris, 1805.

Histoire géographique, politique, et naturelle de la Sardaigne.

Origine du droit, et de la législation maritime. Paris, 1810.

Mémoires pour servir à l'histoire des voyages, maritimes des anciens navigateurs de Marseille. Genoa, 1813.

Mémoires pour servir à l'histoire de la Piraterie. Genoa, 1816.

B

BABBAGE, CHARLES,—F.R.S.L. and E., M.R.I.A., F.C.P.S., &c., corresponding member of the Institute of France. One of the most distinguished living men of science, was born about 1792. Educated at Trinity College, Cambridge,

where he graduated in 1814. He was elected a Fellow of the Royal Society in 1816. He was one of the founders of the Astronomical Society, and one of the originators of the Statistical Society of London, for the origin of which,

see his *Exposition* of 1851. In 1828 he was elected Lucasian Professor of Mathematics at Cambridge, which office he held till 1839. Mr. Babbage's chief reputation rests, of course, upon his treatises in Physical and Mathematical Science, which are beyond the limits of this work. But he has written also some excellent works in Political Economy.

A comparative view of the various Institutions for the Assurance of Lives. London, 1826.

On the Economy of Machinery and Manufactures. London, 1832. Fourth Edition, 1846.

This work was translated by order of the Governments of Prussia and Spain. It has also been translated twice into French, and also into Russian, and Italian.

Thoughts on the principles of Taxation, with reference to a Property Tax, and its exceptions. London, 1848.

A short but very excellent pamphlet, with some amusing anecdotes, on the Income Tax, shewing that all income of all sorts ought to be equally taxed.

The Exposition of 1851; or, Views of the Industry, the Science, and the Government of England. London, 1851.

An Analysis of the Statistics of the Clearing House, during the year 1839; with an appendix of the London and New York Clearing Houses, and on the London Railway Clearing House. London, 1856.

BABEUF, FRANCOIS NOEL,—Born at St. Quentin, in 1764, may be considered as the founder of Modern Socialism, or Communism. He was left an orphan at 16, and was apprenticed to an architect and surveyor at Roye, in the department of the Somme. When he was twenty-five years old, the French Revolution broke out, and he adopted its principles with enthusiasm, which he proclaimed with such violence in a paper he published at Amiens, called *Le Correspondant Picard*, that he was arrested and prosecuted; but he was acquitted on the 14th July, 1790. He was then appointed administrator of the department of the Somme, from which he was removed shortly to Montdidier. He was then charged with forgery, and indicted before the Court of the Aisne, but he had the good fortune to be again acquitted. Returning to Paris in July, 1794, he founded a paper named *Le Tribun du Peuple, ou le Défenseur de la liberté*, and, under the signature of *Caius Gracchus*, he wrote an article with the motto from Rousseau, *Le but de la Société est le bonheur commun*. He then adopted and advocated the most violent levelling and communistic doctrines (SOCIALISM). In 1796, Babeuf, the most violent in those violent times, had a considerable number of followers, who formed themselves into the *Babouviste Société*, or the *Pantheon*, with a secret executive committee of twelve. The conspirators gained over several of the regiments in the garrison in Paris, and the neighbourhood, and they also organized an insurrectionary army in the departments. They counted upon having 16,000 armed followers, and with these they intended to make a general attack on the Directory, the legislative assembly, and the chief of the staff, expecting to be joined by the artillery, and most of the other troops and the workmen. The conspiracy was on the very

point of exploding, when one of the number, Grisel, turned traitor, and denounced it to the Government. Barras caused Babeuf and sixty-five of his accomplices to be arrested on the 10th of May, 1797, at the very moment when they were met to give the signal to rise. The conspirators were immediately sent before the High Court of Vendôme. Babeuf and Darthé were sentenced to death, seven others to transportation, and the remainder were acquitted. Babeuf and Darthé immediately stabbed themselves in court, as soon as the sentence was given, but they were dragged out bleeding, and executed, on the 27th of May, 1797.

Babeuf was a remarkable person. He attempted to turn the current of the Revolution from political to social reform. He seems to have been the first to endeavour to bring to a practical experiment the visions of the philosophers of social dreamland—Plato, More, Campanello, Harrington, Bodin, Morelly, the latter of whom especially he seems to have taken as his model. It will be better to consider the doctrines of all this family of thinkers together, (SOCIALISM), than to treat them separately.

Besides his Communistic Journal above mentioned, he published, in conjunction with Audiffret,

Cadastre perpétuel, ou démonstration des procédés convenables, à la formation de cet important ouvrage. Paris, 1790. Dedicated to the National Assembly, and favourably received by it.

BABLOT LOUIS NICOLAS BENJAMIN,—Born at Vadenay, in Champagne, the 9th September, 1754. He studied at Rheims, and established himself as a physician at Châlons-sur-Marne, where he introduced vaccination. He died there, 24th November, 1802. Among several medical and other writings, including a poem, he left in Economy,

Mémoire sur la question proposée par l'Académie de Châlons, dans la séance publique du 25 Août, 1787; Quelles sont les causes les plus ordinaires de l'émigration des habitants de la campagne, vers les grandes villes, et quels seraient les moyens les plus propres à les retenir?

Examen de l'ouvrage de M. l'Evêque d'Autun (Talleyrand) intitulé, Des loteries. 1789.

Moyens d'assurer à chacun des individus de la République, sur la récolte actuelle, son approvisionnement en grains jusqu'à la récolte suivante. 1795.

BACON, FRANCIS, BARON VERULAM, VISCOUNT ST. ALBAN'S,—Born 22nd January, 1561,—died 9th April, 1626. The only Englishman, the intrinsic lustre of whose name ever shone through the plating of a title. Nay, in his case writers seem to be utterly nonplussed, for they will persist in calling him *Lord Bacon*, whereas they might just as well talk of *Lord Copley*, Baron Lyndhurst. Nay, even the standard new edition of his works, now publishing, is lettered "Lord" Bacon's Works. Bacon is entitled to be ranked among economical writers, because he has emphatically declared that the moral and political sciences are part of inductive philosophy; and his inductive logic is applicable to test the doctrines and axioms in Political Economy, in the same way as those of physical science, of

course *mutatis mutandis*. Moreover, in his essays, some sound economical remarks and observations occur.

BACON-TACON, P. J. JACQUES,—Born at Oyonnax in 1738. He travelled in Egypt and Greece, from whence he brought a bust of Alcibiades, which he attributed to Socrates, because that name was found on it. He then went to Russia, and taught languages at St. Petersburg. At the revolution he was chosen a Member of the Council-General of the Ain. In 1792 he went to Paris, and adopted literature as a profession. In 1796 the Directory gave him an appointment in the police, and employed him to watch public opinion in Lyons, and its neighbourhood. He was charged with forging assignats, but acquitted. Under the consulate and empire he kept away from Paris, and set up as a dealer in antiquities at Marseilles. In 1807 the court of Nantua sentenced him to three months' imprisonment, and a fine of 600 francs, for swindling. He came to Paris during the hundred days, and died there in 1817.

Adresse à l'Assemblée Nationale sur les billets patriotiques et les billets de sections, qui circulent à Paris, et dans les campagnes. Paris, 1791.

Nouvelle histoire numismatique des différents peuples anciens et modernes, et de tous les papiers-monnaies de l'Europe. Paris, 1792.

Opinion sur l'état de la France, sur le défaut de numéraire, et sur les moyens d'y remédier. Paris, 1791.

BACQUES, HONORE

Des arts industriels, et des expositions en France; recherches et études historiques, suivies de documents et de renseignements utiles, sur l'exposition de 1855. Paris, 1855.

BACQUET, JEAN,—An advocate, born at Paris, in the 16th century. In 1570 he was appointed counsel to the Treasury. He died in 1597.

Traité de l'établissement et de la juridiction de la Chambre du Trésor. Published in 1601. Best Edition, 1744. G.

BADEN, CHARLES FREDERICK, MAR-GRAVE OF,—Born at Carlsruhe, 22 November, 1728, and succeeded his grandfather in 1738. He studied at Lausanne, and travelled in France, Italy, England, and Holland, till his majority in 1750. He was of a liberal and enlightened mind, and greatly embellished his capital, and attracted many foreigners to it, by religious and political liberty. He kept his state out of the seven years' war, and in 1771 he succeeded his cousin, the Margrave of Baden-Baden. At the revolution he lost his property in Lorraine and Alsace. He made every compliance to maintain peace with France, even conniving at the seizure of the Duc d'Enghien, in 1804, and he published a decree against the emigrants, and followers of the Duke. In 1803 he took the title of Elector, and in 1806, Napoleon conferred upon him the title of Grand Duke. He adopted the Code Napoleon in his states, which he managed greatly to enlarge. He died 11 June, 1811.

Abbrégé des principes de l'Economie Politique. Carlsruhe, (Paris,) 1772.

A summary of the principles of Quesnay.

BAERT, ALEXANDRE BALTHASAR FRANÇOIS DE PAUL, LE BARON DE.—Born at Dunkerque, about 1750. He travelled in Russia, England, and Spain. In 1791 he was a member of the Legislative Assembly, and did all he could to save Louis XVI. After the 10th of August, 1792, he went to the United States, and travelled extensively, and did not return to France till after the 9th Thermidor. In 1815 and 1816 he sat in the Chamber of Deputies. He died at Paris, 23rd March, 1825. His work on England enjoyed the highest authority, and he was always consulted by Napoleon, whenever he wished exact information on English matters.

Tableau de la Grande Bretagne, de l'Irlande, et des possessions Anglaises, dans les quatre parties du monde. Paris, 1800.

Le Consommateur. Paris, 1802.

Mémoires historiques et géographiques, sur les pays situés entre la Mer Noire et la Mer Caspienne. Paris, 1799.

BAGARD, CHARLES.—Born at Nancy in 1696. Became a Doctor of Medicine, and died in 1772.

Recherches et observations sur la durée de la vie de l'homme. Nancy, 1754. G.

BAIGNOUX, P. PHILIP,—Formerly deputy for the department of the Indre-et-Loire.

Histoire philosophique de la réformation de l'état social en France, dans ses rapports avec l'inégalité des conditions, la propriété, les lois, les mœurs, et l'esprit général de la nation. Paris, 1829.

BAIL, C. J., LE CHEVALIER.—Born at Bethune, 29th January, 1777. He entered the army, and made the campaign in Belgium in 1793. In 1807 he was appointed to organize the administration of the Kingdom of Westphalia, of which he published the most complete and accurate statistical account extant. He held his office till 1818, when he retired on half-pay. He then devoted himself to the study of Political Economy, and besides several works on jurisprudence and politics, he published:—

Du cadastre considéré dans ses rapports avec l'Economie Politique, et la repartition des impôts. Paris, 1819.

Etat des Juifs en France, en Espagne, et en Italie, depuis le commencement du cinquième siècle de l'ère vulgaire, jusqu'à la fin du seizième, sous les rapports du droit civil, du commerce, et de la littérature. Paris, 1824.

Statistique des provinces de Westphalie. Göttingen, 1809.

Commerce des anciens et des modernes. l'Importation et la liberté du commerce des grains. Paris, 1814.

BAILEY, SAMUEL,—Of Sheffield, is the author of one of the most able little volumes on Political Economy in the language. It is entitled:—

A critical dissertation on the Nature, Measures,

and Causes of Value; chiefly in reference to the writings of Mr. Ricardo and his followers. London, 1825.

This treatise was written for the purpose of shewing the erroneous nature of the fundamental conceptions of Ricardo, Malthus, and some others, on the subject of Value, and the extraordinary self-contradictions and inconsistencies, into which they are betrayed by their neglect of observing a unity of conception on the point. And this it does with the most complete success.

It is one of the earliest treatises that revives and enforces the Aristotelian doctrine, that Value is an *external relation*, and not an *internal quality*, two things which are wholly inconsistent with each other, and this it does with a force and clearness which no other treatise of that period, which we are acquainted with, possesses.

It well deserves the careful perusal of every student in Political Economy. Not that it would be remarkable in any other science, because, in every other science, the necessity of obtaining clear, precise, and accurate fundamental conceptions, has long ago been recognized, nor would any writer have been listened to, one-half of whose work is a contradiction of the other half. But it is remarkable as carrying into Political Economy the same accuracy and precision as is demanded in every other science, and as shewing that all expressions and conceptions which are inconsistent with the fundamental ones, must be extirpated. Thus, having shewn that Value is an *external relation*, it follows that all such expressions as *absolute value*, *intrinsic value*, etc., are contradictory to the fundamental idea of Value, and should be abolished.

From the clearness and precision with which these views are enforced, this work, which is not by any means so well known as its merits deserve, is entitled to be held as one of those which have commenced the *THIRD ERA* of Political Economy—(*PRELIMINARY DISCOURSE*). We shall now give some extracts from this treatise, shewing how clearly the writer apprehended the true conception of Value.

He adopts, p. 4, the definition of Adam Smith, "That the value of an object expresses the power of purchasing other goods, which the possession of that object conveys." * * According to this definition, it is essential to value, that there should be two objects brought into comparison. It cannot be predicated of one thing considered alone, and without reference to another thing. If the value of an object is its power of purchasing, there must be something to purchase. *Value denotes, consequently, nothing POSITIVE or INTRINSIC, but merely the relation in which two objects stand to each other, as exchangeable commodities.*

"In the circumstance that it denotes a relation between two objects, and cannot be predicated of any commodity without an express, or implied reference to some other commodity, value bears a resemblance to *distance*. As we cannot speak of the distance of any object, without implying some other object, between which and the former this relation exists, so we cannot speak of the value of a commodity, but in reference to another commodity compared with it. A thing cannot be valuable in itself, without reference to another thing, any more than a

thing can be distant in itself, without reference to another thing."

"It follows, from this view of value as a *RELATION*, that it cannot alter as to one of the objects compared, without altering as to the other. It would be an absurdity to suppose that the value of A to B could alter, and not the value of B to A; that A could rise in value to B, and B remain stationary in value to A; an absurdity of much the same kind as supposing that the distance of the earth from the sun could be altered, while the distance of the sun from the earth remained as before."

He sees well that the term equality of values of two quantities, necessarily implies the nature of ratios. He says, p. 6,—"It may be objected to this representation of the relative nature of value, that when we say the value of A is equal to the value of B, the expression implies a quality intrinsic, and absolute in each; for, otherwise, how could we affirm that an equality existed between these two values? If the term denotes merely a relation between A and B, would it not be absurd to talk of the equality of their values, just as it would be absurd in speaking of the distance between the sun and the earth to talk of an equality of their distances from each other? * * * It will be found that in speaking of the value of A being equal to the value of B, we are led to use the expression by the constant reference which we unavoidably make to the relations of these commodities to *other commodities*, particularly to money; and the import of our language, in its whole extent, is that A and B bear an equal relation to a third commodity, or to commodities in general. * * * If we wish to know whether A and B are equal in value, we shall in most cases be under the necessity of finding the value of each in C; and when we affirm that the value of A is equal to the value of B, we mean only that the ratio of A to C is equal to the ratio of B to C."

He then shews well, that when we adhere to the conception of value being a relation, any such thing as a commodity of invariable value is an impossibility. He says, p. 9,—"The relative nature of value has not, it appears to me, been distinctly seen, or uniformly kept in view, by our best writers on the subject. Mr. Ricardo, for instance, who agrees with Dr. Smith in his definition of value, asserts that if any one commodity could be found, which now and at all times required precisely the same quantity of labor to produce it, that commodity would be of unvarying value."

"If value, however, denotes merely a relation, this proposition cannot be true. We may ask to what would this commodity bear an invariable value? what is the correlative? would it bear the same value to all other commodities? It might be so, it is true, but certainly not in consequence of being produced by an unvarying quantity of labor; for, while the labor in this instance remained a fixed quantity, yet, if the labor in other commodities were increased or diminished, the relations of value between this one commodity and all others, would, on Mr. Ricardo's own principle, be instantly altered."

"If corn, for example, always required precisely the same quantity of labor to produce it; but all other commodities whatever came to be

produced by half the labor formerly expended on them, the value of corn could in no sense be said to remain the same. In proof of this, take Mr. Ricardo's own definition of value, 'the power of purchasing other goods, which the possession of an object conveys.' To say that a commodity is of unvarying value, is, according to this definition, equivalent to saying that its power of purchasing other goods remains constantly uniform; or, to vary the language, that the quantity of other goods for which it will exchange never alters. But in the example we have adduced, the same quantity of corn would exchange for an increased quantity of any other commodity, and consequently, by Mr. Ricardo's own definition, would have risen in value.

"It may possibly be alleged, that it is not the corn, but other commodities which have varied in value, and, therefore, Mr. Ricardo's language is correct. If value were a positive and intrinsic quality, this might be true; but since it denotes a mere relation between two objects, to suppose any alteration could take place in this relation as to one and not as to the other, to suppose that the value of A to B could be altered, and not the value of B to A would, as I have already remarked, be as absurd as supposing that the distance of the sun from the earth could be increased or decreased, while the distance of the earth from the sun remained as before." * * *

"The contradiction involved in affirming the stationary or invariable value of any object, amid the variations of other things, is so direct and palpable that it may be instructive to point out the way in which a writer of such powers of reasoning, as Mr. Ricardo unquestionably possessed, has been led into so strange and manifest an error.

"Since value denotes a relation between two objects, no arguments are required to prove that it cannot arise from causes affecting only one of the objects, but must proceed from two causes, or two sets of causes, respectively operating on the objects between which the relation exists. If A is equal in value to B, this must be owing, not only to causes operating on A, but also to causes operating on B. The fact of a pound of gold exchanging for fifteen times the quantity of corn that can be obtained for a pound of silver, cannot be referred to causes operating on the corn, but to a difference in the causes operating on gold and silver. Hence, how constant or uniform soever, a cause affecting one commodity may be, it cannot make that object of constant value without the concurrence of other invariable causes, acting upon the commodity with which it is compared.

"It is precisely this essential circumstance which has escaped the notice of Mr. Ricardo. When he asserts that a commodity would be of invariable value, if it were always produced by the same quantity of labor; he overlooks one-half of the causes concerned in the determination of Value; for, a moment's consideration will teach us that such a commodity could be of invariable value, in relation to those commodities alone, of which the producing labor had also remained a constant quantity. Not adverting to this, Mr. Ricardo appears to have reasoned, that because the quantity of labor (according to his doctrine) is the cause of Value; if the cause in

any one commodity remains the same, the effect must necessarily be the same. But, granting his doctrine, that the quantity of labor determines value—it must be the quantity requisite for the production of each commodity compared, and not the quantity requisite for that of only one. The value of both, or their relation to each other, must necessarily vary with every change in the quantity of producing labor required for either.

"To assert, indeed, that the value of an object, or its relation to an object, was invariable; because whatever alteration has taken place in the latter object, the former had undergone no change in the conditions of its production, would be as absurd as to assert the unvarying likeness of a portrait to the original; because, however, the man had altered in feature, the portrait itself had retained precisely the same lineaments. The relation of value as well as the resemblance between two objects, depends upon both, and changes with a change in either of them."

Mr. Bailey then points out, p. 21—that the same error pervades Malthus's account of Value, and says, p. 23—"We have here *invariable, absolute, natural, nominal, and relative* Value; but, throughout the whole of the passage, the notion of Value as something intrinsic, or absolute, is apparent. Departing at once from his own definitions, he maintains that the value of an object may be affected—without affecting the value of the commodities for which it is exchanged; that is, that the power of A, in commanding B in exchange, may be altered, while the power of B commanding A, remains as before. Mr. Malthus has fallen into the same error, which we have already noticed in Mr. Ricardo; the error of supposing that, if a commodity continued the same in the circumstances of its production, it would retain the same value, amidst the fluctuations of other commodities. The inconsistency of this with the definition of value, has already been sufficiently exposed, and, as it is the basis of Mr. Malthus's notion of absolute value, that notion necessarily falls to the ground. *The very term ABSOLUTE VALUE, implies the same absurdity as ABSOLUTE DISTANCE*; while the invariable value of one object amidst the fluctuation of all other things, is as self-contradictory a notion as the invariable resemblance of a picture to the natural scenery from which it was taken, amidst all the vicissitudes of the seasons, the touches of time, and the encroachments of art.

"The same error runs through the whole of Mr. Malthus's pamphlet, entitled 'The Measure of Value Stated and Illustrated,' and is involved in the position which it is the object of that pamphlet to establish. He maintains, after Adam Smith, that labor is always of the same value, that is, according to his own definition, always retains the same power of commanding other objects in exchange; and yet, in the same treatise, he speaks of the laborer earning a greater or smaller quantity of money, or necessities, and insists that it is not the value of the labor which varies, but the value of the money, or the necessities. As if produce or money could change in value relatively to produce or money. But we need not be surprised at any implied inconsistencies in Mr. Malthus, when, after setting out with the definition which we have already quoted, that value is

'the power of commanding other objects in exchange,' or in other words, 'the power of purchasing,' he subsequently makes the direct assertion that, 'although money may increase in its power of purchasing, it does not necessarily increase in value.' If Mr. Malthus thus abandons his own definition, what other will he put in its place?"

He also exposes, with equal success, the self contradictions of Ricardo. "Although he, (Ricardo), agrees with Dr. Smith, in defining value to express the power of purchasing; and although in the very first proposition in his book, he speaks of the value of a commodity as synonymous with the quantity of any other commodity for which it will exchange, yet in another chapter of his work he says, 'I cannot agree with M. Say in estimating the value of a commodity by the abundance of other commodities for which it will exchange.' In accordance with the definition, this means that he cannot agree with M. Say in estimating the power of a commodity to purchase other commodities by the quantity of the latter, which it will purchase. But if the power of a commodity to purchase be not measured by the quantity purchased, what other mode of estimation can be found? It is no great degree of boldness to challenge the whole body of economists to produce a different meaning of the word power, or a different measure of its degrees."

He then brings forward a similar error in one of Mr. Ricardo's followers, the author of the *Templars' Dialogues on Political Economy*, (Dr. QUINCEY); and he thus shews the fundamental error of them both. "The mistake, both in this writer and in Mr. Ricardo, evidently arises from an inaccurate apprehension of the true nature of value. Instead of regarding value as a relation between two objects, they seem to consider it as a *positive result, produced by a definite quantity of labor*. If the quantity of labor necessary for the production of an object is always the same, the value according to them is always the same, however other objects may have varied; so that, in fact, the circumstance of its being produced by a certain quantity of labor, constitutes its value, independently of any other circumstances."

He thus brings together the manifest truth on the subject. "The following propositions may be stated, as the results of the investigation in which we have been employed. Simple as they appear, we have seen that it is possible to overlook them:—

"1. Inasmuch as the term value denotes a relation between two objects, a commodity cannot be said to possess value, or to alter in value, without an express or implied reference to some other commodity. Its value must be value in something, or in relation to something.

"2. This relation between two objects cannot alter as to one, without altering as to the other. If A rises in relation to B, B cannot remain stationary, but must fall in relation to A.

"3. The value of a commodity can be expressed only by a quantity of some other commodity.

"4. A rise in the value of a commodity A, means that an equal quantity of this commodity exchanges for a greater quantity than before of the commodity B, in relation to which it is said to rise.

"5. A fall in the value of A means, that an equal quantity of it exchanges for a smaller quantity of B."

"In the examination of the present subject as discussed by those writers, on whose doctrines I have ventured to animadvert, I have been forcibly struck with the vagueness, the inconsistencies, and the errors, which have arisen from speaking of value as a *sort of general and independent property*, and I cannot too strongly recommend the student of Political Economy, never to let the word value pass before him, without putting the question, 'value in what?' or, 'in relation to what?' The value of a commodity must be its value in something, and whenever the term is used with any definite meaning, that something may be assigned. If it cannot be assigned, the reader may rest assured that the author, whoever he be, is writing without any determinate ideas. Whoever resolutely applies this rule in reading our economical writers will be surprised and pleased at the light it will pour over their pages. The most difficult and obscure passages will frequently brighten into perspicuity, and the sum of their truth, as well as of their error, will stand apparent. The brilliant paradox, the ingenious fallacy, the seemingly profound observation, will separate into two distinct parts, one exhibiting the gaudy fragments of sophistry and delusion, the other the simple truth, which they only served to hide with their cumbrous splendour."

In the second chapter Mr. Bailey shews the entirely arbitrary and unfounded distinction between real and nominal value, adopted by Adam Smith, Malthus, Ricardo, and De Quincey.

The third chapter is a refutation of Ricardo's views of the value of labor, and the fourth chapter of the same writer's doctrine of profits, which shews the error of Ricardo's views to a certain extent, but he has not succeeded in seizing Ricardo's master fallacy, which is in not seeing that the *rate of profit* must be reduced to the same standard as the *rate of interest*. (PROFIT.)

The fifth chapter is on the method of comparing commodities at different periods, in which he well shews that the value of the same commodities at different periods cannot be compared, p. 71:—"It is a direct inference from the explanation of value, in the preceding chapters, as denoting a relation between two commodities—a relation incapable of existing when there is only one commodity, that it cannot exist between a commodity at one period, and the same commodity at another period. We cannot ascertain the relation of cloth at one time to cloth at another, as we can ascertain the relation of cloth to corn in the present day. All that we can do is, to compare the relation in which cloth stood at each period to some other commodity. When we say that an article in a former age was of a certain value, we mean that it exchanged for a certain quantity of some other commodity. But this is an inapplicable expression in speaking of only one commodity at two different periods. We cannot say that a pair of stockings in James the First's reign would exchange for six pair in our own day; and we, therefore, cannot say that a pair in James the First's reign was equal in value to six pair now, without reference to some other article.

"Value is a relation between *contemporary*

commodities, because such only admit of being exchanged for each other; and, if we compare the value of a commodity at one time with its value at another, it is only a comparison of the relation in which it stood at these different times to some other commodity. It is not a comparison of some intrinsic, independent quality at one period, with the same quality at another period; but a comparison of ratios, or a comparison of the relative quantities in which commodities exchanged for each other at two different epochs. If a commodity A, in the year 100, was worth 2 B, and in 1800 was worth 4 B, we should say that A had doubled its value to B. But this, which is the only kind of comparison we can institute, would not give us any relation between A in 100 and A in 1800; it would be simply a comparison of the relation between A and B in each of those years.

"It is impossible for a direct relation of value to exist between A in 100, and A in 1800, just as it is impossible for the relation of distance to exist between the sun at the former period, and the sun at the latter. This, perhaps, will be still more apparent, if we make use of the definition of value instead of the term. It will at once be seen how absurd it would be to talk of the power of A in the year 100, to command in exchange, the same commodity in 1800. * * *

"When Mr. Ricardo tells us that a commodity always produced by the same labor is of invariable value, he implicitly maintains all I have been attempting to disprove. By the epithet invariable, he clearly means that its value at one time will be precisely the same as its value at another, not in relation to other commodities, for he supposes all other commodities to vary, but in relation to itself. He distinctly states that, if equal quantities of gold could always be obtained by equal quantities of labor, the value of gold 'would be invariable, and it would be eminently well calculated to measure the varying value of *all other things*,' whence it follows, that this invariableness must be intended to be affirmed of the value of gold compared with itself, and not of any relation between gold and some other commodity.

"The same remarks apply to all attempts to find out something of invariable value. Adam Smith and Mr. Malthus, in considering labor alone as never varying in its own value, assert, by implication, that labor at one period may be compared in value with labor at another period, without reference to any other thing whatever. I fully concede that such a notion involves an absurdity, that they might have talked with equal propriety of the possibility of comparing the distance of the sun in the year 100, with its distance in 1800, without reference to any other body in space; and that language can scarcely be found to express the idea in direct terms, without a palpable contradiction; but that such a notion has extensively prevailed, no one will doubt who attentively turns over the pages of the first writers on the subject." And he further criticizes Ricardo's and Mr. De Quincey's views on this subject.

In the sixth chapter he points out the great errors prevailing in respect of the term measure of value. He explains well the fallacy of the analogy which was so commonly supposed to exist between a measure of weight or length,

and a measure of value. This is a most valuable chapter, and by the doctrines established in it, he tests the measure of value proposed by Mr. Malthus in the following one, and well shews its fallacy. The eighth chapter shews the fallacy of Ricardo's mode of estimating value. The ninth chapter is on the distinction between value and riches. The tenth on the difference between a measure and a cause of value. The eleventh and last is on the causes of value. In this he sees that the cause of value does not reside in the labor of producing, but in the mind. He says, p. 180, "It was explained in the first chapter, that value, although spoken of as a quality adhering to external objects, or as relation between them, implies a feeling or state of mind, which manifests itself in the determination of the will. This feeling or state of the mind may be the result of a variety of considerations, connected with exchangeable commodities, and an inquiry into the causes of value is, in reality, an inquiry into these external circumstances, which operate so steadily upon the minds of men in the interchange of the necessities, comforts, and conveniences of life, as to be subjects of inference and calculation."

Thus Mr. Bailey accurately sees that the source or foundation of value resides in the *mind*, and not in *labor*, as the second school of Political Economy held.

But he has gone one step too far in the consideration of causes, p. 199. "It has been shewn that the immediate causes of value are the considerations, which act on the minds of human beings, *and that the circumstances which form or furnish those considerations must be the causes into which the economist has to inquire*. We have shewn (PRELIMINARY DISCUSSION), that the causes which act upon the mind are beyond the pale of Political Economy. Having got his motive power, the Political Economist, quâ Economist, has no business to inquire any further, any more than the engineer cares to inquire into the chemical causes of the power of steam, or the astronomer to inquire into the metaphysical causes of gravity. Each of these inquiries belongs to a superior science, and it is absolutely essential that a due gradation of sciences be observed. The question of the causes of the considerations which act upon the mind belongs to the science of Morals, and not to Political Economy, and must be kept essentially distinct.

Mr. Bailey then shews the fallacy of the Axioms obtained by Ricardo and his followers, p. 207—"It is manifest that, if the unqualified doctrine as laid down by some writers, were correct, the value of any commodity would be strictly representative of the quantity of labor expended on its production from first to last. 'If,' as Mr. Mill expresses it, 'quantity of labor in the last resort, determines the proportion in which commodities exchange for one another,' or, as it is stated by the author of the *Templars' Dialogues*, 'commodities are to each other in value as the quantities of labor employed in their production;' or, as it is laid down by Mr. McCulloch, 'the exchangeable value, or relative worth of commodities as compared with each other, depends exclusively on the quantities of labor necessarily required to produce them;' then it

follows that any two commodities which, at any time, exchange for each other, (putting aside all fluctuations of market value,) must have been produced by exactly the same quantity of labor. If a quarter of wheat is exchanged for a piece of linen, these two commodities must have required the same labor to bring them to the condition in which they are exchanged.

"Now, this cannot be true, if we can find any instances of the following nature:—

"1. Cases in which two commodities have been produced by an equal quantity of labor, and yet sell for different quantities of money.

"2. Cases in which two commodities once equal in value, have become unequal in value, without any change in the quantity of labor respectively employed in each."

"Cases of the first kind are exceedingly numerous." And he enumerates a number of cases under each head, which shew that the general rule proposed by these writers, is quite fallacious. And he notices the most extraordinary doctrine maintained by Mr. James Mill, and subsequently adopted by Mr. McCulloch,—“The author of the Elements of Political Economy, has made a curious attempt to resolve the effects of time into expenditure of labor. ‘If,’ says he, ‘the wine which is put into the cellar is increased in value one-tenth by being kept a year, one-tenth more of labor may be correctly considered as having been expended upon it.’”

"Now, if any one proposition can be affirmed without dispute, it is this, that a fact can be correctly considered as having taken place, only when it really has taken place. In the instance adduced, no human being, by the terms of the supposition, has approached the wine, or spent upon it a moment or a single motion of his muscles. As, therefore, no labor has been really exercised in any way relating to the wine, a tenth more of labor cannot be correctly considered as having been expended upon it, unless that can be truly regarded as having occurred, which never happened."

This strange hypothesis is an example of the shifts men are driven to, when they take up one preconceived idea, and are determined to square everything by it. A very apt example of Bacon's Aphorism already quoted.

In a note at page 239, he points out that Ricardo has used the word Value in seven senses, and yet he is usually praised for his consistency in the use of that fundamental term!

This little work well deserves the most attentive study, but like all others of its character, which is merely destructive, or an exposure of fundamental fallacies, it is in danger of passing into oblivion, however successful it may be in its purpose. A work to have vitality must be constructive. It is this which has given vitality to Ricardo's work, because, however erroneous it may be, it is constructive, and there can be no hope of superseding it until a constructive work be written, on opposite principles.

This work having been attacked in very coarse terms in an article in the *Westminster Review*, Mr. Bailey replied in,

A letter to a Political Economist, occasioned by an article in the "Westminster Review," on the subject of Value. London, 1826.

Money and its vicissitudes in Value, as they

BAILLY, ANTOINE,—Born at Paris, 20th November, 1780. Inspector General of the Finances. Died in 1851.

Histoire financière de la France, depuis l'origine de la monarchie, jusqu'à la fin de 1789, avec

un tableau général des anciennes impositions, et un état des recettes, et des dépenses du trésor royal, à la même époque. Paris, 1820.

Exposé de l'administration générale des finances du Royaume-Uni de la Grande Bretagne et d'Irlande, contenant des documents sur l'échiquier, la dette nationale, les banques, les navigations, les consommations, &c.; sur le produit et l'emploi des contributions, droits, taxes, péages et émoluments perçus par l'état, le clergé, la magistrature, les comtés, les paroisses, les corporations, les titulaires d'offices. Paris, 1837.

These two works are the best on their respective subjects. The author was sent on a special mission, and resided for a long time in Great Britain, to study the details of the financial system, and had official documents put at his disposal.

BAILLY, JOSEPH,—Born at Besançon in 1779. He studied medicine, and accompanied the French Expedition to St. Domingo, as health officer. He also was present at the campaigns in Germany and Russia; and in 1823 was chief of the medical staff in the Expedition to Spain. He died 15th December, 1832.

Essai sur l'agriculture dans ses rapports avec les arts industriels.

Recherches sur les moyens employés successivement en France pour extirper la mendicité, et réprimer le vagabondage.

BAILY, FRANCIS,—Born in Berkshire in 1774. He was for many years a member of the Stock Exchange, and, in some differences they had with the Corporation of London, he wrote some pamphlets on their side, which gained him much popularity. He also published some works on assurances, which were held in high esteem in this country and abroad. In 1820 he was one of the founders of the Astronomical Society, and for some time President. The reform of the *Nautical Almanack* was brought about, greatly by his influence. He retired from business in 1825, with a large fortune, and thenceforth devoted himself entirely to astronomical pursuits, in which he acquired a high reputation. He was employed by Government to fix the standard yard measure, which had been lost in the fire at the Houses of Parliament in 1834. He was also engaged in many other scientific investigations. He died 30th August, 1844. He was a Fellow of the Royal Society, and a Corresponding Member of the Institute of France.

Tables for the Purchasing and Renewing of Leases, &c. London, 1802.

BALANCE OF TRADE.—This expression is a pregnant example of Bacon's aphorism that the fallacies of language are the most troublesome of all, and of the extreme difficulty of eradicating those which have some portion of truth in them. It is also a conclusive reply to those persons who think that attention to the meaning of words is of no consequence in Political Economy. It is a most humiliating instance of the way in which the most eminent Statesmen and the most enlightened nations may be duped and misled for a long course of time by an expression, which, when it comes to be analysed and probed by men who begin to investigate the true nature of things, is discovered to be the most palpable delusion that ever deceived the senses of mankind.

2. This amazing fallacy may now be considered to be exploded among all men who have the slightest pretensions to any real knowledge of the matter, though it does still linger in a few quarters. Its overthrow gave rise to what we call the first school of Political Economy of modern times, founded by Quesnay, and the economists of the eighteenth century. It may claim some attention at our hands because its explanation will well illustrate some of the fundamental principles of Political Economy.

3. As this error, however extensively it prevailed, or however important it was in its day, is now exploded, we shall not spend much time in deciding where it arose. It is sufficient to say that England, France, and Italy, all contend for the honor of the cap and bells. A considerable number of writers in each country contributed to establish it, nor do we care to settle the priority of folly. Though Spain may, probably, be really entitled to it. In the conquest of the new world, gold was their chief object of ambition. The new acquisitions were estimated chiefly as they were capable of producing the precious metals. From

this the idea gradually extended and prevailed, that the precious metals were the only species of wealth; and, by a confusion of ideas, it was supposed that the object of all trade was to acquire the precious metals. It followed from this that the profits of trade were estimated just as they brought in gold and silver. It is said that an Italian writer, Botero, in the sixteenth century, was one of the earliest to adopt this doctrine. Montaigne stands one of the first in this bad company, for he lays it down that, in trading, whatever one party *gains*, the other party must *lose*. A doctrine absurd on the face of it, because, if one party lost, why should he continue to trade? It is clear on the slightest reflection that, in commerce, *both* sides must gain, for if not, it would immediately cease.

4. Having thus adopted the opinion that gold and silver were the only species of wealth, that, in commerce, what one side gained the other lost; they then began to estimate how much the gain or the loss was, and they did it in this way:—They said that, if the exports of a country exceeded the imports in *value*, that the *balance* must be received in money, and that, if the imports exceeded the exports, the balance must be paid in money. The difference in value between the exports and the imports was called the *Balance of Trade*, which, it was assumed, must be paid in money, and the trade of a country was considered favorable or adverse, according as the balance was for or against it. That is to say, the profit was held to consist in the quantity by which the value of the exports exceeded the value of the imports, and the loss was held to consist in the quantity by which the value of the imports exceeded the value of the exports.

5. In order to place the matter still more clearly before our readers, we will give a statement of it from some eminent witnesses. Mr. Irving, Inspector-General of Imports and Exports, being examined before the Committee of Secrecy in 1797, was asked what the meaning of the expression was, and he said, "The common mode of considering that question has been to set off the value of the imports, as stated in the public accounts, against the value of the exports, and the difference between the one and the other has been considered as the measure of the increase or decrease of the national profit." And, Mr. Hoare, a banker of eminence for twenty-two years, said, "I consider the only proper means of bringing gold and silver into this country to arise from the surplus of our exports over our imports, and that ratio or proportion, which is not imported in goods, must be paid for in bullion. In the year 1796, the imports of this country appear to be £19,788,923, and the exports appear to be £33,454,583, which ought to have brought to this country bullion, to the amount of that difference, or £10,665,660." So also, Necker (*De l'administration des finances de la France. Vol. II., p. 108*) says, "Le tableau de la balance du commerce, est la représentation des échanges d'une nation avec les autres nations; cette balance paraît favorable lorsque la somme de ses exportations est plus considérable que celle de ses importations; elle lui annonce une *perte*, lorsqu'au contraire il a plus acheté que vendu."

6. Notwithstanding this concurrence of emi-

nent men on this subject, the very statement of the question as given by them carries on the face of it, the most palpable evidence of its folly to any one who takes the trouble to reflect. In the first place, even supposing the value of the exports is given correctly, it is taken at their cost price before they leave the country, and before any expenses of transport, &c., have been added to it. On the contrary, the value of the imports is taken including the expenses of transport, &c. So that it is quite clear that unless the value of the imports exceeds the value of the exports by sufficient to defray all expenses of transport of both cargoes, the trade must be an absolute loss. Thus, let us suppose that the value of the exports is £1,000, at the time they leave the shores of England, by the time they reach South America say, the expenses of transport, insurance, &c., will probably make their cost of production, or the expense of placing them in the foreign market, £1,050, which sum they must fetch, if they are not to leave an absolute loss on the transaction. Now, if we imagine them sold at that sum, and the proceeds invested in country produce and remitted to England, the value of that produce before it leaves the foreign market would be £1,050, by the time it reaches England the expenses of freight, insurance, &c., may well amount to £50 more, so that unless the value of the import be £1,100, there will be an absolute loss upon the transaction. But it is quite evident that the profit of the merchant entirely consists in the value of the import exceeding the value of the export, and the measure of his profit is exactly the quantity by which the import exceeds the export in value, after deducting the expenses of transport, insurance, &c., both ways.

7. Let us take a very simple example of the rudest description of trading, which will yet be found to illustrate it as well as the most elaborate. When our ships first traded to the South Sea Islands, they took with them axes, coloured beads, and other trifles, which were of very little value in this country, and bartered them for all sorts of curiosities, shells, &c., which were very valuable in England. A pair of fine shells from the South Seas, in many cases, is worth ten guineas in England, which perhaps an English sailor obtained in exchange for an axe which cost 2s. 6d. The English sailors thought the natives very simple to give away so many valuable curiosities for such common things. We cannot doubt that the natives had exactly the same opinion of the English sailors; they thought them great simpletons to give away such valuable things as axes, beads, &c., for so common things as a few shells. Each party, however, exchanged what was common and cheap in his own country, for what was scarce and valuable. The axes were infinitely more valuable in Feejee than the shells, the shells were many times more valuable in London than the axes. Thus, an English sailor, by giving away perhaps 2s. 6d., gained in exchange what was worth ten guineas, and the difference was his profit. And thus both parties gained by the commerce. The shells were worth many axes in London, the axes were worth many shells in Feejee; and this is the genuine spirit of commerce. This simple transaction is a type of all commerce. The value of the shells in London arises from the desire of the people in London to

possess them, and their scarcity; the value of the axe in Feejee arises from the great desire of the Feejeans to possess it, and the scarcity of axes there. The coloured beads were just as valuable to the poor untutored savages, as diamonds to civilized Europeans. The commerce of all nations is exactly similar in principle to that between the sailors and the savages. It all consists in exchanging things which are comparatively cheap and common in two countries for what are dear and scarce in them reciprocally, and of course both parties must gain by the very nature of the case. But, according to the old doctrine of the Balance of Trade, England having given an axe worth 2s. 6d., and received a pair of shells worth ten guineas, still owed the balance which required to be paid in gold!

8. When we state the doctrine thus, in all its naked absurdity, it is scarcely credible that it could impose on the intellect of a child, much less upon a clerk who had been six months in a merchant's office. But, nevertheless, such is the unaccountable facility with which mankind is sometimes gulled and befooled by the most transparent sophism; nay, the plainer it is sometimes, the more easily does it deceive, that for 200 years and more the greatest statesmen were implicit believers in this doctrine of the Balance of Trade; and it was conceived to be the height of commercial and political wisdom to frame legislation so as to secure a favorable Balance of Trade. Nay, J. B. Say says, "that during 200 years, during which statesmen were blinded with this strong delusion, no less than fifty years were spent in commercial wars, arising directly out of this stupendous folly. Fifty years of war with its unutterable horrors waged for a chimera—a fiction—a thing which had absolutely no existence at all! Do we not say truly, when we say that true and sound views of Political Economy are of the utmost importance to mankind? True Political Economy has turned the light of science on a single expression, and the result has been to destroy for ever a fallacy which let loose upon the earth the demon of war for fifty years!

9. And this was the immortal service, which QUENET and his followers, the Economists of the 18th century, did to mankind. They entirely overthrew this insensate Doctrine of the Balance of Trade, and thereby laid the foundations of modern Political Economy. No doubt they, too, fell into errors, and their leading doctrines have passed away. But their supereminent merit, of which nothing can deprive them, was that they overthrew the doctrine of the Balance of Trade, for which they deserve the eternal gratitude of mankind, as having been the pioneers of the true system.

10. And we observe that this great delusion turns a good deal upon the confusion of ideas about a word, because it was supposed that if the value of the imports exceeded the exports, the difference must be paid in money, whereas so long as the imports were the actual exchange, or payment for the exports, it is quite clear that there was no debt at all, and consequently nothing to pay. But it sometimes happens that goods, or commodities, are imported, which are not paid for in commodities, and then money must be paid for these goods; or if a certain species of article is very much wanted in this country, and there are

no commodities at hand to pay for them, it sometimes happens that bullion requires to be sent; and when this is the case the EXCHANGES are said to be unfavourable. These circumstances, and some others, give rise to the Theory of the Foreign Exchanges, which is fully discussed in its proper place (EXCHANGES, FOREIGN).

11. The doctrine of the Balance of Trade being so thoroughly exploded now, may be considered as having lost much of its interest; but those who wish to see it treated more at length, may refer to Adam Smith, Book IV., chaps. 1-8, J. B. Say.—*Traité d'Economie Politique*, Book I. c. 17, p. 139-173, or his *Cours d'Economie Politique*, Part IV., chaps. 11, 12, 13. Edition, Guillaumin. Also to the *Sophismes Economiques* of Bastiat, p. 76.

BALBI, ADRIANO,—Born at Venice, 25th April, 1782. A celebrated Geographer, Professor of Physics and Geography there. In 1820 he married and went to Portugal, where he became acquainted with the principal statesmen, and men of science, and he was furnished by the government with materials for his work on Portuguese statistics. He then went to Paris, and published in French a large geographical work, embodying the results of German research in ethnology and philology. He received the assistance of most of the eminent men of Europe, especially A. von Humboldt, and was assisted by the French government. He died 13th March, 1848.

Essai statistique sur le royaume du Portugal et d'Algarve, comparé aux autres états de l'Europe. Paris, 1822.

Variétés politiques et statistiques de la monarchie Portugaise. Paris, 1822.

La monarchie Française comparée aux principaux états de l'Europe. Paris, 1828.

L'Empire Russe comparé aux principaux états du monde. Paris, 1829.

The World compared with the British Empire 1830.

Statistique comparé de l'instruction et du nombre des crimes dans les divers arrondissements, des académies, et des cours royales de France. Paris, 1829.

BALD, ROBERT,—Civil Engineer.

A general View of the Coal Trade of Scotland, chiefly that of the River Forth and Midlothian. Edinburgh, 1812.

BALDASSERONI ASCANTIO.—A judge in the Revenue Court of Leghorn.

Trattato dell'Assicurazione Marittima, del cambio marittimo, dell'Avaria, e leggi, e costumi. Firenze, 1801.

BALDASSERONI, POMPEO,—Brother of the preceding, born at Leghorn about the middle of the 18th century. He studied law at Pisa, and having filled some inferior positions at Sienna and Genoa, he was appointed a member of the High Court of Modena, and then one of the Court of Appeal at Brescia, where he died in 1807.

Leggi e costumi del cambio, ossia trattato delle lettere del cambio. Modena, 1805.

BALLERINI, PIETRO,—Born at Verona, 7 September, 1698; a celebrated ecclesiastical

writer of the 18th century. Having engaged in a warm controversy about *usury* with Scipio Maffei, he published several works on the subject. He died about 1764.

De jure divino et naturali circa usuram libri sex.

Vindiciæ juris divini ac naturalis.

BALLOIS, LEWIS JOSEPH PHILIP,—Born at Périgueux (Dordogne) in 1778. He published at Bordeaux an excellent newspaper, *l'Observateur de la Dordogne*. In 1798 his countryman, Lamarque, being appointed ambassador to Sweden, chose him his secretary, but the appointment being refused confirmation by the Directory, Ballois was so much chagrined that he tried to commit suicide, but did not succeed. At the 18th Brumaire his paper was suppressed, and he then devoted himself to Political Economy. He was elected a member of the Academy of Bordeaux, and associate correspondent of the Polytechnic Society, a member of the Academy of Legislation, and perpetual secretary of the Statistical Society founded at Paris 5th February, 1803. He died the same year from the consequences of his wound.

Annales de Statistique Française et étrangère. Paris, 1802.

Sur l'Agriculture, les finances, les statistiques, de longéité; suivie d'un aperçu sur les sources du revenu public. Translated from a work of Sir John Sinclair. Paris, 1802.

BALSAMO, PAOLO, L'ABBATE.—Born at Termini, in Sicily, 7th March, 1763. An Italian agriculturist and economist, whose works are still held in high repute. He was appointed Professor of Agriculture in the University of Palermo, and enjoyed the profits of a rich Abbacy. He was sent by the government of Naples to Lombardy, France, and England, where he formed an intimacy with Arthur Young, the author of *Annals of Agriculture*. He proposed many financial reforms, which were adopted by the king, who appointed him his librarian. These reforms had for their object, a more equal distribution of taxation, which weighed heavily and unjustly upon agriculture. He died at Palermo in 1818. Among his contributions to agricultural economy are:—

Il costante vile prezzo di generi non denota e non cagiona ricchezza ed prosperità nello stato.

Lo spendersi del denaro in un paese quali utili effetti produca nel paese medesimo.

Gli interessi nazionali e la giustizia richiedono che non si avvilisca il valore della moneta.

Diligence e pratiche perchè li vini regger possono alla navigazione ed alla lunga conservazione.

Sopra la birra, il sidro, e l'idromele.

Pensieri sopra l'agricoltura di Sicilia.

Sopra l'influenza delle scienze nel miglioramento delle arti.

Sopra il piacere dell'agricoltura, memoria di A. Young; tradotta dall'Inglese.

Sopra i dazi relativamente all'agricoltura, ed alla ricchezza nazionale.

La sentenza del villano.—Il villano filosofo.

BANDINEL, JAMES.

Some account of the Trade in Slaves from Africa, as connected with Europe, and America,

from the introduction of the Trade into modern Europe down to the present time; especially with reference to the efforts made by the British Government for its extinction. London, 1842.

BANDINI, SALUSTIO ANTONIO.—Born at Sienna, 10th April, 1677. An Italian economist, who was designed by his family for a military career, but had such a taste for science, that he applied himself to study the causes which produced the unhealthiness of the marshes of Sienna, and he published a work of great utility on this subject, which guided the Emperor Francis I., and his son the Grand Duke Leopold, in their plans of reclaiming the Maremma of Sienna. He became Archdeacon and President of the Physico-critical Academy of Sienna. He was also author of a work which has been supposed by some to have been the foundation of the doctrine of the school of Economists in France. But though it was written in 1737, it was not published till 1775, long after Quesnay had published his doctrine. It is included in Custodi's Collection. Bandini died in 1760.

Discorso Economico. 1737.

BANFIELD, T. C.

The organisation of industry; explained in a course of lectures, delivered in the University of Cambridge. London, 1844.

The Statistical Companion for 1850.

BANK.—Banking is one of the two grand divisions of the mighty subject of Credit, which is to commerce what the steam engine is to mechanics, or the differential calculus to mathematics. The subject is one of immense importance in Political Economy and will demand much attention, because we shall endeavour to show that the current doctrines of the day on Banking and Credit, are as complete a misconception of the subject, as the doctrine of the *Balance of Trade* was in its day, and that both delusions spring from the very same cause, a want of attention to the facts of the case.

2. Before, however, making any comments on the current opinions, or reviewing the doctrines of any writer, we shall lay before our readers an exact description of the actual mechanism of Banking, and we shall draw no inferences except such as arise naturally out of the facts detailed. Having thus laid a solid foundation, by exhibiting the facts of the case, we shall then proceed to examine the current opinions, and test the doctrines of certain writers by that standard.

3. It will tend much to clear up the subject, if we begin by a short inquiry into the meaning of the words "A BANK," and to BANK, and what the functions of the first Banks were. It is usual to derive the word Bank from the Italian word *banco*, a bench, because the first money changers in that country used to pile their money on a bench. It may possibly be that the word "banker" comes from the low latin word *Bancharius*, but if this be so, paradoxical as it may appear, it seems very doubtful if the words A BANK and to BANK have any etymological connection with "banker." At all events, however that may be, the words "a bank," and "to bank," have acquired a meaning altogether different from that of the business of the persons who employed a *banco*, or bench.

4. We may observe that the word in Italian

for a joint-stock, or common fund, is *Monte*, a heap, a *BANK*, formed by the contributions of various persons. Thus, the public loans were always called *Monte*, and it was the commissioners charged with the management of the public loans of Venice, called *Monti*, who were formed into the Bank of Venice. So, in a little tract entitled *A Discourse concerning Banks*, published in 1697, and known to be by a director of the Bank of England, and by some supposed to be by Paterson its projector, it says that there are three kinds of Banks, the first for the mere deposit of money, the second for profit. "The Banks of the second kind, called in Italy *Monte*, which are for the benefit of the income only, are the Banks of Rome, Bologna, and Milan. These banks are made up of a number of persons, who, in time of war, or other exigencies of the State, advanced sums of money upon funds granted in *perpetuum*, but redeemable." "The third kind of Banks, which are both for the convenience of the public, and the advantage of the undertakers, are the several Banks of Naples, the Bank of St. George, at Genoa, and one of the Banks of Bologna. These banks having advanced sums of money at the time of their establishment, did not only agree for a fund of perpetual interest, but were allowed the privilege of keeping cash." And this is precisely the meaning of the word *Bank* in our earliest English writers. Thus, Bacon, says "Let it be no *BANK*, or common stock, but every man be master of his own money," a sentence which is quite unintelligible, if *bank* is derived from *banco*. So also Evelyn (*Diary*, Vol. I., p. 211,) speaks of the "Monte di Pietà, at Padua, where there is a continual *BANK* of money to assist the poor," where it evidently means an accumulation of contributions. And the meaning of Monte di Pietà is simply a charity bank. So also, p. 216, "The great *BANKS* are set up for those who play at basnet," again evidently meaning a heap. So also describing the scandalous scene at Court on the last Sunday evening of Charles II., he says, (*Vol. II.*, p. 210), "A *BANK* of, at least, 2,000 in gold." It is perfectly manifest that in all these places, the word *Bank* is the equivalent of the Italian word *Monte*, and not of *banco*. So also Blackstone confirms this view; he says, (*Vol. I.*, p. 322, *Kerr's Edition*), "At Florence, in 1344, government owed £60,000, and being unable to pay it, formed the principal into an aggregate sum called metaphorically a *Mount* or *Bank*." Thus, we see that there are, at all events, two words from which our word *Bank* may be derived.

5. Let us now inquire what the functions of the first banks were. It is often said that the Bank of Venice dates from 1171. In the sense in which the word is used at the present day, there never was a more complete delusion. The facts were these: In that year the Republic being engaged in a disastrous war, levied a forced loan on its citizens, which was called a *Monte*, and Commissioners were appointed to manage the transfer of stock and the payment of the dividends. Several subsequent loans were contracted. In process of time Venice became the centre of an immense foreign trade, and as a natural consequence, the foreign traders brought a large quantity of coin of all sorts and denominations. These coins, moreover, were greatly clipped, worn, and diminished. This degraded state of the current coin produced

intolerable inconvenience, disorder, and confusion among merchants in paying or receiving payment of their bills. To remedy this it became necessary to have some uniform standard of payment. The plan devised was this: In the year 1587, all the public loans were consolidated into one, and the Commissioners undertook the functions of a Bank of Deposit. Every merchant brought his coins of every different sort to the bank, and they were weighed, and the bank gave him a number of notes exactly corresponding to the real amount of bullion deposited. These notes promised to pay the bearer on demand, a definite quantity of bullion of the proper fineness. Thus they insured a uniform standard of payment, and it was enacted that all bills upon Venice, above a certain amount, should be paid in bank money. Thus this bank merely exchanged notes for bullion, and bullion for notes, and so did not increase the quantity of the currency at all. It was a pure Bank of Deposit. Thus the origin of what we should call the Bank of Venice dates from 1587, and not from 1171. And several writers, such as Law, Voltaire, and Hume, say that the Bank of Sweden dates from an earlier period than this. The money of Sweden was at that time made of copper, and very inconvenient to make payments in, as it required a cart to carry a moderate amount of it. To remedy this a public Bank of Deposit was established, where the merchants deposited their copper money, for which they received bank notes payable to bearer on demand, in which payments were made. Law says that this was the earliest institution of the kind, and that the banks in Italy were subsequent to it. The banks of Amsterdam and Hamburg were for the same general purpose; they received bullion and coin, and gave promissory notes payable to bearer on demand for them. None of these banks did any business on their own account, by way of discounting bills, or making loans. Thus we see that the peculiar function of all these banks, which were pure Banks of Deposit, was to issue promissory notes, payable to bearer on demand, which, however, did not exceed in quantity the bullion they were substituted for.

6. All this time the name of bank and banker was utterly unknown in England. The persons who exchanged money were called money changers, and those who negotiated loans were called *money scrivener*s. During the civil war, however, the goldsmiths in London began to receive deposits from the public, for which they granted receipts which were transferable from party to party, exactly like the notes of the banks we have spoken of, and they began to discount commercial bills by issuing their own promissory notes, payable to bearer on demand; and it was after they began to adopt this practice of issuing promissory notes, and not till then, that they began to be called "bankers," but their places of business were never called *banks*. Thus we see that it was the practice of issuing promissory notes that brought the name of bankers into this country.

7. During the latter half of the 17th century multitudes of projects were started, for the purpose of establishing "Banks," and, on looking at them, we find that they were all for the express purpose of creating promissory notes payable to bearer on demand.

8. Now, we must observe that the goldsmiths who discounted commercial bills by issuing their

own promissory notes, did not confine their issues to the quantity of bullion they held, because they had already given an equivalent amount of deposit receipts for that. But they observed how many of their notes came back upon them for payment, and keeping an amount of bullion sufficient to meet any such expected demand, they could issue as many notes as they pleased. And they derived exactly the same profit from issuing these notes, as if they were gold and silver, and these notes produced exactly the same effects in commerce, as if they were gold and silver. Consequently, in their effects, both to the banker and to the public, just by so much as they exceeded the quantity of the bullion retained to support their credit, and convertibility, they were exactly equivalent to an augmentation of capital—to an equal increase of actual gold and silver. A species of capital, no doubt, of a somewhat dangerous character, and one that was liable to be destroyed, but yet, so long as it did exist, it was equivalent to so much bullion.

9. The first bank actually established in England, was the "Bank of England," which was framed on the model of those banks, which were called *Monti* in Italy. It was a company of subscribers to a public loan, which was the first legal foundation of our National Debt. The sum subscribed by this company was £1,200,000, which was lent to the Government to carry on the war with France, and the company was authorized to create and issue an equal amount of bank notes; they were also authorized to receive deposits from the public, and trade for profit upon their own account.

10. Now, we must specially remark this, that the original capital subscribed by the bank was lent to Government, and was put into circulation, and over and above that, they were allowed to create an equal quantity of bank notes—that is to say, both the coin and the notes were in circulation. Consequently, so far as regards the currency, it is quite clear that the effect of the institution of the Bank of England was to create an addition of £1,200,000 to the previously existing metallic currency. And this result was altogether different from that of the Bank of Venice, where the bullion for which the notes were given was kept in the vaults of the bank, and was not in circulation.

11. Some further augmentations were made to the capital of the bank by fresh loans to Government, and they were on each occasion permitted to create bank notes to an equal amount, and it is quite clear that the notes created on these several occasions were an addition to the previously existing currency. After some time, all restrictions on their amount was removed, and they were allowed to issue as many as they pleased, on the condition that they should be payable to bearer on demand.

12. The next bank erected was the Bank of Scotland, which was the first instance of a mere private Joint Stock Bank. It was an association of private persons, who paid in a certain subscription, and they were allowed to create promissory notes *ad libitum*. They received no deposits from the public for nearly ten years after they were established. We are told by contemporary writers, that, in a short time, their notes in circulation were five times the amount of the subscription

paid in to support their credit, and it is perfectly clear that all excess above the amount of bullion deposited was an addition to the previously existing metallic currency.

13. During this period all the London bankers issued promissory notes payable to bearer on demand, and some to a very large extent. It is stated by contemporary writers, that some had notes to the amount of upwards of a million in circulation.

14. Thus we see that the distinctive function of a bank, and a banker, was to issue notes payable to bearer on demand, which were to circulate as money. *That is, to create paper currency*; in some cases only equal to the amount of bullion they displaced, in others greatly exceeding it. And the meaning of the word to "bank" was to receive deposits of cash, and to give notes payable to bearer on demand, and also to discount bills of exchange with similar notes—in fact, *to create instruments of credit*. Thus, in the very able memoirs upon banking, presented by Law to the Regent Orleans, he says:—"La banque est un crédit général." And that this is the true meaning of the word there is abundant proof.

15. These views are quite borne out by the language of the Statute of 1709, preventing banks of more than six persons being formed. At this period a bank was considered so much an affair of State, that no one thought of a bank not erected by Act of Parliament. And when in 1697 parliament meant to confer a monopoly on the Bank of England, it only said that no other bank should be erected by parliament. But about 1708, some other public companies began to do banking business, by issuing promissory notes, and on the renewal of the charter in 1709, parliament was called upon to interfere to protect the monopoly of the bank of England, and the language of the Act demands our attention. At this time there was no legal definition of the word "bank," and "banking," and, consequently, the Act did not directly enact that no bank with more than six partners should be formed, but it described what was at that time the well understood business of banking, and it prohibited that. The words of the Act are these:—"That during the continuance of the said corporation of the Governor and Company of the Bank of England, it shall not be lawful for any body politic, or corporate whatsoever, erected, or to be erected, (other than the said Governor and Company of the Bank of England), or for any other persons whatsoever united, or to be united in covenants, or partnership, exceeding the number of six persons, in that part of Great Britain called England, to borrow, owe, or take up any sum or sums of money, on their bills, or notes, payable at demand, or at any less time than six months from the borrowing thereof."

16. Thus we see that at this period banking was understood to consist in *borrowing*, or *owing*, or *taking up* money on promissory notes payable to bearer on demand, and to forbid persons to do that was to prevent them from banking. This, then, at that period was the well understood meaning of banking, and for a considerable period this clause was perfectly effectual for its purpose, and it did prevent any other joint stock bank from being formed.

17. But this meaning becomes much more clear in 1742. The act of 1709 did, for some

time, prevent any rival banks from being founded, but about 1740, some persons tried to evade the words of the act, and erect banking institutions. In order to put an effectual stop to this, the language of the act of 1742 is much more full and explicit. It says, "And to prevent any doubt that may arise, concerning the privilege or power given by former Acts of Parliament to the said Governor and Company of **EXCLUSIVE BANKING**; and also in regard to erecting any other bank or banks, by parliament, or restraining other persons from *banking*, during the continuance of the said privilege granted to the Governor and Company of the Bank of England, as before recited; it is hereby further enacted and declared by the authority aforesaid, that it is the true intent and meaning of the Act, that no other bank shall be erected, established, or allowed by parliament, and that it shall not be lawful for any body politic or corporate whatsoever, erected or to be erected, or for any other persons whatsoever, united or to be united, in covenants, or partnership, exceeding the number of six persons, in that part of Great Britain, called England, to *borrow, owe, or take up, any sum or sums of money on their bills, or notes, payable at demand, or at any less time than six months from the borrowing thereof*, during the continuance of such said privilege to the said Governor and Company, who are hereby declared to be and remain a Corporation with the privilege of **EXCLUSIVE BANKING**, as before recited."

18. Hence, we see that the privilege of exclusive banking conferred on the Bank of England, is expressively declared to consist in *borrowing, owing, or taking up money, on bills, or notes, payable on demand*. That is, in creating and issuing currency, and to prohibit persons from creating currency was, in fact, to prohibit them from banking. These words were devised with the utmost care, so as to prevent any other rival in the most comprehensive manner possible. It was supposed that no legal ingenuity could devise an expedient to evade so extensive a prohibition. *The form of words adopted in the Act was devised in reference to the method of doing banking business at the time they were framed*, and they did prevent any other public bank being formed, as long as bankers adhered to that particular method of doing business, that is, as long as they *created currency in the form of promissory notes, payable to bearer on demand*. But, about thirty years later, bankers adopted a change in the method of doing their business so simple, and apparently, so unimportant as to elude notice. And it was this mere change in the *form* of doing their business, that is, of creating liabilities, or currency, in a form not provided for by the words of the Act, that cut away the ground from under the Act, and was the means whereby the present Joint Stock Banks in London were founded, and thus destroyed the monopoly of the Bank of England, because when this mode of evading the Act was discovered, and the Bank applied to parliament to put a stop to it, they were told that such monopolies were out of fashion, and their demand was refused.

19. Before we describe the change that took place in the mode of doing banking business, which was adopted about 1772, it may be as well to exhibit the form which a banker's accounts

would present under the old system. Neglecting any capital of his own the banker might be possessed of, let us suppose him to have £10,000 in cash deposited with him by one set of customers—A, B, C, &c., then his accounts would stand thus:—

Liabilities.

To customers' balances £10,000

Assets.

By cash deposited £10,000

Now, let us suppose that another set of customers, a, b, c, &c., bring him £30,000 of bills of exchange to discount, the way he would have done it, would have been to give his own promissory notes to that amount, deducting the discount. Let us take that at 5 per cent., and the bills at twelve months, for the sake of simplicity. Then his accounts would stand thus—

Liabilities.

To customers' balances £10,000

Notes issued..... 28,500

£38,500

Assets.

By cash deposited £10,000

Bills of Exchange 30,000

£40,000

That is to say, with actual cash to the amount of £10,000, the banker has created liabilities to the amount of £38,500. And, of course, it is perfectly clear that the amount of liabilities he might create, would depend on the actual amount of cash, which experience would show him, would, on an average, be demanded from him. And it is also perfectly clear, that all the notes above that, created and in circulation, would be as profitable to himself, and produce exactly the same effects to the public, as an actual increase of gold and silver.

20. The words of the Act we have quoted, were framed specifically in reference to this particular method of creating currency, or liabilities, and as long as bankers created liabilities in this form only, they effectually prevented any Joint Stock Banks being founded in rivalry to the Bank of England. But about 1772, the London bankers, who all up to that time issued notes to a very large extent, changed their method of doing business. They adopted a different *form* of creating liabilities. Instead of creating liabilities by giving their customers their promissory notes, *they merely wrote down to their credit in their account an equal sum*, and they gave them books containing a number of blank draughts, which the customers might fill up in favour of any one they pleased, and which were also payable to bearer on demand, and which the banker engaged to pay to any one who presented them, provided he had funds of his customers to meet them. And these forms are called **CHEQUES**. Thus, under the old system, a banker used to create liabilities by issuing his own promissory notes payable to bearer on demand; under the new system he creates liabilities by promising to pay a Bill of Exchange, drawn upon him, payable to bearer on demand, to an equal amount.

21. Hence, the modern system of Cheques is

nothing but a substitute for Bank Notes. A bank note is, in fact, a double obligation; one, an obligation to pay the customer, the original creditor, the second, to pay the bearer, *i.e.* any one to whom the original creditor may transfer the obligation. Now, the modern practice separates these obligations, the entry in the banker's books is the obligation to pay the customer, the permission to draw a bill of exchange payable to bearer on demand, called a cheque, is the obligation to pay any one the customer may transfer the debt to. And the entry in the banker's books, together with the cheque, make up the bank note.

22. Hence, we see that although banking originally consisted in issuing notes payable to bearer on demand, yet bankers devised a method of doing the very same thing, under another form, *and we must change the form of expression accordingly, to meet the altered form of doing business.* Nor shall we have the least difficulty in finding an expression which will include both forms. For though the business of banking consisted in discounting bills with their promissory notes, payable to bearer on demand, we may express it thus, *that it consisted in buying debts with PROMISES TO PAY.* And these promises to pay may be of two forms.

I. Promissory notes payable to bearer on demand.

II. Figures written down to the credit of the customers, to be drawn against by cheques, payable to bearer on demand.

The method of doing business by means of cheques, was found to have so many practical advantages over that by way of notes, that from that period London bankers universally discontinued the issue of notes, and adopted cheques; though they never were forbidden to issue notes until the Bank Act of 1844.

23. The modern system of banking, then, by means of cheques, is exactly the same in principle as the former method of bank notes, only it is somewhat varied in form. In each case *banking consists in creating liabilities*, and the modern form of stating these liabilities in banking accounts is a source of an enormous amount of erroneous opinion. In the former mode of stating the accounts, it is open and patent to the world, that the banker has created liabilities against himself by the discount of bills; in the modern form these liabilities are disguised and amalgamated with the actual deposits in cash, so that it is made to appear, and is almost universally believed, that what is classed under deposits in the published banking accounts, are deposits in actual cash, whereas they are nothing but a creation of credit.

24. The reason is this, that in the old form when a banker discounted a bill with his own notes, it was stated that they were his own notes, and a distinction was plainly drawn between liabilities created by the deposit of cash, and the notes issued in the discount of bills. In the modern form, when a banker has created liabilities by discounting a bill by writing down to his customer's credit, what under the old system he would have given him as notes, they are treated and classed as a "balance on drawing accounts," and they are *not* distinguished from the liabilities created by the deposit of cash, and the two being thus presented to the public under one denomination, are almost universally believed to be actual cash, except by

those who are acquainted with the mechanism of banking. In order to present the difference in the clearest manner to the reader, we shall now contrast the two forms of stating the accounts.

OLD FORM OF BANKING ACCOUNTS.

Liabilities.

To customers' balances.....	£10,000
Notes in circulation	28,500
	<u>£38,500</u>

Assets.

By cash deposited	£10,000
By Bills of Exchange	30,000
	<u>£40,000</u>

MODERN FORM OF BANKING ACCOUNTS.

Liabilities.

To customers' balances.....	£38,500
	<u>£38,500</u>

Assets.

By cash deposited	£10,000
By Bills of Exchange	30,000
	<u>£40,000</u>

25. Now, in examining these two forms of accounts, though they are, in reality, only two different methods of doing the same thing, a striking difference is apparent on the face of them. In the first it is manifest on the face of it, that the banker has created £28,500 of notes, or created that amount of liabilities against himself, by buying bills of exchange. In the second form this does not appear at all, but this sum of £28,500 appears as a *deposit*, and to any one who is not conversant with the subject, it seems to be a deposit in actual cash, and many persons are apt to believe that a banker has that amount of cash to trade with. Thus, when the accounts of the great London Joint Stock Banks are published, and it appears that one has £13,000,000, and another has £10,000,000, and so on of deposits, it is almost universally believed that the first has £13,000,000, and the next £10,000,000 of actual money to trade with, or *lend out*, as the erroneous phrase is. And every half year we see summaries in the newspapers, shewing that all the Joint Stock Banks have, perhaps, an aggregate sum of £40,000,000 of money deposited with them, and it is generally believed that they have that sum of money to trade with. But there never was a more complete and entire delusion. These £40,000,000 of "deposits" are not £40,000,000 of cash, *but they represent the old bank note circulation.* They are nothing but an enormous superstructure of CREDIT, built up upon a comparatively small basis of bullion, exactly like the note circulation. These figures do not shew the quantity of cash at their command to lend out or trade with, but they shew the quantity of business they have done, they shew the liabilities they have created. These apparent deposits in cash, then, are nothing whatever, but the credit

created in exchange for the bills which figure on the other side of the account as Assets.

26. These two forms of banking accounts, thus presented in contrast to each other, shew how the accounts would stand just *after* the banker has discounted his customers' bills, and *before* they have begun to operate upon their accounts, in the latter form by means of cheques. Every banker does business in exactly the same way, and when their respective customers begin to operate by means of cheques, the following three different results may ensue :—

1. The actual money may be drawn out.

2. It may be transferred to the account of another customer of the same bank.

3. It may be an order to pay another bank.

But, in the last case, if the banker A is ordered to pay the banker B so much, the chances are that B will be directed to pay A very much the same amount, and then an interchange of these respective orders may take place, and only the differences be paid in cash. And this is exactly the same in effect, as an interchange of bank notes.

27. Thus, we see that the modern system may be expressed in exactly the same language as the old one. Banking formerly consisted in the creation and exchange of instruments of credit. And so it is now. Banking now equally consists in the creation and exchange of instruments of credit, just as much as it ever was. The only difference is, that the form of the instrument is changed, and it was by this change in the form of the instrument, that the London Joint Stock Banks were able to be founded, because the words of the monopoly clauses of the bank acts of 1709, and 1742, only specified the former method of creating these instruments of credit.

28. Now, under the former system, it was universally allowed that banks, by creating credit in the form of notes, created currency; under the modern system entries and cheques perform exactly the same functions as notes, consequently, in a scientific sense, they are to be considered as currency, just as much as notes are, and consequently, banks create currency now just as much as they did before, and the supposition that the legislature can prevent banks from dealing in credit, by prohibiting the issue of bank notes, is a mere delusion. But, at the same time, it must be fully admitted that bank notes may produce a greater inflation of credit than cheques, because there are many cases where bank notes would pass, that cheques will not pass, but wherever they do pass they are to be considered, in all respects, as the equivalents and substitutes for notes.

29. These considerations afford an explanation of some very well known phenomena, which are generally misunderstood, respecting the Joint Stock Banks, which publish their accounts, and give interest on deposits, according to the rate of discount. When the rate of discount rises very high, it is universally observed that the apparent deposits in banks decline, and it is very commonly explained by saying, that when interest rises very high, people take their money out of banks, to invest it in other ways. But such an explanation is paradoxical on the face of it. Banks raise the rate of interest to attract deposits, and not to drive them away. Besides, if

one asks contractors, builders, &c., at such periods, they will say, that work is stopped because people put their money into banks, because the interest is so high. Thus, we meet with two diametrically contrary assertions as to the flow of money at such periods; but, if we understand the real nature of these so-called deposits, the reason of their diminution is plain; because, when the rate of discount is raised very high, it stops the discount of bills, it stops the creation of credit, in fact, *it is not a diminution of deposits in cash, BUT IT IS A CONTRACTION OF CREDIT.*

30. The very same phenomenon is witnessed after a great commercial crisis, such as that of 1857. In July, 1858, the aggregate of the sums deposited with the Joint Stock Banks, appeared to be considerably less than in July, 1857; and this was, in fact, owing to the diminished number of bills discounted from the general contraction of mercantile operations, and by no means necessarily to a diminution in the actual cash deposited.

31. Now, it is generally admitted, that issuing notes is coining credit, that it is, in fact, to all intents and purposes, equivalent to creating capital, both as regards the issuers of the notes, and their effects to the public, a species of capital which is liable to be destroyed, and is capable of very serious abuse. But it also necessarily follows, from the preceding details, that the modern system of banking is equally coining credit, and that just as much as the figures, or the liabilities created, exceed the actual cash, they are equivalent to a creation of currency, or to an increase of capital.

32. We may now here notice an objection which is fully discussed under the term *Currency*, but which is so intimately connected with banking, that we must repeat it. Many persons say that bills of exchange are not currency, because they require to be discharged in money, and many more think that bills of exchange are analogous to bills of lading, because one *represents*, as they erroneously call it, money, and the other represents commodities. It is perfectly true that all bills of exchange must be expressed to be payable in money, but it is a most grievous mistake to suppose that they are all paid in money. The immense majority of commercial bills are not paid in money, but by figures in bankers' books. Most men in commerce draw bills and accept bills, that is, they have debts due to them, and debts due by them. These fall due at different dates, and when a trader's acceptances are falling due, he takes some of the debts due to him to his banker, and sells them to him. The banker buys them, as we have already explained, by creating fresh liabilities of his own, and writing down so many figures to his customer's credit. When his own acceptance falls due, and is presented to him for payment, he draws a cheque upon his banker, and if the holder of the bill is a customer of the same banker, the matter is settled by a mere transfer of figures in the banker's books; if he is the customer of another banker, the two bankers have probably an exchange of debts, arising out of similar transactions on both their parts, and the debts are settled with the payment of no more coin than the difference; or if, as is more usually the case, the holder of the bill has deposited it with his

banker, and the acceptor has made it payable at his own banker's, who pays it as a matter of course, as an ordinary cheque, the day it is due. Thus we see that the whole monetary business of the country is gradually reduced to the *creation and exchange of instruments of credit*, and the only use of the actual money is to pay the differences. Now, this is the regular practice of banking; this is the way in which the vast majority of bills of exchange in commerce are paid, and consequently the whole system may go on for an indefinite time, and to an indefinite extent, without a single coin being required. Thus, a merchant may carry on trade for any length of time, and pay bills to the amount of millions of money, and never touch a single coin. But these instruments of credit perform exactly the same functions as if they were coin, and in a scientific point of view, they are to be considered in all respects as if they were coins. They are all a part of the currency, or circulating medium.

33. Bank notes and cheques are, therefore, peculiarly the instruments of credit, created by Banking, as bills of exchange are by commerce. The only practical difference between them is, that the former are, on the face of them, direct obligations of the banker to pay the money stipulated; the latter are not so, unless he has sufficient funds of his customer to meet them. The consequence is, that when cheques are transferred from hand to hand, it is usual to require the transferer to indorse them, so that if the banker refuses to pay them, the liability of the transferer may be preserved. In Bank notes this is not usually done, because as the holder may demand payment for them on the instant from the bank, few persons expect that it will fail before payment is demanded, and consequently Bank notes usually pass from hand to hand by simple delivery, without indorsement.

34. Both Bank notes and cheques are subject to the general rule of law, which affects all instruments of credit, that whoever takes one in payment of a debt *without indorsement*, does so at his own peril, and has no remedy against the transferer, if it is not paid. And the indorsement only preserves the liability for a very short period; in almost all cases not more than twenty-four hours. The law intends that all Bank notes and cheques should be presented for payment within twenty-four hours. If the receiver of a Bank note requires the transferer to indorse it, which is by no means unfrequently done, and if on presenting it within a reasonable time he finds the banker has failed, he has his remedy against the transferer, just exactly as if it was a cheque. On the other hand, if he delays presenting it beyond a reasonable time, and then finds the banker has failed, he has no remedy against the transferer, either in the case of an indorsed Bank note or a cheque.

35. We have shown (CREDIT) that a merchant deals with credit: it follows by the preceding considerations that a banker is a *dealer in credit*. A merchant brings him debts payable some time after date, for sale, and by a flourish of his pen the banker transmutes these into debts payable instantly, which have precisely the same effect in commerce as so many sovereigns. He reaps exactly the same profit by creating a credit in favour of his customer, as if he gave him the

actual cash. And the cheques drawn against these credits, so created by the banker, circulate commodities exactly in the same manner as Bank notes do, which circulate commodities exactly in the same manner that gold and silver money does; consequently these credits so created by the banker are CURRENCY, or CIRCULATING MEDIUM, and hence it manifestly follows that BANKING CREDIT IS BANKING CAPITAL.

36. But the preceding details by no means exhibit to their full extent the amazing powers of Banking in commerce. We have given them merely to show the general meaning of the word Banking. We shall now endeavour to exhibit some of the practical effects of the introduction of Banking into a country where it did not previously exist, which is the true way to form a real estimate of its powers, and its advantages to the community.

37. Before the introduction, then, of Banking every merchant had bills to pay, or acceptances to meet, and he had also bills to receive. For those he had to pay, he must have kept the amount in actual money; and for those he had to receive, he must have kept at least one (perhaps a merchant in large business must have kept more than one) clerk, for the special duty of collecting his bills. Moreover, if he made any mistake, the loss would fall on himself. Now, he leaves all his spare cash at his banker's, and makes his acceptances payable there; and besides that, he sends all the bills which are due to him to his banker, who collects them for him, and if any mistake occurs the loss falls upon the banker, and not upon him. Moreover, when his own acceptances fall due, he does not, as we have seen, require to have any actual money at all to pay them with. As they become due he discounts fresh bills with his banker, who creates a credit in his favour by writing down so many figures to his account, and thus his acceptances are paid, *not in money, but by means of the credit created by the Banker*. Thus we see that the Banker multiplies the paying medium of the country.

38. Now the slightest reflection will show any one the enormous saving of money that is effected by this means. It is actually found in practice, that it saves about *nine-tenths* of the actual specie that would be necessary to carry on any given amount of business without it. Now, let us suppose, that a country required £1,000,000 in specie to carry on any amount of business, and let us suppose that by means of the introduction of banking, it was able to dispense with £900,000 of this; that is to say, that amount of specie might be displaced, and instruments of credit substituted for them. Then it is quite clear that these £900,000 in instruments of credit, which performed the same functions as the same amount of money, are to be considered in all respects as equivalent to that amount of money; that they are equally *currency, or circulating medium*, as the money itself. And consequently £900,000 of specie being disengaged from its functions, is capable of being applied as *additional capital*, and is in fact equivalent to so much increased capital. Hence, we see, that the introduction of banking, is a *bonâ-fide augmentation of capital*. For we unhesitatingly assert this proposition, *that if an instrument of credit performs exactly the same functions as money, it is, in a scientific sense, to be*

considered as money. Hence we arrive at this conclusion, that by the introduction of banking the same amount of business may be carried on with *one-tenth* of the quantity of money, that would be required without it, or else supposing that the same amount of actual specie is retained, the quantity of business that may be carried on with it may be *multiplied* **TENFOLD**.

39. Thus we see how the prodigious stimulus which is always practically felt on the introduction of banking, is explained. The preceding details show the enormous error of those who think that banking does not add to capital, that it only distributes existing capital. It is unquestionably true, that no mode of banking can create actual gold sovereigns. But banking *creates* instruments of credit, and if these be voluntarily received and accepted by the community at large, at exactly the same value as if they were actual sovereigns, then just by so much as they exceed in number the quantity of actual sovereigns in the banker's possession, they are to all intents and purposes, an addition to existing capital. For not only does he save the use of the actual coin in an immense multitude of instances, where it would be required, if Banking did not exist, and liberates it, and enables it to be applied to promote commerce, which is in its practical effects identical with an addition of actual coin to that extent, but by the extra multiplication of his promises to pay over and above that, he is enabled to make what is to all intents and purposes a further addition to the moving power of commerce, to an enormous extent.

40. Banking is, therefore, the most potent engine for increasing the motive power of any given quantity of actual capital, that it is possible to devise, consistently with keeping up the value of the currency at its level with bullion. John Law says most justly, "The introduction of credit, by means of a Bank, augments the quantity of money more in one year, than a prosperous commerce could do in ten." And just as Banking spreads more extensively does it multiply the producing power of the community. We have shown the great economising power of railroads (RAILROAD) in diminishing the quantity of capital required to supply any given demand for commodities; now, an extension of banking acts precisely in an analogous manner, but to a much greater degree; for not only does it economize the actual substance to a very great extent, but it makes the "promise to pay" of equivalent value with the actual payment. And it is just in this multiplying power of capital that the principal danger of too rapid an extension of Banking consists. The rate of discount always depends upon the proportion between actual capital and the demand for it, or on the debts offered for sale. A sudden change in the proportion of these causes the most violent fluctuations in the rate of discount. If an unusual quantity of capital is thrown too suddenly upon the market, the only result must be a rapid and extreme fall in the rate of discount. Now a too rapid extension of Banking, has precisely the same effects as throwing a vast quantity of capital suddenly on the market. For not only do the actual operations of Banking have all the practical effects of adding to the existing capital, but to that will be added all the evil effects of over competition, an unnatu-

rally low rate of discount, thereby a depreciation of the currency; an export of bullion, a joint stock bubble mania, with all its rogueries, then a collapse, and commercial ruin.

41. We see, too, by the preceding details, the prodigious error of the common description of the business of banking. For it is almost universally considered that *bankers are merely agents between persons who want to lend and those who want to borrow*. Of all the fallacies that beset Political Economy at the present day this is one of the most mischievous and pestilent. It is a striking example of Bacon's *idola fori*, or fallacies of language. It is an entire misconception of the nature and effects of banking, and no sound progress can be made in Political Economy, until it is entirely extirpated from the subject. It is a misappreciation of the nature of banking, and is not true, in the ordinary sense of the words, lending and borrowing; because, in the ordinary cases of lending and borrowing, the lender deprives himself of the use of the capital he lends. But, in ordinary banking, both parties have the complete right to make use of the very same coin. The customer lends his money to his banker, and yet has the same free use of it, as if it was in his own chest—the banker employs that money in promoting trade; upon the strength of its being deposited with him, he buys debts with his "promises to pay," and the person who sells the debt has the free use of the very coin, which the lender has the same right to demand.

42. And it is just in this very point, that the distinction between a *banker* and a *bill broker* consists. A bill broker buys bills of exchange with actual cash, and therefore the quantity he buys can never exceed the quantity of cash he has. On the other hand, a banker always buys bills with his promise to pay cash; consequently, the only limit he need impose upon his business is that which his own judgment may suggest to him, to keep in a condition to meet any demands that may be made to him.

43. We must also correct a most inaccurate notion, which is almost universally prevalent, as to the nature of banking. The common notion of banking is, that it consists in *lending* money on the security of Bills of Exchange. Such an idea, however, is profoundly erroneous, it is a complete misconception of the nature of the business. When a banker discounts a bill for his customer, he does not lend him money on the security of the bills, but he *buys a debt that is due to him*. If he *lent* his customer money, it would be the customer's duty to repay the money, when the bill became due. But every one knows it is the acceptor's duty to pay the bill, and the customer's name on it is merely a *warranty of soundness*, as it were, of the debt; and, it is only in the event of the acceptor not paying the bill, that the customer is liable. If the banker did not think the debt a good one he would not buy it, and when the customer has sold it to his banker, he never expects to hear of it again. Now, many persons admit that, if a man transfers a bill *without indorsement*, that is, a *sale* of the bill, and not a mere loan of money, but when the transferer indorses it, they say that alters the nature of the transaction, because, if the bill is not paid by the acceptor, he is still liable. But, the least reflec-

tion will shew that this distinction is utterly untenable; because, in the first place, it is only a *contingent liability*, and not an actual liability, until payment is demanded. The real difference between selling a bill, with or without indorsement, is exactly analogous to that of selling a horse with or without a limited *warranty of soundness*. If a man buys a horse without a warranty, there is an end of the transaction. If he takes a warranty with it, it is usually limited to a certain time. If the horse is sound, well and good, the transaction is finished; but if the buyer finds out a blemish, and gives notice to the seller *within the agreed upon time*, he returns the horse, and gets back his money. But though the liability of the seller of the horse continues during the currency of the warrant, it is no *debt* until the price be demanded back again. It is exactly the same with a debt. The debt is an article of commerce just like the horse, and the indorsement is, in its nature, a warranty of its soundness; and, like most warranties, very strictly limited in its duration, because it only lasts for a very short time after the debt is known to be bad, (*INDORSEMENT*), in most cases, only twenty-four hours. If the holder of the bill neglect to demand payment within that time from the indorser, his remedy is gone, and the indorser is discharged, exactly as in the case of an ordinary warranty. To say, therefore, that a banker *lends* money to his customer upon the security of the bills, is just as irrational as to say that the buyer of a horse lends money to the seller, on the security of the horse. The true description of the ordinary business of a banker is, that he buys debts with warranty of soundness, with his "promises to pay."

44. The preceding details also shew the entire fallacy of the almost universal opinion that the London Banks, public and private, other than the Bank of England, are mere Banks of Deposit, and are not Banks of Issue. Thus, Mr. McCulloch says, (*Dictionary of Commerce, Art. Bank*.) "Banks are commonly divided into the two great classes of *Banks of Deposit*, and *Banks of Issue*. This, however, appears, at first sight, to be rather an imperfect classification, inasmuch as almost all Banks of Deposit are, at the same time, Banks of Issue, and almost all Banks of Issue are also Banks of Deposit. But, there is, in reality, no ambiguity; for, by Banks of Deposit are meant Banks for the custody and employment of the money deposited with them, or intrusted to their care by their customers, or by the public; while, by Banks of Issue, are meant Banks which, besides employing or issuing the money intrusted to them by others, issue money of their own, or notes payable on demand. The Bank of England is our principal Bank of Issue, but it, as well as the other Banks in the different parts of the empire, that issue notes, is also a great Bank of Deposit. *The private Banking Companies of London, and the various Provincial Banks that do not issue notes of their own, are STRICTLY BANKS OF DEPOSIT.*" We have no hesitation in affirming that this last paragraph is an entire misconception, because the plain meaning of it is, that the private Banking Companies of London do not *create credit*, whereas, we have shewn that the *business of Banking consists in creating credit*. The Banks of Venice, Amsterdam, and Hamburg, are what we

consider the pure types of Banks of Deposit, because the notes they issued only represented an equal quantity of bullion, and they did not *add* to the quantity of the currency. Whereas *all* the London Banking Companies *add* to the circulating medium, and, therefore, they are all to be considered, in a scientific sense, as *BANKS OF ISSUE*.

45. We thus see how entirely fallacious is the classification of Banks, as Banks of Deposit, and Banks of Issue, according as they issue Bank notes or not. Because the Banks of Venice, Sweden, Amsterdam, and Hamburg, which were pure Banks of Deposit, all issued notes; and the London Banking Companies, which, in a scientific sense, are *all banks of issue*, do not issue notes. The true criterion of whether a Bank is one of Deposit or Issue, is to be found, in our opinion, in the circumstance whether it does, or does not, multiply instruments of credit. That is, whether it does or does not *create instruments of credit exceeding the quantity of bullion it has in deposit to represent them*.

46. To show how completely at fault even the most eminent writers are on the nature and effects of Banking, we shall quote an extract from Mr. J. S. Mill (*Principles of Political Economy, Book III., Chap. 24, § 3*). In treating of the *regulation of a currency*, and the effects of the Bank Act of 1844, he says in a note, "It would not be to the purpose to say, by way of objection, that the obstacle may be evaded by granting the increased advance in book credits, to be drawn against by cheques, without the aid of Bank notes. This is indeed possible, as Mr. Fullarton has remarked, and as I have myself said in a former chapter. *BUT THIS SUBSTITUTE FOR BANK NOTE CURRENCY CERTAINLY HAS NOT YET BEEN ORGANIZED; and the law having clearly manifested its intention that in the case supposed increased credits should not be granted, it is yet a problem whether the law would not reach what might be regarded as an evasion of its prohibitions, or whether deference to the law would not produce (as it has hitherto done), on the part of Banking establishments, conformity to its spirit and purpose, as well as to its mere letter.*" We have seen in the preceding sections that what Mr. Mill says has not yet been organized, and which the law might possibly put down, is the *very thing in which London Banking has consisted for upwards of seventy years!*

47. Moreover, the Bank Act of 1844 was for the express purpose of preventing Banks from creating credit; and the almost universal opinion is that it does so—that it makes the currency vary in amount exactly as it would do if it were purely metallic. The preceding details show that the ordinary business of London Bankers consists in the daily creation of *millions of promises to pay*. And we have no hesitation in affirming that the popular belief that the Bank Act of 1844 prevents Bankers from creating credit, is, since the belief in the Balance of Trade, beyond all comparison the *MOST PROFOUND DELUSION THAT EVER DECEIVED THE PUBLIC MIND*.

48. Thus, too, a distinction which is very strongly insisted upon by an influential class of persons at the present day, is shown to be utterly fallacious. For they draw a strong distinction between "Banking" principles and "Currency" principles, maintaining that bankers have no

business to create currency, but that their simple functions are to lend out the money deposited with them by their customers. And they hug the fond idea that the Bank Act has enforced this distinction, which we have shown is a pure delusion.

49. To show the enormous practical benefits that may be produced by Banking, even by a bad system, we have only to adduce its effects in England, in the second half of the last century. Burke says that when he came to London there were not twelve bankers out of London. But in 1769, the first patent for the steam-engine was taken out by James Watt, and the spinning jenny was invented, and soon after that the country woke up from its lethargy, and commenced those great engineering works, which have so pre-eminently distinguished it from that day to this. Now, to carry out these works an enormous amount of capital in the form of money was absolutely requisite, but it would have taken a long time to accumulate this necessary quantity, and it would have required an enormous expense, because the necessary quantity of gold and silver could only have been acquired by the exportation of an equal quantity of manufactures. But this was the case—an innumerable quantity of bankers started up in all directions, who created their promissory notes, which circulated exactly as actual money did, and performed exactly the same functions as money did, and by these means these great works were carried out. Now, it is no doubt true that the monopoly of the Bank of England prevented large and powerful banking companies being formed, which would have supplied a solid currency, and that a very great number of these “bankers” were merely petty tradesmen, who were quite unfit to perform the functions they had assumed, but yet it is an undeniable truth, that the notes they issued, however bad they ultimately were, so long as they actually did circulate, were circulating medium, and they produced the same effects as gold and silver, and they were *capital*. A bad and dangerous species it is true, but yet capital. And it was by means of them, that that prodigious industrial activity was maintained. And this well exemplifies the error of those who think that Bank notes are not capital, because, say they, that if one of the public hold one of the banker's notes, the banker owes it, and thus the debt and the credit being equal, the result is *nil*. But that is not the true mode of viewing the question. It is perfectly true, that if payment be demanded for the note, the banker must pay it, and the note is extinguished. But that is not the way to look at the question. Until payment is demanded, the banker's liability is only *contingent*. Now, by issuing his notes, he creates products, which have exchangeable relations with other things. A bank note, therefore, until payment is demanded for it, circulates as an independent economic entity, just like money. And, therefore, when a banker can maintain a greater amount of his notes in circulation than he keeps money on deposit, he *creates* exchangeable products, which may be used exactly as money, and are therefore capital. No doubt the area they circulate in is much smaller than the area money circulates in, but yet within that area, however small it may be, they are equivalent to money.

50. A most important function which Banks perform is that of rapidly transferring capital from one branch of business to another, and from one part of the country, where it is superabundant, to another part, where it is deficient. As the whole machinery of commerce is carried on by means of credit, if one branch of business falls off, the bills in that branch will diminish, and if another branch is developing itself rapidly, bills in that branch will increase. Now, if there were no bankers, persons who had bills to sell might have much difficulty and trouble in finding persons to buy them, and the development of industry would be stunted. But, by means of Banking, they merely sell more bills to their banker, and if he has more money at his command from other business falling off, he immediately transfers capital from one to the other. Moreover, capital has always a tendency to accumulate in agricultural districts, and to be deficient in commercial districts. In the olden time, before the institution of bankers, people in the country used to bury their cash in the ground, or in secret recesses of their houses, where it lay unproductive. Now it is collected by country bankers, and remitted to the seats of commerce, where there is a constant demand for it. In Scotland, where Banking has been free for a long period, the great Banks have branches both in the agricultural and in the commercial districts. The agricultural branches remit the surplus cash of their districts to the head office in the metropolis, which sends it down to the commercial districts. In England, until comparatively recent times, this was not possible, because, until 1834, there were no Joint Stock Banks in London, consequently each separate country banker remitted the surplus from his own neighbourhood, and lodged it in some way in London, in a great many cases with the great bill-brokers at call. But the commercial districts equally felt the want of capital, consequently the bankers in those districts remitted the bills they had already bought from their customers, and sold them to the London bill-brokers, and hence arose that system of rediscounting which has been so much condemned. It is the only way of getting over the impediment created by the monopoly of the Bank of England to the transfer of capital from the agricultural to the manufacturing districts.

51. The preceding details will, we hope, give an adequate idea of the enormous importance of the Banking system in the economy of the country. It is, in fact, the heart of the whole commercial body. It attracts to itself capital, the life-blood of commerce, in the minutest rills, from every direction, and having accumulated it in a great reservoir, propels it through all the arteries and channels of commerce, vivifying and nourishing it, and spreading vigour and health through the whole commercial body.

52. Banking is now of such transcendent importance in modern society, and its ramifications are so spread through all classes of the community, that a convulsion in the Banking system spreads terror and desolation throughout the whole community. An accurate knowledge of the history and principles of Banking is of surpassing consequence to all Political Economists; we shall, therefore, lay before our readers an historical account of the chief events in the his-

tory of Banking in the most important countries. In such a matter as this, it makes very little consequence which we begin with, and we shall therefore begin with that of England.

Historical Sketch of the Rise and Progress of Banking in England.

53. Banking, in the modern sense of the word, had no existence in England before the year 1640. The exchanging of foreign money for that of the country, which was the business from which Banking sprang, was a royal monopoly. Persons who negotiated loans of money were called *money scriveners*. The Mint in the Tower had in some sense performed functions of a Bank of Deposit, for merchants, both native and foreign, had been in the habit for a considerable time of depositing in it their cash and bullion for the sake of security, under the guardianship of the Crown. But in 1640, King Charles I. being in great straits for money, as he had quarrelled with, and dissolved Parliament, before it had granted any supplies, by the advice of the Lord High Treasurer, Cottington, suddenly seized upon the merchants' cash and bullion to the amount of £120,000. The merchants immediately remonstrated warmly with the Council upon this breach of faith, and finally allowed the King to have £40,000 upon receiving security for its repayment with interest. This money, both principal and interest, was ultimately repaid to them, but the prestige of the royal honor was gone, the Mint lost its credit, and the merchants were obliged to keep their cash at home, under the care of their own clerks and apprentices.

54. Many of these, however, went off with their masters' cash to join the army. Others lent it out to the goldsmiths clandestinely, at interest at 4d. per cent. per diem, which they kept to themselves. The goldsmiths then began to lend out at interest the money lodged with them, and they began to receive deposits from the public generally, offering interest, and allowing the depositors to have repayment whenever they pleased, giving receipts for the money left with them, which were transferable by indorsement. Moreover, they began to discount merchants' bills with their own promissory notes, payable to bearer on demand, which were then called *goldsmiths' notes*. People found it much more convenient to leave their money with the goldsmiths, where they could have it whenever they pleased, along with the interest, than to lend it out on real or personal security. The goldsmiths soon received the rents of all the gentlemen's estates, which were transmitted to town. Five or six stood pre-eminent above their brethren, and Clarendon (*Continuation of Life*, p. 1166,) says, that they were men known to be so rich, and of so good reputation, that all the money of the kingdom would be trusted or deposited in their hands. *And they then first came to be called BANKERS.*

55. This new business, taken up by the goldsmiths, was found to be of great service to the Protector's government. Cromwell was always kept in monetary difficulties by the jealousy of his Parliaments. And the "bankers" were found to be very useful in advancing money in anticipation of the supplies. By this means they became almost necessary to the government. Nor did the government of Charles II. find them

less useful. The first care of the restored monarch was to disband the terrible republican armies, but they required to be paid off, and to do that, it was necessary to collect several hundred thousand pounds in a few days. The slow receipts of the taxes were quite inadequate to effect this, and the ministers were compelled to have recourse to the "bankers," and they were so well satisfied with their proceedings, that they declared the King's government could not be carried on without them.

56. Their method of doing business with the Crown was as follows. As soon as the supplies were granted, they were sent for to attend the king. He always treated with them in person, and showed them the greatest politeness. Having previously consulted with his ministers as to what immediate sums were required, he informed them what ready money was necessary by such a day. They were asked how much they could lend, and what security they would require. Each answered according to his several ability, for there was no joint-stock amongst them; one perhaps £100,000, another more, another less. When asked what remuneration they required, they at first named 8 per cent., which the king and his ministers were quite ready to give, but upon further consideration they determined to leave it to the king's own bounty, lest it might afterwards be turned to their disadvantage, mentioning, at the same time, that they themselves paid 6 per cent. for it to their customers, which was known to be true.

57. They then received an assignment for the payment of the first money that came in, under the Act of Parliament, or tallies upon such other branches of the revenue as were least charged. But even this was no security, as the king and treasurer might divert these payments to other purposes. "Therefore," says Clarendon, "there was nothing surer than that it was nothing but the unquestionable confidence in the king's justice, and the treasurer's honour and integrity, which was the true foundation of that credit, which supplied the necessities of the government. The king always treated them very graciously, as his very good servants, and all his ministers looked upon them as very honest men." We shall shortly see how their confidence in the king's honour was repaid.

58. In 1667 the first run upon the bankers took place. During the few years since the king had been restored, he had brought the country down from the highest eminence it had ever attained to in the affairs of Europe, to such a state of degradation, that it was not able to protect its own shores from the ravages of the enemy. The Dutch being wantonly provoked into a most flagitious war, burned Sheerness and Chatham, and even sailed up the river as high as Tilbury, and the good citizens of London heard for the first, and we fervently hope, the last time, the sound of hostile guns. The most ridiculous despair and consternation took possession of the people of London. "The alarm was so great," says Evelyn (*Diary*, Vol. II., p. 24), "that it put both country and city into fear, a panic, and consternation, such as I hope I shall never see more; everybody was flying, none knew why, or whither." The king alone, who never wanted personal courage, and the Duke of York, kept

their composure, and put to shame the cowardice of a general officer, who thought himself one of the greatest soldiers of Europe, who declared the Tower not to be tenable, and refused to defend it. Every one rushed in a panic to demand his money from the bankers. It was known that they had lent it to the king, and the people believed that the regular payments out of the exchequer could not be made. To quiet the public alarm, the king on the 18th June issued a proclamation to say that the payments of the exchequer would continue as usual, and stating that it was his steadfast resolution to preserve inviolable to all his creditors, all the securities and assignments made for repayment of their advances; that he would not, upon any occasion whatever, permit any alteration or interruption of these securities. He, moreover, said that he held this resolution firm and sacred in all future assignments and securities to be granted by him, upon any other advance of money for his service, by any persons on any future occasion.

59. The enormous benefits which had been conferred on the commerce of foreign countries, by the institution of Banks, had not escaped the observation of our merchants. One of them, Samuel Lamb, says Lawson, (*History of Banking*, p. 192), presented an humble address to his Highness the Lord Protector, wherein he described the great advantages the Hollanders derived from Banks, and the disadvantages England laboured under from their want. (LAMB, SAMUEL). In 1658, Lamb petitioned the House of Commons on the subject of his Bank, and a committee was appointed to consider it, but no record exists of the result. More than one project of a similar nature was brought forward, but with an equally fruitless result. Nor did these schemes diminish after the restoration. Soon after that event multitudes of such projects were started, and very warmly engaged the public attention, and were very generally discussed. But there was one fatal objection to them. The memory of the seizure of the merchants' money by Charles I., made people doubt that a Bank could be safely established under a Monarchy. The subject of Banks was discussed in a little excursion made by Pepys and a party, in 1666. He says, (*Diary*, 17th Aug., 1666),—"Sir Richard Ford did, very understandingly, methought, give us an account of the original of the Hollands Bank, and the nature of it, and how they do never give any interest at all to any person that brings in their money—though, what is brought in upon the public faith, interest is given by the State for. The unsafe condition of a Bank under a Monarch, and the little safety to a Monarch to have any, or Corporation alone, as London in answer to Amsterdam, to have so great a wealth or credit, it is, that makes it hard to have a Bank here. And, as to the former, he did tell us, *how it sticks in the memory of most merchants*, how the late king, when, by the war between Holland and France and Spain, all the bullion of Spain was brought hither, one-third of it to be coined, and, indeed, it was found advantageous to the merchant to coin most of it, was persuaded in a strait, by my Lord Cottington, to seize upon the money in the Tower; which, though in a few days the merchants concerned did prevail to get it released, yet the thing will never be forgot." And,

Sir William Temple says, in speaking of an event which we shall shortly notice "For credit is gained by custom, and seldom recovers a stain. I have heard a great example given of this that happened upon the late King Charles I., seizing £200,000 in the Mint, which had then the credit of a Bank, and for several years had been the treasury of all the vast payments transmitted from Spain and Flanders; but, after this invasion of it—although the king paid back the money in a few months, *the Mint has never since recovered its credit among foreign merchants.*" An event soon afterwards occurred which was not only rendered any project of a Bank hopeless, during the Stuart dynasty, but utterly destroyed the private bankers, who had rendered such essential service to the government.

60. Charles II. had been restored amid the frantic enthusiasm of the people, who had, of course, returned a Parliament which reflected these feelings, and made the most ample provision for his expenses. But, nothing could fill the yawning gulf of his extravagance, and the boundless rapacity of the thieves and plunderers who formed his court. At length, in 1671, his resources were utterly exhausted, and the infamous pension he received from France was utterly inadequate to maintain the naval forces he was bound to keep up. His atrocious proceedings regarding the Dutch, made him afraid to meet his Parliament, who were now in a very different mood to what they were ten years before. In this extremity the king declared that the staff of the treasurer should reward the ingenuity of the man, who should discover some method of relief. Shaftesbury is said to have the merit of originating the idea, but Clifford reaped the profit and the honor. The expedient hit upon was to seize the bankers' money in the Exchequer.

61. It appears that though the perfidy of Charles I. had destroyed the confidence of the merchants in the faith of the king, the bankers had been won over by his long apparent good faith, and gracious treatment of them, and they deposited their surplus cash in the Exchequer, in anticipation, no doubt, of the loans that would be required of them. The king was so delighted with the peculiar perfidy of the transaction, that to the promised reward of the treasurer's staff he superadded an ignominious peerage. On the second of January, 1672, appeared a proclamation, stating that the payments out of the Exchequer would be suspended for a year, but interest at the rate of 6 per cent. was promised. The king by this measure seized £1,328,526; of this sum £416,725 belonged to Sir Robert Vyner alone.

62. The bankers, it is true, were not many, but the money they had belonged in great part to their customers, and these were 10,000. This *coup de finance* was so skilfully done, that no one, except one or two of the most intimate friends of the conspirators, had the slightest warning. The consternation was dreadful in the city. Numberless merchants were ruined. The distress was felt through all ranks of society. Widows and orphans, who had no other means of investment, had lent their all to the bankers. Many persons went mad, many died of a broken heart, many destroyed themselves. It was at first promised that the suspension should only be for a year;

but year after year passed away, and neither the principal nor the interest was paid. But the intensity of the public suffering was too great, and the public indignation was too fierce to be neglected. At length, in April, 1676, the king was obliged to order the accounts of the creditors to be examined by the Chancellor of the Exchequer. This having been done, in April, 1677, the king issued letters patent, granting to each of the goldsmiths, their heirs and assigns, and for the benefit of their creditors, in lieu and satisfaction of their debts, a yearly rent, part of the hereditary excise, equal to 6 per cent. upon the debt, with a clause of redemption, upon the king paying the principal and arrears of interest. These letters were printed and made public on the 23rd of May, 1677, and a bill to ratify them was passed by the House of Lords, on the 10th of July, 1678, but unfortunately was not presented to the Commons before the end of the session, and never became law.

63. The interest continued to be paid till Lady-day, 1683, when it ceased, the royalist party having gained the undisputed ascendancy. None was paid during the reign of James II. At length, in 1689, in the reign of William III., the creditors, being worn out with despair, determined to petition the Court of Exchequer, to make an order for payment of their claims. The Crown determined to resist payment, and the litigation was protracted through eleven years, until at length the House of Lords, on the 23rd of January, 1700, gave final judgment in their favour, establishing their right to the principal and all arrears of interest. *But they were never paid one farthing of it.* An Act was passed in 1700, that after the 26th of December, 1701, the hereditary excise should be charged with interest at the rate of 3 per cent. on the principal, until payment was made of *one half* of the debt! Thus ended this monstrous iniquity. The principal never was repaid, but was afterwards consolidated with the South Sea Annuities, and still forms part of the National Debt. It has been calculated that the loss to the bankers and their creditors, from arrears of interest and retention of the principal, was nearly £3,000,000, to say nothing of the frightful expenses of such protracted litigation.

64. These proceedings utterly ruined, as may be imagined, the credit of the Exchequer of Charles II. No such thing as a public bank could be thought of for an instant, with such an unscrupulous man on the throne. Nevertheless, many schemes for the purpose were published (LEWIS, MURRAY) but as they came to nothing, we need not be delayed by further notice of them, except one. The corporation of London, it appears, had been invested from an early period with the guardianship of all orphan children of freemen, while under age and unmarried, and with their property, which was managed by a Court of Orphans. By this means a large amount of property accumulated in their hands, called the "orphan's fund," which they had been so imprudent as to lend to Charles I. and Charles II. This property, of course, was swallowed up by the rapacity of the latter monarch, but the Corporation was accountable for it. In this dilemma, they tried to get up a Bank, and the proposals were drawn up and

made public, by advertisements setting forth the great benefits to trade by the establishment of Banks of credit, in a printed paper, called "England's Interest, or the great benefit to trade by Banks, or Offices of Credit, in London." The proposal, however, did not meet with public favor, and the plan failed, and the orphans' property was afterwards made good by other means.

65. One institution, however, for a short time did succeed in establishing its existence, somewhat in the nature of those Italian Banks, which we have seen were called *Monti*. In 1693, one of the schemes devised to raise money for William III., was a Lottery to the amount of a million. A number of bankers united and agreed to purchase tickets in this Lottery, and from thence they were called "the Company of the Million Bank." Their affairs were managed by a board of twenty-four directors, who dealt in Government Annuities; and their joint stock amounted to £500,000. This Bank, or Monte, however, did not last long.

66. We must now trace very briefly the circumstances that led to the foundation of the Bank of England. The troubled era of 1688 not only, as was natural, destroyed what public credit was left, but diminished the productiveness of the taxes, and the new government was obliged to purchase popularity by abolishing the odious hearth tax. The tonnage and poundage, which in the reign of James II. produced £600,000, fell in 1693 to £286,687; and notwithstanding some additional taxes were laid on, the whole revenue in that year was only £1,510,318. Such an income was wholly inadequate to sustain the feeble and unsettled government, and the most extensive frauds and robberies prevailed among the public officers. Some of these frauds were brought to light, and the offenders punished; but though commissioners were appointed for the purpose of discovering the defaulters, the Commons resolved, in 1701, "That it was notorious that many millions of money had been given to his Majesty, for the service of the public, which remain yet wholly unaccounted for." It was alleged that in five years the almost incredible sum of £11,000,000 was thus embezzled.

67. No sooner was William III. seated on the throne, than he renewed with persevering ardour the great idea of his life, that of forming a great European confederacy to overthrow the preponderating ascendancy of Louis XIV. Parliament and the people were ready enough for war with their ancient antagonist, and supplies were eagerly voted; but they were scarce, and difficult to be got. The government at first attempted to persevere in the old plan of mortgaging the grants to be voted by Parliament. Their attempts, however, were not very successful, and in 1690 the system of allowing money to be raised on short annuities was begun, which was attended with good success. The increasing expenses of the war, however, rendered this plan too burdensome, and in 1692 a plan was brought forward for raising duties for the space of 99 years, to pay the interest of an intended loan of £1,000,000 upon a tontine scheme. The subscribers were to receive 10 per cent. till 1700, and after that £7,000 per annum were to be divided among the survivors, till their number was reduced to seven, when, upon the death of each, his annuity was to

lapse to the Crown. So low was the credit of the government, that only £108,100 was obtained on these tempting terms, and a clause was introduced by which the subscribers might obtain 14 per cent. upon any life they chose to nominate. But even these two schemes produced only £881,493.

68. All these devices, however, failed in producing an adequate supply of money to support the war, which languished in consequence. The fatal proceedings of Charles II. seem to have ruined the bankers, or, at least, to have deterred them from making advances in their former style. The government were obliged to revert to the humiliating plan of borrowing from every one in the city they could. They were obliged to solicit the Common Council of London for so small a sum as £100,000, and if they granted it, the Councilmen had to make humble suit to the inhabitants of their respective wards, going from house to house, to solicit contributions; and for these advances they had to pay in premiums, discount, and commission from 30 to 40 per cent.

69. The bankers who had been plundered by Charles II., and their assigns, had, in despair of their rights being acknowledged by the Crown voluntarily, been driven into a court of law. Some of them, however, endeavoured to come to an agreement with the Crown. When it tried to raise money by way of perpetual annuities in 1691, they thought that they might make terms for themselves. On the 18th January, 1692, their proposal was submitted to the House. They said that, whereas the debt due to the bankers and their assigns was above £1,340,000 principal, and 8½ years' arrears of interest at 6 per cent. at Christmas, 1691, they proposed to forego all arrears of interest, and to advance a sum equal to the principal, on condition that interest, at the rate of 6 per cent. should be secured to them by Act of Parliament. This proposal was subscribed by six or seven gentlemen, whose principal money amounted to £29,378, several members of the House, whose principal was £5,400, immediately declared their willingness to accept the same proposals. They believed that most of the others interested would come into the same arrangement. After a few days' delay, persons whose principal amounted to the further sum of £39,775 came in. Those who agreed to these proposals were chiefly the assigns of the bankers, and their creditors. The bankers themselves declined to join in the arrangement, for fear it might prejudice their case in the Exchequer. When the committee who brought up this report to the House first met, a proposal was made to them, that certain parties were ready to subscribe a million, on condition of receiving £65,000 a year, of which £5,000 was to be for management, and the rest for interest, *and that their bills of property, or stock, should have a forced currency, or be made legal tender, in which case they offered to advance £200,000 in cash, to be ready as a Bank, to exchange such current bills as should be demanded of them, to give them credit, and support their circulation, and that they should receive 5 per cent. on that sum.* This scheme was devised by Mr. William Paterson, and supported by several wealthy merchants in the city. The committee declined to receive the proposal for giving a forced currency to this stock, but they

were quite willing to receive such a plan, and make the stock transferable at pleasure. The proposal broke off upon this difference. Paterson and some of his friends were willing to waive the forced currency of the stock, but nothing came of it. Such was the first effort of Paterson to found a National Bank. After this failure no further proposal was made till the beginning of 1694, when the increasing public necessities made the ministry attempt to start such another project. Paterson must evidently have been a person of some weight and consideration, for the ministry sent for him again, and requested him to organize another plan. His second project was to raise a capital of £2,000,000 at 7 per cent. interest. His influence obtained forty men to subscribe £5,000 each, as a fund to circulate £1,000,000 at 8 per cent. The Lords of the Treasury, however, who were accustomed to allow 40 per cent. discount (equal to 66.66 per cent. interest! discount) on tallies at 8 per cent. interest, which had but four or five years to run, could not be persuaded that persons would subscribe at par, to a fund which had no positive determination. We have seen that the Government of Charles II. always borrowed at 8 per cent. with the greatest facility, until he robbed the bankers, so that the credit of the Government of William III. was now much worse. This plan underwent several modifications, but they all failed, and a lottery was started to supply the deficiency, which was equally abortive. Not discouraged by the failure of all these attempts, Paterson persevered and formed another project, which was to raise and circulate £1,200,000 upon a fund of £100,000 a year. Some party jealousy came at the opportune moment to assist him. Mr. Michael Godfrey, brother to Sir Edmundbury Godfrey, and some persons who were nettled at some transactions with the East India Company, now took Paterson up, and, in effect, supplanted him, for though he continued to advise and assist in the direction of the measure, Godfrey stood foremost in it, and was considered, both by the Ministers and the Parliament, as the efficient man, on whom all depended, and to whom all acknowledgments were to be paid.

70. This scheme at last succeeded; after the details had been settled in concert with the ministers, it was brought before the Privy Council, and long and anxiously discussed in the presence of the Queen. It was introduced into the House of Commons by Mr. Montague, who afterwards played such a conspicuous part in the restoration of the coinage, and the first great currency debate of modern times (MONTAGUE). And at last, after passing through many hair breadth escapes, and being more than once on the very point of being lost, the Act, Statute 1694, c. 20, was passed, by which the Bank of England was established.

71. Few things can be more surprising than that a system which had been in operation for centuries in Italy, and which had conducted so much to the stability, nay, even to the existence of so many of the Italian governments, had not been adopted in England before this time. The debt created by the establishment of the Bank of England was the first attempt in England to raise money by way of perpetual annuities; and it did not take place until the chief power in the

state had finally passed away from the Crown to Parliament. Only thirteen years after the Revolution, the king, in his speech to Parliament, 30th December, 1701, presses the House of Commons to take care of the public credit, "which," he says, "cannot be preserved, but by keeping sacred that maxim, that they shall never be losers who trust to a parliamentary security." How different from the sentiments of preceding monarchs!

72. The Act incorporating the Bank of England received the Royal assent on the 25th of April, 1694, and the chief provisions in it (Statute 1694, c. 20) are as follows:—

I. After providing for raising certain taxes mentioned in the Act, it directed that the sum of £100,000 a year should be appropriated to the encouragement of persons making a voluntary loan (i. e. a *Monte*) of £1,200,000, for the purpose of carrying on the war with France, in the following manner.

II. The Crown might appoint commissioners to receive subscriptions for the sum of £1,200,000, before the 1st August, 1694, from any person native or foreign, bodies politic or corporate, to be paid into the Exchequer, and the said sum of £100,000 per annum was set apart, to be paid to the use of the subscribers, their heirs, successors, or assigns. * * *

III. The Crown was empowered to authorize, by Letters Patent, the subscribers to the loan to assign, and transfer their stock and interest, and to prescribe the manner of doing so, and to erect them into a corporation, to be called the Governor and Company of the Bank of England, with all the usual privileges of a corporation, together with the power to acquire and hold lands, rents, tenements, and hereditaments of all descriptions, in as full a manner as any private individual, subject to a proviso of redemption.

IV. That in case the whole sum of £1,200,000 should not be paid into the Exchequer by the 1st January, 1695, then the payment to the subscribers should only be at the rate of 8 per cent. on the sum advanced; and that at any time after the 1st August, 1705, upon Parliament giving twelve months' notice, and repaying the whole of the debt due, the Corporation should cease and determine.

V. No single person was to subscribe more than £20,000, and one-fourth was to be paid down at the time of subscription, and the remainder before 1st January, 1695; in case of non-payment of the remainder, the first instalment was to be forfeited to the Crown.

VI. Unless at least one half of the capital was subscribed before the 1st August, the subscribers were not to be made a corporation, but those who had subscribed might transfer their stock and annuities as individual creditors of the Crown.

VII. The Corporation was strictly forbidden to borrow or give security by bill, bond, covenant, or agreement, under their common seal, for any sums exceeding £1,200,000, except they were allowed to do so by Act of Parliament. In case they exceeded this limit, the proprietors were to be liable in their private capacities.

VIII. The Corporation were allowed to deal in bills of exchange, to buy or sell bullion, gold and silver, to lend money on the security of

goods and wares, and merchandize, and if the loan was not repaid within three months of the time agreed upon, to sell such goods; and to sell goods the produce of their own lands.

IX. But they were strictly forbidden, either directly or indirectly, to deal or trade, or to permit any one on their behalf to deal or trade with any of the money, stock, or effects of the Corporation, in buying or selling any goods, wares, or merchandize, under the penalty of forfeiting treble the value of the goods to any common informer.

X. All the bills, obligatory and of credit, under the seal of the Corporation, made or given to any person, might, by indorsement of such person, be freely assigned to any person who should voluntarily accept them, and so by such assignees *toties quoties*, by indorsement thereon, and all such assignees might sue thereon, in their own names.

XI. That if the Corporation should purchase any Crown lands or advance any money to the Crown whatever, except by the special permission of Parliament, they should forfeit treble the value of all such advances, one-fifth to any common informer, and the remainder to the public.

XII. All fines, amerciaments, and judgments recovered against the Corporation, might be paid by the officers of the revenue, out of the annuity of £100,000.

In pursuance of this Act, a commission to receive subscriptions was nominated on the 15th June, the whole stock was subscribed for in ten days, and the Charter of Incorporation was issued on the 27th July.

73. This great experiment was regarded with some doubt and misgiving, even by its zealous supporters, they feared it could hardly be successful with so moderate an interest as 8 per cent. But several very numerous classes of people regarded it with the utmost detestation. The usurers, whose inordinate gains were checked, were filled with rage. Some said it would become a gigantic monopoly, engross all the money in the kingdom to itself, and combine with the king to set up a despotism. Some inveighed against its granting interest, which they said would draw away money from trade, quite forgetting that all the private bankers gave interest, and not perceiving in the blindness of their passion, that if the Bank allowed interest to its customers, it must advance money to traders to make it. Some became extremely anxious for the morals of the nation, which were to be placed in extreme peril by the new Bank. Some said that Banks and Storks were only to be found in republics, and prophesied a revolution. Some pretended to dislike it, for fear it should dis appoint the king in the expected supplies. The domestic enemies of the government were furious against it, because they saw how enormously it would strengthen the new dynasty.

74. We must now make a few extracts from a pamphlet entitled, *A brief Account of the intended Bank of England*, 1694, said to be by Mr. Michael Godfrey, which will illustrate the view we have given of the meaning of the word Bank, as well as the effects which were expected to be produced by it. He says, p. 1,—“The want of a *Bank* or *public fund*, for the convenience and security of great payments, and the better to

facilitate the circulation of money, &c." He also notices the common objections to the institution of a Bank—"But all this while our more refined politicians assured us that we must never think of settling Banks in England without a commonwealth; and this notion became so universal, that it was a matter of derision for any one to seem of a contrary opinion." He then confutes the supporters of the Land Bank schemes, and of inconvertible paper currency, "They now run from their new mistake to an old one, that the stamp, or denomination, gives or adds to, the value of money. With this they resolved to run counter to all mankind," and he repudiates all idea of a paper currency not based on gold and silver, p. 9. "It is necessary to premise, whatever our notionists may imagine to the contrary:—

"I. *That all money, or credit, not having an intrinsic value, to answer the contents or denomination thereof, is false and counterfeit, and the loss must fall one where or the other.*

"II. *That the species of gold and silver being accepted and chosen by the commercial world for the standard, or measure of other effects, everything else is only counted valuable, as compared with these.*

"III. *Wherefore, all credit not founded on the universal species of gold and silver is impracticable, and can never subsist—neither safely, nor long—at least, till some other species of credit be found out and chosen by the trading part of mankind, over and above, or in lieu thereof.*"

After describing the rise of interest, and the necessities of the government, he says—"For remedy of which, it was proposed some years ago, that a public transferable fund of interest should be established by Parliament. * * * In this manner it was proposed that the constitution of this fund, should, in the practice, answer the end of a public transferable fund of interest, of a Bank, and of a public Lombard at once." And again, p. 5,—*"All this while the name of a BANK or CORPORATION was avoided."* So, p. 7,—*"But though the gilded name of a Bank, and the popular one of a Corporation, &c."* So, p. 9,—*"Others of the learned tell us that this Bank, or Fund, will be so profitable."* And he clearly points out what advantage it would have in augmenting the currency, p. 17, "And if the proprietors of the Bank can circulate their foundation of £1,200,000, without having more than two or three hundred thousand lying dead at one time or with another, this Bank will be in effect as £900,000, or a million of FRESH MONEY brought into the nation, and £900,000 or a million that must have been employed in doing what the Bank will apply, may be employed to other purposes." Thus we see that the express intention of the founders of the Bank, was to increase the quantity of the currency, and that such an idea as the currency principle, or that the notes in circulation should only be equal to the coin they displaced, is not countenanced by them. (CURRENCY PRINCIPLE).

75. The institution of the Bank was followed immediately by the greatest relief to the financial distresses of the government. The war, which had long been languishing, was prosecuted with renewed vigour. All contemporary accounts agree as to the flourishing condition of the Bank,

for the first eighteen months of its existence. We must direct the attention of our readers to a pamphlet published by Mr. Michael Godfrey, in June or July, 1695, (GODFREY, MICHAEL), because it will be found that this pamphlet contains statements of fact, which are of great importance in the theory of the currency. And the circumstances of an event which we shall shortly come to, are dwelt upon by the Bullion Report, (BULLION REPORT), and by Sir Robert Peel, in his speech in introducing his Bank Act of 1844, (PEEL, SIR ROBERT), and therefore they are of great historical importance.

76. We have shewn elsewhere, (COINAGE), the disgraceful condition in which the silver coinage was at this period. We have shewn that it had been gradually getting worse during the reign of James II., and William III.; and that guineas, which were current for 21s., after their first appearance, gradually rose till, in 1695, they were usually current at 30s. each, from the clipped, worn, and debased state of the silver money. The Bank of England differed in this respect from the Bank of Venice, that in the latter Bank, the quantity of bullion in the coins deposited by its customers was weighed, and they only received credit for the actual amount of that. Consequently, it never could be called upon to pay more bullion than it actually received. But the Bank of England had not the same foresight. It received the coins at their nominal value, and its notes were payable on demand; consequently, if it received a depreciated coinage, and paid its notes in a full-weighted one, it thereby paid more bullion than it received, and thereby incurred a manifest loss, and a process of this kind continued for any length of time must necessarily have brought on a stoppage.

77. The Bank of England was a Whig project, and had been eminently successful in supporting the government in the prosecution of the war. But it had no monopoly created in its favor. We have already seen that multitudes of projects of Banks were afloat at this time. Among others, there was one promoted by a knot of persons, who were in many respects the precursors of John Law. The most notorious of them were Asgill, Briscoe, and Chamberlen, (ASGILL, BRISCOE, CHAMBERLEN). Chamberlen had matured a scheme for establishing a Bank of Credit upon land, and on the 7th of December, 1693, he and others presented a petition to the House of Commons, praying for leave to erect it. This petition was referred to a committee, who reported on the 5th February, 1694, that it was practicable, and likely to be beneficial to the nation. Fortunately, however, it went no further. The undoubted success of the Bank of England stimulated the efforts of this party, and the plan was again brought forward. King William's government were at this time formed of a mixture of Whigs and Tories. The Tories warmly patronized the new scheme. The capital of the new Bank was to be £2,564,000, which was to be advanced to government on the same principle as the Bank of England, but its trading capital, notes, &c., were to be advanced solely to landowners, for the cultivation of the land, at 3 per cent. It was, therefore, called a Land Bank. The friends of the Bank of England, who thought that they had a virtual, if not

an expressed monopoly, warmly opposed it. But the country gentlemen were dazzled with the idea of obtaining an unlimited quantity of money, at 3 per cent., when they usually paid three or four times as much. The government were too anxious to have such a timely assistance to carry on the war, and by these means an Act was passed for its establishment in April, 1696.

78. The rivalry between the supporters of the two Banks was now inflamed to the highest degree. We have shown the prostration of trade during the time the silver coinage was called in to be recoined (COINAGE, EVELYN), and before there was a sufficient abundance re-issued. The success of the Bank of England had also enraged the private bankers and money dealers, whose profits it diminished. All its enemies now made a combined movement to destroy it. They collected its notes in all directions, and on the 5th May, 1696, they suddenly presented for payment £80,000 of notes. The Directors, after a solemn deliberation, knowing the purpose for which they were presented, between twelve and one o'clock REFUSED PAYMENT of these notes, but continued their payments to their ordinary customers. As the whole transaction was thoroughly understood by the public, this suspension of payments did not, at first, have much effect upon the value of their notes, notwithstanding all the efforts of their enemies, who went about crying that the Bank was destroyed. But the extreme scarcity of the silver coin still continuing, they were obliged to make a general suspension, and they gave notice that they would only pay cash by instalments of 10 per cent., once a fortnight; and they could not maintain even that payment, but were obliged to reduce it to 3 per cent. once in three months.

79. But the finances of the state were thrown into a state of complete disorder by the total failure of the Land Bank (LAND BANK). Great arrears were due in every branch of the public service, some funds were wholly deficient, others produced much less than was calculated. Moreover, the Bank itself had not seen wherein the true functions of Banking consisted. They gave notice in the Gazette that they would lend money on plate, lead, tin, copper, steel, and iron, at 4 per cent. per annum. Much of their funds were locked up in these advances. The consequence was, that their notes soon fell to a discount of 20 per cent. When Parliament met in October, 1696, Exchequer tallies were at 40, 50, and 60 per cent. discount, Bank notes at 20 per cent. But at this time the EXCHANGES WERE RESTORED TO PAR, in consequence of the new money from the Mint coming into circulation more freely. We must beg to call the special attention of our readers to this fact, which will be found to be of great importance, *that in October, 1696, while Bank Notes were at 20 per cent. discount, the Exchanges were at par* (CARY, JOHN). This fact is of decisive authority in the theory of the Currency (BULLION REPORT; PÉEL, SIR ROBERT).

80. When Parliament met in October, 1696, it ordered the amount of arrears to be laid before it, when there appeared to be the enormous sum of £6,000,459, more than all the current coin in the kingdom was supposed to amount to. But these trying circumstances only called forth

their patriotic spirit with increased force. They immediately passed a vote that they would not alter the standard of the gold and silver coin in fineness, weight, or denomination, and that they would make good all deficiencies in the funds.

81. When the Bank of England was subjected to the mortification of declaring a partial suspension of payments, it endeavoured to retrieve its credit by making two calls of 20 per cent. each upon its proprietors, the second of which was payable on the 20th November. These measures, however, were not effectual. The calls were not promptly paid, and their funds were locked up. In February, 1697, Parliament had to take in hand the great business of restoring public credit, namely Bank notes and Exchequer tallies. On the 3rd of February, 1697, it agreed to increase the capital stock of the Bank, by receiving new subscriptions, which were to be made good by tallies and Bank notes. An Act for this purpose was passed, Statute 1697, c. 20. The chief provisions were as follows:—

I. All persons, natives or foreigners, bodies politic or corporate, might subscribe to the new stock, and the subscriptions might be paid four-fifths in Exchequer tallies, and one-fifth in Bank notes, upon which the Crown would allow 8 per cent.

II. Before the 24th July, 1697, the capital stock of the Bank was to be estimated, and to be made up to 100 per cent.; any deficiency was to be made up rateably by the proprietors, and any overplus to be rateably paid back to them.

III. All such subscribers were to be incorporated with the proprietors of the old stock.

IV. The time when the Crown might put an end to the Corporation was prolonged to twelve months after the 1st August, 1710, and repayment of all Parliamentary debts.

V. It was enacted, that during the continuance of the Corporation of the Governor and Company of the Bank of England, no other bank, or any other corporation, society, fellowship, company, or constitution, in the nature of a Bank, should be erected, or established, permitted, suffered, countenanced, or allowed, by Act of Parliament, within this kingdom.

VI. The Bank was allowed to extend its issues of notes beyond the original capital of £1,200,000, to the amount of new capital, which should be subscribed, provided that they were made payable to bearer on demand, and in case they made default in such payment, they might be paid on presentment at the Exchequer, out of the annuity due to the Bank. All notes above the sum of £1,200,000, were to bear a distinguishing mark.

VII. All the property of the Bank was exempted from taxes.

VIII. Bank Stock was to be personal property, and not real.

IX. It was made felony to forge or counterfeit any Bank note, or obligation under the common seal, or to alter, or erase, any indorsement on such a bill or note.

X. Bank Stock was exempted from any foreign attachment.

XI. The debts of the Corporation were forbidden to exceed their capital stock; if they did

so, the members were to be liable in their private capacity.

XII. All persons were forbidden to buy or sell tallies, at more than the legal rate of interest, under the penalty of forfeiting treble the value of the money.

82. Such were the measures taken to restore the credit of the Bank. And we observe that *their own depreciated notes were taken as payment, and treated as cash in the new subscription.* And not only that, but they were allowed to issue fresh notes upon these depreciated notes and exchequer tallies, as capital. These facts illustrate some subtle points in the theory of Credit (BANK NOTES, CREDIT, PAYMENT). The public, however, were still grievously suffering from want of a circulating medium, during the slow progress of the re-coining. The Bank did not issue notes below £20, which were of little use for the ordinary purposes of daily life. Montague, the Chancellor of the Exchequer, hit upon the plan of issuing Exchequer bills for £10 and £5. These bills, at first, passed at a small discount, but upon a second issue £7 12s. per cent. was allowed, and they were received in payment at par. They soon rose to par. The treasury was authorized to contract with any persons to cash these bills on presentment, allowing them a moderate premium. They were allowed 10 per cent. at first, but the Exchequer bills soon rose above par, and then the interest was reduced to 4 per cent. Under this Act, upwards of £2,000,000 of Exchequer bills were issued. These measures produced their effects very slowly; for in May, 1697, the Bank called upon those persons who were in arrear of the calls due in the previous November, as also those indebted to them on mortgages, pawns, notes, bills, or other securities, to pay in the said 20 per cent., and the principal and interest of these securities, by the 1st of June next. And at the end of that month, Bank notes were still at a discount of 13 and 14 per cent. From that time things gradually mended. The new subscriptions to the Bank, under the Act, amounted to £1,001,171 10s.; £200,000 of Bank notes and £800,000 of Exchequer tallies being taken out of circulation, and received at par in the subscription, raised the value of the remainder, and by the end of the year Bank notes, which bore no interest, were at par, and the bills, which bore interest, were at a premium.

83. We have felt it necessary to be thus minute and circumstantial in the account of this great monetary crisis, because it is of very great importance in the theory of the currency, and because it has been very prominently noticed in the Bullion Report; and it will be necessary for us to examine the account of it given there, in its proper place (BULLION REPORT), because it was prominently brought forward by Sir Robert Peel, in his speech in bringing in his Bank Act of 1844.

84. The political troubles at the commencement of the next century placed the Bank in difficulties again, in 1704 and 1707. In the latter year, the revived hopes of the Jacobites, which were encouraged by Louis XIV., threw the country into a panic. The public Stocks sank 14 to 15 per cent. The enemies of the dynasty, and the enemies of the Bank, combined to make a run upon it. The private bankers tried to swamp

their great rival, and Sir Francis Child pretended to refuse its notes. But it must not be denied, that it was alleged that the Bank itself had been guilty of these unworthy tricks. It is said, in a pamphlet entitled, *A short View of the apparent Dangers and Mischief of the Bank of England*:—"But it must not be denied, that their too great credit has been often employed for oppressing others. The gentlemen that have had the management of the Bank have too often given specimens of their tyranny; and I could tell you, when by running on a certain goldsmith with intent to ruin him, and by him the credit of his neighbours, they gave such a shock to credit in general, that they themselves suffered severely, in their own contrivances." The malicious proceedings, however, of its enemies called forth an equal amount of ardour from the government and its friends. Several of the highest nobility came forward to lend money to the Corporation, and the Queen lent it her warmest support. The Directors made a call of 20 per cent. on their proprietors, and by these means surmounted their difficulties, and restored their credit.

85. In 1709, the government were again in a state of great pecuniary embarrassment. The produce of the taxes scarcely covered one half of the expenses. In this extremity, the ministry turned to the Bank of England, and, by mutual arrangement, the following terms were proposed, and accepted by Parliament:—

I. That the interest upon their original stock of £1,200,000 be reduced to 6 per cent., with an allowance of £4,000 for managing the debt.

II. That they were to advance a further sum of £400,000 at 6 per cent. interest.

III. That they should be allowed to double their present capital of £2,201,171 10s., at the price of 115 per cent. for the new stock. Upon which they agreed to circulate £2,500,000 of Exchequer bills, and receive an allowance of 6 per cent.; one half for interest, and the other for repayment of the principal, and that no more Exchequer bills should be issued without the consent of the Bank.

IV. That their privileges as a corporation should be continued for 21 years from the 1st of August, 1711.

86. The subscription lists for the new stock were opened on the 22nd February, 1709, at nine in the morning, and by one o'clock the whole sum was subscribed at the premium. And a million more might have been subscribed before evening if there had been room.

87. But a still more important monopoly was created in favour of the Bank by this Act. The Act of 1697 had only provided that no other Bank should be sanctioned by Parliament. It did not prevent any private joint stock bank being formed, nor any other corporation or company setting up banking business. Joint stock banks were perfectly legal by common law. But yet they were deemed so essentially affairs of state, that amid all the joint stock projects which were started in 1694, no one appears to have thought of a joint stock bank. But about 1708 a company called the Mine Adventurers of England, at the head of which was Sir Humphry Mackworth, and which included several of the nobility, commenced doing all sorts of banking business, issuing notes, &c. To put a stop to

this, the clause already quoted, § 15, was inserted, prohibiting any company of more than six persons doing banking business, *that is, issuing notes payable to bearer on demand, or at any less period than six months.* And the Bank were strictly forbidden to issue notes to a larger amount than their capital stock.

88. The financial difficulties of the government at the Peace of Utrecht, in 1713, made it necessary to have recourse to the Bank again. They agreed to lend the government £100,000 secured upon Exchequer bills, at 3 per cent., upon receiving an extension of their charter, which had still twenty years to run. By the first Statute 1713, c. 11, its existence as a corporation was prolonged to twelve months' notice, to be given after the 1st August, 1742, and the payment of £1,600,000. By a second Statute that year, they were authorized to lend money upon South Sea Stock.

89. In 1716 an Act, (Statute 1716, c. 8) was passed to redeem and modify several of the public debts due to the Bank, but not altering their privileges in any way, and to make further advances at 5 per cent. They were also authorized to make such calls as they pleased upon their proprietors. They were, besides, exempted from the operation of the usury laws. They were authorized, "at their own good liking" to borrow, or take up money, at any rate of interest they pleased, above the legal rate, upon their bills, bond, or any obligation under their common seal, or upon credit of their capital stock, for any time, or to be paid on demand. In this Act the clause prohibiting any banking partnership of more than six members was repeated. The public debts due to the Bank were consolidated at an annual interest of 5 per cent., and its existence was prolonged indefinitely, until all these annuities and debts were discharged.

90. Up to the year 1711, all the permanent debt contracted by the government consisted of Bank of England Stock. The Bank had always hitherto been allowed to create an equal number of notes to replace the money thus withdrawn from commerce. That is, each loan to government was attended with an *augmentation* of currency to an equal amount. Now, to a certain extent this plan might be attended with no evil consequences, but it is perfectly manifest that its *principle* is utterly vicious. There is nothing more wild and absurd in John Law's theory of money than this. His scheme of basing a paper currency upon land, is sober sense compared with it. *If for every debt the government incurs, an equal amount of money is to be created, why here we have the philosopher's stone at once.* What is the long sought El Dorado compared to this? Even in that the gold required to be picked up, and fashioned into coin. Besides, people in this country would have to go round the globe in search of it. But let us coolly consider the principle involved in this plan of issuing notes upon the security of the public debt. Stated in simple language, it is this. *That the way to create money is for the government to borrow money.* That is to say,—A lends B money on mortgage, and then, on the security of the mortgage, A is allowed to create an equal amount of money to what he has already lent!! Granting that to a small extent this may be done without any practical mischief, yet stated as a general principle,

what can be more palpably absurd? The ravings of Chamberlen himself are not more wild (CHAMBERLEN).

91. At this period the party antagonistic to that which founded the Bank of England were in power. The dismissal of the Whigs had shaken public credit. The unfunded debt of the State was enormous; it amounted to nine millions and a half. Mr. Harley (afterwards Earl of Oxford), the Chancellor of the Exchequer, revived the idea, which we have before noticed as first suggested by Dr. Chamberlen. He persuaded a number of merchants to undertake this debt, upon receiving interest at 6 per cent., and being incorporated as a Company for 32 years, with the exclusive privilege of trading to the South Seas. This was hailed by his party at the time as a masterpiece of financial wisdom. Such was the origin of the South Sea Company, a rival which became infinitely more dangerous to the Bank of England than the Land Bank in 1696. In 1717, the government determined to make a strong effort to reduce the national debts. Proposals were invited from each of these great Companies. The South Sea Company proposed that their then capital of £10,000,000 should be augmented to £12,000,000; that the additional £2,000,000 should be employed in redeeming several public debts, and among these the Bankers' debt; that the interest on their original capital should remain at 6 per cent., and interest at 5 per cent. should be given on the new capital till the 24th June, 1718. After that date, interest at 6 per cent. should be allowed on the whole capital. That the duties upon which such interest was chargeable should be continued, and any surplus after paying them should be applied to redeem other public debts. That all sums of principal and interest might be redeemed upon a year's notice, after 24th June, 1725. That their capital and stock in trade should be exempted from all taxes whatever.

92. The Bank of England proposed that their privileges should remain untouched till 1742, as by the last Act. That an annuity of £106,500 due to them, should be reduced to £88,175 after the 25th March, 1718. They offered to advance £2,000,000, at 5 per cent. interest, on Exchequer bills, redeemable at one year's notice after 1720, and to circulate some others at 3 per cent. That the interest on the Exchequer bills they held should be reduced to 1d. per cent. per diem, but that no more should be issued without their consent. They were further willing to advance £2,500,000 for the public service, at the rate of 5 per cent. per annum. They demanded that their privileges should continue until these sums were redeemed. After a warm debate, the proposals of the South Sea Company were accepted. The Bank of England remonstrated strongly, and petitioned Parliament, reminding them of their eminent public services, and requested that all the public stocks might be made transferable, and payable at the Bank, which duty they undertook to perform without any profit to themselves, on condition that no further taxes should be laid on their capital, or upon their bills and notes. Upon further debate, the proposals of the Bank of England were accepted, as well as those of the South Sea Company, and three Acts were passed to carry them into effect. But the South

Sea Company played a trump card. They invited the King to become their governor, and having well bribed his fat German mistress, the Duchess of Kendal, they succeeded. On the 1st February, 1718, an Act was brought in, to remove any difficulties, and it was read and passed through both Houses on the same day, and on the next received the Royal assent.

93. This skirmish between these two great Corporations, in 1717, was but the prelude to a much more gigantic contest in 1720. On the 23rd November, 1719, the King recommended the state of the public debts to the attention of Parliament. This was preliminary to the introduction of a plan to Parliament, which the Ministry and the South Sea Directors had secretly projected, and determined to bring before the House before any opposition could be organized against it. It was brought in on the 22nd January, 1720. The details are given in the *Parliamentary History* (Vol. VII., p. 536,) and are much too long to be inserted here. But the outline was as follows:—They estimated the whole of the public debt at £30,981,712; they proposed to buy up the whole of these, and consolidate them into one fund, which was to be added to their capital, at 5 per cent. interest. For these privileges they offered a *bonus* of £3,500,000 to the State, payable in four instalments, to commence at Lady day, 1721. This astounding proposal was brought before the House by surprise, but its terms were not so favourably received as was expected, and gave the friends of the Bank time to rally. They reminded the House of the great and eminent services it had done the public, and obtained five days' delay.

94. The Bank determined not to be outdone in audacity. They also undertook to consolidate these debts, and add them to their capital. Upon the whole it was calculated that their proposal was more advantageous to the nation, by about £2,000,000, and was payable in less time. The South Sea Company obtained three days' delay to amend their offer. They increased the bonus to the public to £7,967,500, besides other minor points. The Bank, in a fit of wild desperation, amended their offer. The chief points were that for every £100 annuity for 96 or 99 years, they offered £1,700 Bank stock, and, after the 24th June, 1727, the interest on the whole consolidated funds should be reduced to 4 per cent. absolutely, and thenceforth be redeemable by Parliament.

95. The contest between these gigantic rivals was simply which was to devour the other. The debate was long and fierce; Mr. Robert Walpole was the champion of the Bank, Mr. Aislabie, Chancellor of the Exchequer, was the patron of the South Sea Company. The Bank of England was no where—on the 2nd of April, the South Sea Bill was read a third time, and passed by a majority of 172 to 55. Then it was carried up to the Lords. The debate was equally animated, but, as usual, less garrulous; it was ended in a single day, and the victory of the South Sea Company was still more decisive than in the Commons. The bill passed by a majority of 83 to 17. The king closed the session on the 11th of June, and congratulated Parliament on the good foundation they had prepared for the payment of the National Debt, without violation of the public faith.

96. The price of South Sea Stock on the 7th April, when the bill passed, was £310, next day it fell to £290. On the 12th, the directors opened their first subscription of £1,000,000 at £300 for every £100, having first propagated the most enormous falsehoods of alleged trading advantages they had secured in the South Seas. Twice the sum was subscribed, and in a few days the subscriptions were sold at double the price of the first payment. On the 2nd of June the stock was £890. After some fluctuations, the Company opened their books for a third subscription at £1,000; £4,000,000 were taken at that price, and before the end of June, the stock was at £2,000. The price of Bank stock at the same time was £260. The two following months were the height of the great delirium. By the middle of July, the projects before the country required a capital of £300,000,000. But the bubble was then on the eve of bursting. On the 2nd of September the South Sea Stock was at £700; on the 13th it fell to £400. All the efforts of the directors to retrieve its credit were vain. They were then compelled to make humble suit to their vanquished rivals. With great difficulty Walpole was prevailed upon to intercede in their favor with the Bank of England. After a long negotiation the draft of a contract was agreed upon by the Bank for providing means to sustain the credit of a number of their bonds. The terms were brought before the proprietors of the Bank, and approved of by them. Before, however, it could be embodied in a legal form, affairs took a very different turn. A great many of the goldsmiths and private bankers had advanced great sums on the South Sea Stock; when this fell, it brought a run upon them. Many stopped payment, and absconded. The Sword Blade Company, who were the cashiers to the South Sea Company, stopped payment. This portended universal bankruptcy. The bank had been assailed with every species of public abuse, because it had hesitated to lend its aid in supporting the South Sea Bonds. Every one looked upon it as the sole pillar of credit, but it was now in danger itself. The general failure of the bankers immediately brought a run upon it. The Bank, in these straits, devised a trick to prolong the payments. It employed a number of clerks to tell out the money that was demanded, as well as what was brought in. Payments were made in light sixpences and shillings, and large sums were paid to particular friends, who went out with their bags at one door, to deliver them to people placed at another, who were let in to pay the same money to tellers, who took time to count it over. These persons, of course, were always served first. By these means time was gained, the friends of the Bank rallied round it, and made large subscriptions to support the company, the festival of Michaelmas, at which it was usual at that time to shut up the Bank, came, and when it was opened again, the public alarm had passed off.

97. But something was required to be done to restore public credit. The South Sea Company were permitted to sell annuities to the value of £200,000 a year. The Bank bought them at twenty years' purchase, and was allowed to add the £4,000,000 to its capital; it then stood at £8,959,995 14s. 8d.

98. Up to the year 1722 the Bank had divided the whole of its profits among the shareholders, and had made no reserve for any contingencies. The dividend in consequence had been extremely variable. It had fluctuated from $18\frac{1}{2}$ per cent. in 1706 to 6 per cent. in 1722. The inconvenience of this was strongly felt, as as well as having no fund to fall back upon in cases of emergency. These had hitherto been met by calls upon the proprietors. In this year the directors established a reserve fund, which is called the Rest.

99. Several financial transactions took place between the government and the Bank, which need not be detailed here. Upon the previous occasions of the renewal of the charter, there had been much public discussion as to the expediency of continuing this monopoly. The Bank, however, had always been able to relieve the continually embarrassed state of the finances, and had thus purchased its privileges. As the time was drawing near for the expiry of the monopoly in 1742, these discussions became more frequent and animated, and several attempts were made to set up banks in such a manner as to evade the clause in the Act of 1709. But against all the arguments of its opponents the Bank had a very solid and conclusive reply. The government was, as usual, in difficulties, and the Bank agreed to lend them £1,600,000 without interest. In consideration of this, their exclusive privileges were continued till twelve months' notice after the 1st August, 1764. It was besides determined to stop up all loopholes in the Act of 1709, and the clause already quoted, § 17, was inserted, framed in the most comprehensive terms that the ingenuity of lawyers could devise, to prevent any rivals, and which did have that effect for a long period.

100. In September, 1745, the rebellion in Scotland seemed to be assuming formidable proportions, and produced a run upon the Bank, which was fomented by the friends of the Prince, in order to get money to assist him, as well as to embarrass the government. The Directors resorted to the same expedient as they had done in 1720—to protract payment, and to give time for their friends to rally. Bank notes fell to a discount of 10 per cent. In this crisis Sir John Barnard, one of the members for the city, took the lead, and at the head of 1,600 merchants and principal traders, met at Garraway's Coffee-house, on the 26th September, and came to a resolution pledging themselves to support the credit of the Bank notes.

101. In 1746, the Ministry were again in difficulties from the political disturbances of the preceding year, and they were obliged to apply for assistance to the Bank. The proprietors authorized the Directors to cancel £986,000 of Exchequer bills, upon receiving an annuity of 4 per cent., and to create new stock for that purpose. This increased the paid up capital to £10,780,000, which was not further augmented till 1782. In 1750 the interest upon £8,486,000 of the debt due to them from government was reduced to 3 per cent.

102. In 1759 the Bank began to issue £15 and £10 notes, none before this time having been below £20.

103. In 1764 the Bank's charter expired. The

terms of renewal were an absolute gift of £110,000 to the nation, and a loan of £1,000,000 on Exchequer bills, for two years, at 3 per cent. interest. The Charter was renewed on these terms, and the monopoly continued till twelve months' notice after 1st August, 1786, and the repayment of the government debt.

104. In 1772 the first of those great commercial panics took place, in which the Bank was called upon to take a prominent part in supporting public credit. The two preceding years had been distinguished by the most extravagant overtrading. On the 10th June, 1772, Heale and Co., bankers in Threadneedle Street, stopped payment, involving several others. The Bank of England and some merchants came forward to support credit, which for a few days had the appearance of being successful. But in ten days' time, a general crash ensued. Among others, the great banking house of Colebrook stopped payment, who were the correspondents of the Ayr Bank, in Scotland. That rotten institution stopped payment, and involved a large district of country in ruin and desolation (*BANKRUPT IN SCOTLAND*). The whole city was in consternation; there had not been such a prospect of a general bankruptcy since the South Sea Scheme. By the measures taken, the panic was at length allayed, but the bankruptcies of that year amounted to the unprecedented number of 525. These speculations had been general throughout Europe, and in 1773 the crash extended to Holland. About the beginning of that year, the failures in that country were of so alarming a nature, and so extensive in their influence, as to threaten a mortal blow to all credit, public and private, throughout Europe. They were caused by great speculative dealings in trade, as well as in the public funds of different countries, and the losses were estimated at £10,000,000.

105. It was about this period, though the exact date is difficult to ascertain, nor is it very material, that the London bankers discontinued the issue of Bank notes, and adopted that change in the method of doing business, which we have mentioned in § 20. The method of doing business by means of entries and cheques, instead of Bank notes, had so many practical advantages over them, that it universally superseded them in London; and from that time forward London bankers ceased entirely to issue notes, though they never were forbidden to do so until the Act of 1844. This change, simple as it was, is of great historical interest, for it was the circumstance which destroyed the monopoly of the Bank of England. By a fortunate accident, the opportunity that this method afforded of circumventing the monopoly of the Bank, was not discovered till many years afterwards. If it had been, there cannot be a doubt but that Parliament would have put it down very quickly, for it was the manifest intention of the Legislature to confer a *bonâ fide* and absolute monopoly upon the Bank. When it was discovered, the age of such monopolies had passed away, and the demand of the Bank to have it provided against was refused.

106. The termination of the seven years' war took place in 1763, when it is usually said that this nation finally took that rank in the scale of nations which she at present holds. After long

and doubtful contests, in which victory often trembled in the balance, the star of England triumphed over that of France, both in the East and in the West. Coincidentally with this, the industrial energies and mechanical genius of the nation burst forth with unparalleled splendour. Previously to this time, Great Britain was probably more backward in great public works than any state in Europe. She could show nothing that could be compared with the great French and Spanish engineering works. The Canal de Briare, made by Henry IV., preceded the first canal in England by 150 years. The great canal of Languedoc was completed upwards of half a century before the smallest canal in England was begun. And Spain had preceded France by three quarters of a century. The canal of the Ebro is due to the genius of Charles V. In Italy, Gerbert (Sylvester II.), the morning star of modern literature and science, was famous for his hydraulic works in 999; and those of Lombardy, executed in the eleventh century, are still the admiration of modern engineers. The first Act for a work of this nature, however small, in England, was passed in 1755. Facility, quickness, and cheapness of transit are the very foundation of commercial greatness. Brindley, the father of the modern commercial greatness of England, completed the canal from Worsley to Manchester in 1762. This was as prodigious a stride in advance of the age as the opening of the railway from Manchester to Liverpool was in its day. The success of this was triumphant. Then commenced the great era of canal making. Within 25 years the country was covered with a network of canals, such as no other country in Europe, but Holland, can boast. Taking into consideration the comparative wealth of the country at the two periods, the period from 1770 to 1795 was fully as wonderful an effort in canal making, as the period from 1830 to 1855 was in railway making. Concurrently with this prodigious extension of the powers of transport, an equal extension of the powers of production took place. The year 1769 witnessed the birth of James Watt's STEAM ENGINE and Arkwright's SPINNING JENNY. Thus BRINDLEY prepared the means of transport, WATT and ARKWRIGHT then enabled men to produce, and ADAM SMITH taught them to exchange. Mysterious, that such men, each of whose minds was so marvellously adapted to each of the others, should all flourish at the same time. Each of their labours was necessary to give full development to the powers of the others. It would almost seem like a dispensation of Providence, that at this particular period such an extraordinary outburst of mechanical genius took place. It would almost seem that these three men, Brindley, Arkwright, and Watt, were specially raised up by Providence to elaborate those miraculous resources which, it is impossible to doubt, carried this country triumphantly through that terrific contest, which was then just about to burst upon the world.

107. We have seen that the Bank of England at its foundation received no monopoly. But when we consider the unquestionable services which it had rendered to government, and the terrific state of public credit, owing very much to the total failure of the Land Bank, we need not be surprised that the Bank of England em-

ployed these circumstances for the purpose of procuring a monopoly, nor considering the ideas of that age, can we be surprised that they received it. But, nevertheless, making allowance for all these circumstances, it is one of the most deplorable Acts that have come down to our time. The founders and the contemporaries of the Bank felt the benefit of its eminent services, but the consequences of this original sin fell with terrific force on their descendants of the third and fourth generation. Many an evil principle may lie dormant for a long time, and produce no apparent mischief, till some particular circumstances arise, which call it forth. It was just at this period, that the original sin of the monopoly of the Bank began to tell upon the country. The seeds of future ruin, misery, and desolation were now sown broadcast throughout the land. The prodigious development of all these industrial works demanded a great extension of the currency to carry them on. What was required was to have banks of undoubted wealth and solidity, to issue such a currency. Bank of England notes had no circulation beyond London. Its monopoly prevented any other great banks being formed either in London or the provinces, and it would not extend its branches into the country. Scotland possessed at this time three great and powerful joint stock banks, and it was just at this period that they began successfully to extend their branches into the country. England required to have a currency, and as it could not have a good one, it had a bad. Multitudes of shopkeepers in the country, grocers, tailors, drapers, started up like mushrooms, and turned bankers, inundating the country with their miserable notes. Burke says that when he came to England in 1750, there were not twelve bankers out of London, in 1793 there were nearly 400. It is no doubt true that many of the most respectable banking firms of the present day also took their rise at this time, but they were comparatively speaking few, the great majority were such as we have described above.

108. In 1782 the unhappy war with America was fortunately terminated, and immediately a prodigious extension of the foreign commerce, which had been previously unusually restricted, took place. The enormous markets thrown open to the merchants, led to the most extravagant over trading, which was greatly fostered by the most incautious issues of the Bank, and a very alarming crisis began, which threatened to compel them to stop payment. The directors, however, considered that if they could only restrain their issues for a short period, the returns in specie in payment of the exports, would soon set in in a more rapid manner than they went out. They determined, therefore, to make no communication to the government, *but for the present to contract their issues, UNTIL THE EXCHANGES TURNED IN THEIR FAVOR.* The alarm felt by the Bank was the greatest in the month of May, 1783. They then refused to make any advances to the government on the loan of that year, but they did not make any demand for payment of the other advances to the government, which were then between nine and ten millions. They continued this policy up to October, when at length the drain had ceased from the country, and money began to flow in from abroad. At length in

the autumn, when the favorable signs began to appear, they advanced freely to government on the loan, although at that time the cash in the Bank was actually lower than at the time when they felt the greatest apprehension. It was then reduced to £473,000.

109. The doctrine then stated by Mr. Bosanquet that guided the directors was this,—That while a drain of specie is going on, their issues should be contracted as much as possible, but that as soon as the tide had given signs of ceasing and turning the other way, it was then safe to extend their issues freely. This was the policy they acted upon, and it was entirely successful, and the credit of the Bank was saved.

110. The enormous multiplication of country banks had given rise to a great and undue extension of internal trade in this country, which was also the case throughout Europe, and the United States for some years, before 1792. The amount of bank notes in circulation, which was under six millions in 1784, had increased to nearly eleven millions and a half in 1792. At length, in the autumn of 1792, commercial failures began both here and abroad, as well as in America; the average of bankruptcies during the first two months had been 50, in November they suddenly rose to 105. This unusual number created great uneasiness, but they diminished in December. In January, 1793, they rose again. The French revolution was now advancing with rapid strides, the king had been a prisoner ever since the 10th of August. In November the Convention published what was tantamount to a declaration of war against every established government in Europe. Great Britain deemed it expedient to arm. A strong political ferment was manifesting itself throughout the country. On the execution of Louis XVI., the British Government expelled the French Ambassador, and the Convention instantly declared war. The actual declaration of war, though it must evidently have been foreseen, gave a shock to credit, which was already staggering. On the 15th of February, a house of considerable magnitude deep in corn speculations, failed, and on the 19th the bank refused the paper of Lane, Son, and Fraser, who stopped next morning with liabilities to the amount of nearly a million, involving a great number of respectable houses. In the meantime the panic spread to the bankers. It began at Newcastle. The partners in the Banks there were opulent, but their private fortunes were locked up. They issued notes bearing interest to commence at some months after date, and then they were payable on demand; when the run came they were unable to realize, and stopped payment. The panic immediately spread throughout the country, and out of nearly 400 banks, which there were then, 300 were greatly shaken, and upwards of 100 actually stopped payment. The banks of Exeter, and the West of England, almost alone stood their ground. They issued notes payable at 20 days sight, with interest commencing from the date of the note, and ceasing on the day of acceptance. The best contemporary authorities are unanimous in attributing this terrible disaster to the inordinate multiplication and reckless operations of these country "bankers," who had been established in

almost every town, and even village in the country.

111. This great pressure extended to the London bankers, as well as to the country ones. One of them says that the extraordinary state of credit had obliged every person connected with trade, and money transactions, to gather in and husband every resource to meet all demands. That for six weeks back, every man of money and resources had been straining every nerve to support himself and immediate friends, and could not give that support to others which they would have been disposed to do. All these circumstances naturally produced a demand on the Bank of England for support and discounts; but the Bank, being thoroughly alarmed, resolved to contract its issues. Bankruptcies multiplied with frightful rapidity—the Government urged the Bank to come forward and support credit, but they resolutely declined.

112. This great crisis is the first of modern times, which is absolutely indispensable for the political economist to study attentively; but the Bank having totally declined to do anything to mitigate it, had no hand in alleviating it—and, therefore, we shall say no more about it here. Sir F. Baring has some valuable remarks upon it, in his *Observations on the establishment of the Bank of England, &c.*, which we have quoted elsewhere, (BARING, SIR FRANCIS), and the pathology of the crisis is considered along with that of subsequent ones in its proper place. (CRISIS, COMMERCIAL.)

113. Sir Francis Baring and Mr. Tooke both agree in saying, that nothing could be more satisfactory than the financial condition of the country during 1794, and part of 1795. Both agree that the embarrassments which led to the catastrophe of 1797 had their origin in the latter part of 1795. Mr. Tooke places the commencement rather earlier than Sir F. Baring. He states that the winter of 1794-5 was one of the severest on record, and that in the spring of 1795, apprehensions began to be felt for the growing crops. The prices of all sorts of corn advanced rapidly. The spring of 1795 was very cold and backward, the summer wet and stormy, and the harvest unusually late. Under these circumstances, wheat, which was at 55s. in January, reached 108s. in August. The same scarcity was general throughout Europe and America. France was in a still worse position than England, and the Government still further to embarrass her, and afford relief to this country, seized all neutral vessels laden with corn, bound for France; it also employed agents to buy corn in the Baltic ports, where its price had already been raised greatly, in consequence of large purchases on account of the French Government.

114. Sir Francis Baring also states that the method in which the Government contracted the loan that year tended much to aggravate the evil. He says that, in former wars, it had been usual for the Government to contract with none but the most respectable monied men, who had the undoubted power to fulfil their engagements. On this occasion the minister contracted with men who had not that power, and in order to make good their payments, they were obliged to have recourse to operations on foreign places, which deranged the exchanges, and had a still further effect in raising the rate of interest in this country.

115. These causes alone were sufficient to create a monetary pressure, but though they would have

been inconvenient, there would have been nothing alarming in them; they were, however, aggravated and intensified by other circumstances, which we must now relate.

116. The enormous abuses which might be perpetrated by an unscrupulous Government, and the dangerous power which so potent an engine as the Bank of England would confer upon them, had already been clearly foreseen by its antagonists at the time of its foundation, and had inspired them with a well grounded jealousy. We have seen that stringent precautions were taken in the first Act of 1694, to prevent the Bank making any advances to Government, without the express permission of Parliament. It had been the custom, however, time out of mind, to advance for the amount of such Treasury bills of exchange as were made payable at the Bank, to the amount of £30,000, when it was usual for the Treasury to send down orders to set off such advances against the accounts to which they properly belonged. If ever these advances reached £50,000, it was a subject of complaint. In the American war these limits had been much exceeded, and sometimes reached £150,000. Mr Bosanquet was Governor of the Bank in 1793, and the legality of such proceedings excited grave doubts in his mind, and after consulting with his brother directors, they agreed that it was a serious question, whether the penalties provided in the Acts did not extend to such transactions; they, therefore, thought it would be expedient to apply to the Government, to obtain an Act of indemnity, to relieve them from any penalties they might have incurred, and to permit such transactions, to a limited amount. Mr. Bosanquet, who conducted the negotiation with Mr. Pitt, expressly says that Mr. Pitt proposed to bring in a clause which should indemnify the directors to advance to a limited amount. He says that it was originally intended that the penalty should be taken off only in case the advance on Treasury bills should be restrained within a limited sum. This limited amount was intended to be fixed at £50,000, or £100,000. Mr. Bosanquet, however, then went out of office, and was unable further to attend to the negotiation. Mr. Pitt was much too keen not to see at once the enormous facilities Government would obtain if this Act were passed. Accordingly he pressed it quickly through Parliament, but he took care to omit any clause of limitation (Statute 1793 c. 38). Never had such a formidable engine been placed in the hands of a minister; he was now armed with an unbounded power of drawing upon the Bank, with nothing to restrain him, unless the directors should take the audacious step of dishonouring his bills. The Bank, henceforth, was almost entirely at his mercy, and then he plunged headlong into a reckless career of scattering English gold broadcast over Europe. In three years, upwards of £30,000,000 were remitted abroad. These great remittances had the inevitable effect of making the foreign exchanges adverse, and excited the greatest alarm in the Bank parlor. At the same time that this great drain of specie was going on, the Treasury bills increased to an unprecedented extent, and the demands for accommodation from the commercial world were equally pressing. Nothing could be more unpleasant than the situation of the directors, placed between these powerful parties,

contending for accommodation, which it was daily becoming less in their power to give. So early as the 11th December, 1794, the directors foresaw the ensuing pressure, and made representations to Mr. Pitt. In January, 1795, it became necessary to adopt a firmer attitude, and on the 15th they passed a resolution, that, with a foreign loan of six millions, and a home one of eighteen millions about to be raised, the Chancellor of the Exchequer must be requested to make his final arrangements for the year, without requiring further assistance from them, and more particularly that they could not allow the advances on Treasury bills, at any one time, to exceed £500,000. Mr. Pitt promised to reduce them to that amount, by payments out of the first loan.

117. He paid, however, little regard to these remonstrances, and, on the 16th April, they were compelled to remind him that he had not kept his promise that the sum should be reduced. They told him that they had come to a resolution that they would not in future permit the advances to exceed the stipulated sum. Mr. Pitt pretended that he had forgotten the circumstance, in the multiplicity of business, and promised that the sum should be immediately paid. Nevertheless, no reduction took place on the amount. Another remonstrance was equally ineffectual, and on the 30th July the directors informed him that they intended, after a certain day, to give orders to their cashiers to refuse payment of all bills, when the amount exceeded £500,000. Mr. Pitt was not prepared to comply with the request, and, on the 8th August, he applied to them for another advance of two millions and a half, but they refused to take his letter into consideration until he had made satisfactory arrangements with them for the repayment of the other advances. After some further communications, they agreed to the loan for £2,000,000.

118. The Act of Mr. Pitt had, in fact, deprived the directors of all power over the Bank. The foreign exchanges began rapidly to fall towards the end of 1794, and in May, 1795, had reached such a state of depression, as to make it profitable to export bullion; and this circumstance, as well as the knowledge that several foreign loans were in progress, should have warned the Directors of the necessity of contracting their issues; such was the course laid down by the Directors in 1783. Instead of that, their issues were greatly extended. In the quarter, from January to March, 1795, they stood higher than they had ever done before, though, no doubt, the Directors must be acquitted of the whole blame. The amount of their issues in August, 1794, was little more than ten millions; in February, 1795, it had increased to fourteen millions, though this was chiefly caused by the bills which were drawn on the Treasury on behalf of foreign governments, which were made payable at the Bank. The Directors had then to choose between endangering their own safety, or declaring the Government bankrupt.

119. These concurrent causes began to produce their full effects in the autumn of 1795. The drain commenced in September, and proceeded with alarming rapidity. On the 8th October, the Bank made a formal communication to Government, that it excited such serious apprehensions in their minds, that they felt it an absolute necessity

that the advances to the Government must be diminished. They detailed to him the various circumstances which alarmed them. Later in the month, rumours of a new loan reached the Directors; they waited on Mr. Pitt, who professed that he had not at present the most distant idea of one. On the 18th November, the Governor informed Mr. Pitt that the drain continued with unabated severity, and that the market price of gold was £4 2s. per ounce, and said that rumours were in circulation that another loan was intended, notwithstanding Mr. Pitt's denial of it so lately. Mr. Pitt said that, since their last interview, the successes of the Austrians had been so great against the French, that he was of opinion that it would highly conduce to the common cause, to aid them with another loan, not exceeding £2,000,000; but he added that if such a course would be hazardous to the Bank, every other consideration should be overlooked, and the loan abandoned.

120. This project of a loan going on, and being now proposed to be £3,000,000, the Court of Directors, after a very solemn deliberation, on the 3d December, came to the unanimous resolution, that if the loan proceeded they had the most cogent reasons for believing that very momentous and alarming consequences would ensue, from the actual effects of the last loan, and the continued drain of specie and bullion. In answer to this representation, Mr. Pitt solemnly promised them that he would lay aside all thought of it, unless the situation of the Bank should so alter as to render such a loan of no consequence to them.

121. The directors at last found that it was absolutely necessary to choose between making the Government bankrupt, and taking stringent measures to restrict their accommodation to the merchants. They resolved to fix beforehand the amount of advances they could make, day by day, and gave notice that if the applications on any day exceeded the sum so resolved to be advanced, a *pro rata* proportion of each applicant's bills should be returned, without regard to the respectability of the party, or the solidity of the bills.

122. As matters continued to get worse, the directors had several communications with Mr. Pitt, in January and February, 1796, but the project of the foreign loan being dwelt upon with much earnestness by Mr. Pitt, on the 11th of February, they came to a resolution that if any farther advances were made to foreign countries in the present state of affairs, that it would, in all probability, prove fatal to the Bank. They, therefore, earnestly deprecated any such measure, and protested against any such responsibility for the calamitous consequences that might ensue. Mr. Pitt treated this resolution with little attention, and, notwithstanding his solemn promises so frequently made, the directors discovered that clandestine remittances were still going on.

123. Under the influence of these combined drains of specie, the exchanges with Hamburgh were in a state of extreme depression during the first three months of 1796. Sir F. Baring shews that, during January, the profit was £7 10. per cent.; during February, £6 10s.; and during March, £8 7s. 6d. in transmitting gold to that place. At length the several drains began to diminish—an abundant supply of corn was obtained—the continued contraction of the Bank's issues, and the cessation of the transmission of

specie, caused the exchanges to assume a favorable aspect in the beginning of April, and it continued steadily to increase till February, 1797.

124. The stringent measures adopted by the Bank to contract its issues caused much complaint among mercantile men, and a meeting of bankers and merchants was held at the London Tavern, on the 2d of April, who resolved that an alarming scarcity of money existed in the City of London, which was caused chiefly, if not entirely, by an increase in the commerce of the country, and the great diminution of mercantile discounts by the Bank. They resolved that, if means could be found, to augment the circulating medium, without infringing the privileges of the Bank of England, so as to restore the amount to what it was before the contraction of discounts, it was the duty of every friend to trade to give such a plan the most earnest support. No result, however, attended this meeting.

125. Mr. Pitt had never fulfilled his promise, so often repeated to the directors, that the advances on Treasury bills should be reduced to £500,000. On the 14th June, 1796, they stood at £1,232,649. At the end of July he sent an earnest request to have £800,000 at once, and a similar sum in August. They were induced to consent to the first, but refused the second advance. Mr. Pitt said that the first advance without the second would be of no use to him, and begged them to reconsider their decision. The directors, thus pressed, were driven to assent to it, but they accompanied it with a most serious and solemn remonstrance, which they desired to be laid before the Cabinet. They said that nothing, under present circumstances, could induce them to comply with the demand, except the dread of a worse evil following the refusal; and they said that the advance would incapacitate them from granting any further assistance during the year. Nevertheless, Mr. Pitt made a fresh demand upon them, in November, for £2,750,000, on the security of the land and malt taxes of 1797, which was granted, on condition that the advances on Treasury bills, amounting to £1,513,345, were paid out of it.

126. Mr. Pitt took the money, but never paid off the bills. The directors again sent in on the 1st February, 1797, to demand payment of them, as they then amounted to £1,554,635, and would in a few days be increased by nearly £300,000 more. Mr. Pitt made many excuses for the non-payment, and promised to make an endeavour to do so, but he dropped a hint that another large sum of bills had come in from St. Domingo. Upon being pressed as to the amount, he said that it was about £700,000. The governor expressed the greatest apprehensions, and begged him to delay the acceptance as long as he could. Mr. Pitt then hinted that he should want a large sum for Ireland, which he said would be about £200,000. The governor assured him that the drain of cash had been continuous and severe of late, and that such a demand would be very dangerous.

127. The enormous failures of the country bankers in 1793, had been followed by a permanent diminution of the issues of the country banks to a large extent. Mr. Henry Thornton, after careful inquiry, came to the conclusion that they were diminished by one half, and that the wants of commerce had caused a very large

quantity of guineas to be drawn into the country, to supply their place. Meantime, though, in consequence of these circumstances, the exchanges had become favourable, the Bank had continued to adhere with the utmost severity to its policy of restriction; throughout the autumn of 1796, and during the last three months, they were no higher than they had been in 1782, with an amount of commerce many times larger than in that year. Commercial payments required to be made in some medium, in which the public had confidence. As the public could not get notes, they made a steady demand for guineas. The bullion in the Bank had been steadily diminishing during 1796, in December it stood at £2,508,000, when the drain began to increase greatly in severity.

128. The political condition of the country was now in a very critical state. Mr. Pitt's war-like combinations had totally failed, and England, which had commenced the war with all Europe almost in her alliance, now found herself alone, with nearly every state on the Continent, either in alliance with, or in subjection to, France. The Directory now determined to undertake the invasion of Ireland. The year 1797, commenced with the most gloomy apprehensions, and depression. The country bankers discerned that the first burst of the tempest would fall on them, and determined to provide for it, by obtaining as much specie as they could from London, and accordingly, the drain continued with increased rapidity after the beginning of the year. Mr. Pitt had hinted in his interview with the Governor of the Bank, on the 1st February, that a loan for Ireland would probably be required, which would probably not exceed £200,000, but soon afterwards the directors were struck with dismay on hearing that the amount required was £1,500,000. On the 10th February, the directors came to a resolution that before they could entertain any proposal for the Irish loan, the Government must pay off debts to them amounting to £7,186,445, which they specified.

129. At length the crisis came, and, as before, it began at Newcastle. A pressure had been going on there for some time. In addition to the manufactories and collieries, the number of troops stationed in that part of the country had been considerably augmented. The banks had imported an extra quantity of cash, to meet these demands, and were negotiating for more, when an event happened, which in the feverish state of the country, brought on a crisis. A French frigate ran into one of the Welch harbours, and landed 1,200 men. At the same time an order came down from Government, to take an inventory of the stock of the farmers, all along the coast, and to drive it into the interior, if necessary. These circumstances created a perfect panic among the farmers. On Saturday, the 18th February, being market day, the farmers, who at that time of year had the principal parts of their rents in their hands, actuated by the terror of an immediate invasion, hurried the produce of their farms into Newcastle, which they sold at very low prices, and immediately rushed to the different banks to demand specie. Seeing this universal panic, the banks came to an agreement to stop payment on the Monday, if it did not subside, which they accordingly did.

130. On the 21st February the state of the Bank became so alarming, that the Directors resolved that the time had come when they must make a communication to Government. The quantity of bullion had been rapidly diminishing, and the constant calls of the bankers from all parts of the town for cash, showed them that there must be some extraordinary reason for it. Mr. Pitt was aware that this proceeded from the general alarm of invasion, which he thought was magnified much beyond any thing to warrant it. It was agreed that a frigate should be sent over to Hamburg, to purchase specie. On the 24th February the drain became worse than ever, and inspired them with such alarm for the safety of the Bank, that they sent a deputation to Mr. Pitt to ask him, how long he considered that they should continue to pay cash, and when he should think it necessary to interfere. Mr. Pitt said it would be necessary to prepare a proclamation to put a stop to cash payments, and to give parliamentary security for the notes. But in that case it would be necessary to appoint a secret committee of the House, to look into the affairs of the Bank. The deputation assured him that the Bank would readily agree to this; and it was resolved to call a meeting of the chief bankers and merchants of London, to come to some resolution for the support of public credit in this alarming crisis.

131. The news of the stoppage of the Newcastle banks spread like wildfire throughout the country, and soon reached the metropolis. The drain upon the bankers now became a run; the first serious apprehensions that danger was imminent, were felt on the 21st February, when the drain greatly increased in severity, and on Saturday, the 25th, the cash was reduced to £1,272,000. Before this the Directors, in a state of utter bewilderment at the condition of the country, had used the most violent efforts to contract their issues. In five weeks they had reduced them by nearly £2,000,000. On the 21st January, they were £10,550,830, on the 25th February, they were £8,640,250. But even this gave no true idea of the curtailment of mercantile accommodation, for the private bankers were obliged for their own safety to follow the example of the Bank. In order to meet their payments, persons were obliged to sell their stock of all descriptions at an enormous sacrifice. The Three per cents. fell to 51, and other stocks in proportion.

132. On Saturday the 25th, the Court felt that the fatal hour was now come, when they must, for the first time since its institution, come to a total suspension of payments. A meeting of the Cabinet was held on Sunday, at Whitehall, and an order in council was issued requiring the Directors of the Bank of England to suspend all payments in cash, until the sense of Parliament could be taken on the subject.

133. The King next day sent a message to Parliament, to inform them of the step that had been taken, and recommended the matter to their most serious and immediate attention. Mr. Pitt moved that the message should be taken into consideration the next day, and that he should propose that a select committee be appointed to investigate the state of the Bank's affairs, which he believed were in the most solid condition.

134. The directors had the order in council

printed and widely circulated, and issued a notice of their own, to say that the general concerns of the Bank were in the most affluent and prosperous condition, and such as to preclude every doubt as to the security of the notes. At this time the cash in the Bank was reduced to £1,086,170.

135. The relief produced by the determination to suspend cash payments was instantaneous. The Directors, freed from the demand for cash, immediately extended their issues. In one week they were increased by nearly two millions. On the same day, a resolution was agreed to by 4,000 of the merchants in the City, to combine to support the credit of the notes.

136. Both Houses of Parliament appointed committees to examine into the affairs of the Bank. The Committee of the House of Commons reported that the outstanding obligations of the Bank, on the 25th February, were £13,770,390, and the total amount of their assets were £17,597,280, leaving a surplus of £3,826,890, over and above the debt of the Government, amounting to £11,686,800, which paid them three per cent.

137. Both Houses reported that it was advisable for the public interest, that the suspension of payments should be continued for a limited time, and a bill for that purpose was accordingly brought in. After some debate, which threw very little light on the subject, the Act (Statute 1797, c. 45) was passed. Its chief provisions were:—

1. A clause of indemnity to the Bank, and all connected with it, for anything done in pursuance of the order in Council.

2. The Bank was forbidden to make any payments in cash to any creditors, except in certain cases, and protected from all law proceedings.

3. The Bank might issue cash in payments for the army, navy, or ordnance, in pursuance of an order from the Privy Council.

4. The Bank was to make no advance above £6,000,000 for the public service, in cash or notes, during the restriction.

5. If any person deposited any sum, not less than £500, in gold, in exchange for notes of the Bank, it might repay three-fourths of the amount.

6. It might advance £100,000 in cash, to the bankers of London, Westminster, and Southwark, and to the Bank of Scotland, and the Royal Bank of Scotland, £25,000 each.

7. Payment of debts in Bank notes to be deemed as payments in cash, if offered and accepted as such.

8. No debtor was to be held to special bail, unless the affidavit stated that payment in bank notes had not been offered.

9. Bank notes would be received at par in payment of taxes.

10. The Bank might issue any cash it received since the 26th February, upon giving notice to the Speaker of the House of Commons, and advertising in the *London Gazette*, and on the Royal Exchange.

11. The Act was to be in force till the 24th June.

An Act was also passed to enable the Bank to issue notes below £5 (Statute 1797, c. 28), and by c. 32, this was extended to the country bankers, but they were to continue liable to pay money on demand for them, and in failure of doing so, within three days after demand, any

justice of the peace might cause the amount and costs to be levied by distress. An Act was also passed relating to the Scotch banks (*BANKING IN SCOTLAND*).

138. Such were the circumstances attending the suspension of cash payments by the Bank. An event of such portentous magnitude, and of whose effects there had been no previous experience, could not fail to give rise to the most conflicting opinions, as to the necessity of the measure, of the course of conduct of the Directors which led to it, and as to the policy which ought to have been adopted, under the drain which occurred in the last week of February, 1797. Having given a narrative of the chief facts here, we shall reserve a discussion upon it till we can consider the pathology of the principal commercial crises together. (*CRISIS, COMMERCIAL*.)

139. The presumed scarcity of guineas, which led to the supposed necessity of issuing the order in council, also rendered, a more abundant supply of the circulating medium necessary, and an Act was immediately passed, suspending till the 1st May, the Act (Statute 1775. c. 51), restraining the negotiation of small promissory notes. In a few days, the Bank caused to be prepared and issued £1 and £2 notes, and to supply still further the demand for a small currency, they issued a notice that they had imported a large number of Spanish dollars, which were to be current at 4s. 6d. However, it was discovered that the dollars were undervalued by 2d. each, and the directors then enhanced their current value by 3d.—these dollars were stamped with a small king's head—this was 1d. too high, and the directors having put these dollars into circulation at 1d. above their true value, the bullion merchants were not slow in seizing the advantage, and importing a large number of similar dollars, which they had stamped in a similar manner. They were all called in on the 31st October, 1797, by which time the Bank had put 2,325,099 into circulation. It at first attempted to refuse payment of the forged ones, but they were executed in so close imitation of the real ones, that it was impossible to detect them, and they were obliged to pay them all.

140. When the actual suspension took place, the foreign exchanges were highly favourable, so much so, as to make it profitable to import gold, which began to flow in in great abundance. On the 30th May, Mr. Manning stated in the House, that vast quantities of gold had flowed into the Bank, both from the country and abroad. The Government, however, and the directors of the Bank concurred in thinking that it would be imprudent to resume payments in cash, at the period when the restriction Act expired, and it was prolonged to one month after the meeting of the next session of Parliament.

141. Parliament met again on the 2nd November, and on the 15th, the House of Commons appointed a secret committee to enquire whether it was expedient to continue the restriction. On the 17th they reported that on the 11th of that month, the total liabilities of the Bank were £17,578,910, and their assets £21,418,460, leaving a balance in their favor of £3,839,550, exclusive of the Government debt of £11,686,800. That the advance to Government had been reduced to £4,258,140, while the cash and bullion were five

times the sum they stood at in February last, when the suspension was decided on, and much above what they had been at any time since September 1795. That the exchange with Hamburg was unusually favorable, and had every appearance of continuing so, unless political circumstances should affect it. That no inconvenience seemed to be felt by the bankers and traders of London, for whereas by law, they were entitled to demand three-fourths of any deposit in cash they might make, they had only actually demanded one-sixteenth. They presented a resolution of the directors, stating that the condition of the Bank's affairs was such, that it could with safety resume its usual functions. The committee, however, recommended, that in consequence of the state of public affairs, it was advisable that the restriction should be continued for a further period. After a short debate, an Act was passed to continue the restriction, until one month after the conclusion of a definite treaty of peace. In the course of the debate, Sir William Pulteney spoke with great ability against the national evils and inconveniences of the monopoly of banking by one company, and moved for leave to bring in a bill to establish another Bank, in case the Bank of England did not resume cash payments on the 24th June. Leave to bring in the bill was refused by a majority of 50 to 15.

142. The exchange with Hamburg at the time of the suspension of cash payments was 35-10, it continued to improve throughout the whole of that year, and in December stood at 38-5, which was about £13 per cent. above par. The issues of the Bank were about 11½ millions during the year. This extraordinary state of the exchanges continued during the whole of 1798, when they began gradually to fall, and in March, 1799, they were at 37-7, which was still £11 6s. above par. This was of course followed by a very great inflow of bullion, and at the end of 1798, the Bank had upwards of £7,000,000 in its vaults, and the directors expressed their readiness to the Government to resume payments in cash, the Ministry, however, thought it inexpedient in the state of the country.

143. The harvest of 1799 was lamentably deficient: it was even estimated that it did not exceed one half the usual average. By the end of the year wheat was at 94s. 2d. It continued to rise till in June, 1800, it stood at 134s. 5d., and remained at the end of the year at 133s. Under the influence of the enormous importations of wheat, the exchange with Hamburg continued to decline all through 1799, till in the last week of August, it had fallen to par. In December, 1800, it had fallen to 30s. In the meantime the price of foreign gold in coin, which had been at £3 17s. 6d. in May, 1797, rose to £4 in December, and continued at that price till September, 1799. In June, 1800, it rose to £4 5s., and in December, to £4 6s.

144. The arguments and ability of Sir William Pulteney, in advocating the foundation of another bank, produced great effect, and during 1799, it excited great public interest. Meetings were held for the purpose of promoting it, and numerous pamphlets were published on the subject. The Bank Directors took alarm, and they had the same solid arguments to advance as on former occasions, namely, a good supply of money. The

Ministry were of course in difficulties, and the charter had still 12 years to run, but upon advancing £3,000,000, without interest, for six years, Mr. Pitt agreed to renew it for twenty-one years from 1812. In 1800 a bill for this purpose was brought forward and passed.

145. The harvest of 1800 was, if possible, worse than that of 1799, and notwithstanding all the various measures recommended by Parliament, wheat rose in March, 1801, to 156s., barley to 90s., and oats to 47s. In the autumn of 1799, failures of great magnitude took place at Hamburg; 82 houses came down, with liabilities amounting to £2,500,000. In consequence of these, discount rose to 15 per cent. Under the influence of the enormous sums of money that had to be sent abroad in purchase of grain, the attraction of this high rate of discount, there being no power on this side to raise the rate of discount to counteract it, and other causes, the exchange on Hamburg, which had stood so high for several years, fell in January, 1801, to 29s. 8d., being upwards of 14 per cent. against England, and the market price of gold bullion (i.e., the price when paid in bank notes) was, as we have seen, £4 6s.

146. In the great monetary crisis of 1696-7, it was universally acknowledged by Parliament, and the most eminent merchants, that it was the bad state of the coinage which produced the great rise in the market price of bullion, and the heavy fall in the foreign exchanges; and we have seen that the restoration of the coinage immediately rectified the exchange. At that time bank notes were not a legal tender, and the language invariably applied to them, when their current value differed from their nominal value, was that they were at a discount. When the men of that day saw that the bank notes were a promise to pay so many "pounds" on demand, and when they saw that the persons who issued them were unable to pay that number of pounds, and that no one would give that number of pounds for them, they never used any other expression regarding these facts, than that the notes were at a discount. There is no trace of any one having thought of saying that it was the notes that denoted the pound sterling, and that bullion had risen. When the reform of the coinage took place, and the exchanges were simultaneously rectified, it was said that the reform of the coinage *caused* the restoration of the exchange, and numerous merchants had written pamphlets to combat a delusion which was rather prevalent among some persons, that bullion as a commodity could have a different value to bullion as coin, except on account of the depreciation of the coinage. And it was clearly understood by them, that the exchange never could vary but very little beyond the cost of the transmission of specie.

147. Such were the truths established when a metallic currency was the only one thought of in estimating value. But at this time a new principle was introduced—there was what was substantially an inconvertible paper currency. At this time most men's ideas were transferred from the metallic currency to the paper currency. Ever since the issue of £1 notes, people thought of them when they spoke of prices, as being so many pounds. When the suspension of cash payments took place, there was a general expectation that Bank notes would be depreciated, but the general

resolution of bankers and merchants to support the credit of the bank, the determination of government to receive bank notes in payment of taxes at their par value, and the great caution exercised by the directors during the first few years after the restriction, had removed all these apprehensions, and for some years bank notes circulated at par.

148. At this time, however, phenomena occurred, which directed the attention of many persons to the state of the paper currency. The market price of standard gold up to September, 1799, had continued at £3 17s. 6d. per oz., and the price of foreign gold in coin had been somewhat higher, on account of its greater use as coin, than as bullion. But in June, 1800, the price of foreign gold experienced a sudden and extraordinary rise; it rose to £4 5s. per ounce, silver rose to 5s. 7d. per ounce, and the foreign exchanges fell below par. In January, 1801, gold and silver were each 1s. per ounce higher, and the Exchange on Hamburg was at 29.8, being a depression of 14 per cent. below par. But the expense of transmitting specie to Hamburg was estimated not to exceed 7 per cent., and consequently there remained a difference of 7 per cent. to be accounted for.

149. It was at this time, that the great and palpable truth was discovered, that if a deterioration of the coinage produced a rise of the market price of bullion above the mint price, and a fall in the foreign exchanges, under a metallic currency, then that the converse proposition was also necessarily true. That under a paper currency, which was only the representative of a metallic currency, if the market price of bullion, (i.e. the paper price) exceeded the mint price, and the foreign exchanges fell, beyond the cost of the transmission of bullion, that excess could only arise from the *depreciation* of the representative of the metallic currency, and therefore when these circumstances occurred, THEY INFALLIBLY INDICATED THAT THE PAPER CURRENCY WAS DEPRECIATED.

150. We are not certain to whom the merit of the discovery of this great and important truth is due. There is a passage in John Law, which clearly shows that he would have immediately acknowledged it, and is by far the earliest passage that we are aware of, that indicates the connection between the paper currency and the foreign exchanges (LAW). Mr. Boyd, Mr. Henry Thornton, and Lord King, the last especially, were, as far as we can discover, the persons to whom its establishment at this particular period is due, (BOYD, THORNTON, KING) and therefore we have called it Lord King's law, though we are not certain, whether strict justice does not demand that it should be attributed to John Law. However that may be, this law is the fundamental one, on the subject of the paper currency and the foreign exchanges.

151. The definitive treaty of peace with France was signed on the 27th March, 1802. The restriction on cash payments expired of itself, six months after that event, but though the bank declared that its coffers were well supplied with specie, and that it was anxious and ready to resume payments in cash, the Chancellor of the Exchequer, Mr. Addington, brought in a bill on the 9th April, 1802, to continue the restriction till

the 1st March 1803, which was passed. The arguments alleged in favor of this measure show a wonderful decline in financial knowledge in the government of 1802 compared to 1696. At the latter period the great *reason* alleged for the reformation of the coinage, was the adverse condition of the foreign exchanges, and the rise of the market above the mint price, caused by a depreciation of the currency. (COINAGE, MINT PRICE). We have shown the triumphant success of the re-coinage, which restored the public credit and the exchange. The sagacity of a Montague could at once have seen that the adverse state of the exchange, and the high price of bullion, were entirely owing to the depreciated state of the currency, and that the only method of restoring them to par, was the immediate resumption of cash payments. So great, however, was the ignorance upon the subject, that the fact of the exchange being adverse, was the very reason alleged why cash payments should *not* be resumed. Mr. Addington, in bringing in the bill, said, "It cannot be necessary for me to inform the House, that the rate of exchange between this country and foreign parts, is disadvantageous to ourselves—that the export trade has been for some months at a stand, that while the rate of exchange is disadvantageous to us an *augmentation of the circulating cash* would create a trade highly injurious to the commerce of this country. *For several months past, there has been a trade carrying on for the purchase of guineas, with a view to exportation.* It is on these grounds that I submit to the House the expediency of continuing the restriction with regard to the cash payments of the Bank." Why, these were the very reasons why a return to cash payments should have been made without delay. The reason why the trade in buying up guineas was going on, was just because of the abundant quantity of paper, the paper "promises to pay" were falling in value as compared to the guineas, and as a necessary consequence, guineas were exported, and so far from a return to cash payments augmenting the circulating medium, it would infallibly have considerably diminished it, by making the Bank reduce its paper issues. It was because the prices of articles were so high in this country, that the export trade was unprofitable, and a reduction of the issues would infallibly have compelled such a reduction in prices, as would have facilitated the export.

152. The result of this extraordinary amount of financial error could have been easily predicted. The circumstances of the country did not improve, as the ministry had taken the most effectual measures to prevent them doing so. In February, 1803, Mr. Addington had to come forward again, to prolong the restriction. He said that the reasons which suggested it were too strong, and the necessity too urgent to be resisted. The restriction was continued last session, because the exchanges were adverse—the exchange with Hamburg was then at par—that with Amsterdam adverse. Upon these grounds he said it was expedient to continue the restriction, until the progressive advance of our commerce should produce such a steady inclination of the exchange in our favor, as to render it safe to resume cash payments. That the scarcity of the last three years had made it necessary to export twenty

millions of bullion in payment of corn, and until that came back cash payments could not be resumed. Mr. Fox said that such a mode of arguing went to establish it as a general axiom that, whenever the exchanges were adverse, cash payments of the bank ought to be suspended; and then he touched the right point: "Perhaps, even, it might happen that the unfavorable turn of the exchange against this country *might be owing to the very restriction on the bank*;" and he quoted the instance of 1772, when there was a great quantity of bad money in the country, and the exchange was adverse; but as soon as the good coinage was issued, the exchanges turned in our favor; exactly we have already seen, as was the case in 1696. Mr. Fox pointed out that the same was the case then, *because paper is not much better than bad gold*. This truth was not followed up, and while the Directors of the Bank alleged that they were perfectly able to resume cash payments, the ministry enforced a continued restriction on them, for political reasons, until six weeks after the beginning of the next session of Parliament. In the Lords, Lord Pelham said that the idea of renewing the restriction at the present moment originated solely with the government, who had had no communication with the Bank on the matter. The great truth hinted at by Mr. Fox, was much more strongly and fully stated by Lord King and Lord Moira in the House of Lords. The ministry complained that the importation of bullion was hanging fire; was it not plain that the reason was that its value in this country was depreciated by the plethora of paper? and the true way to attract it was by diminishing the quantity of the paper, and so raising the value of the gold. The bill was carried without a division.

153. The resumption of the war in 1803, rendered any idea of resuming cash payments out of the question, and the inevitable consequences of an excessive issue of paper followed; people began to hoard their guineas. The Chancellor of the Exchequer denounced the people who did so, as wanting in public spirit. Precisely the same language had been held in the tribune of the French Convention regarding assignats. The debate in the Lords produced some excellent speeches, among others Lord King enunciated the true principle regarding the regulation of a paper currency, "*A very strict attention to the price of bullion, and the state of the foreign exchanges, was alone capable of affording a just criterion, by which the quantity could be truly ascertained.*" (KING, LORD).

154. At this time the depreciated state of the Irish currency strongly attracted the attention of Parliament, and a committee was appointed in 1804. We have, in its proper place, given some account of the proceedings of this committee (BANKING IN IRELAND), and merely notice it here as the first occasion on which a Parliamentary Committee enunciated the doctrine, that the issue of paper currency should be regulated by the foreign exchanges. It was on this occasion, too, that the doctrine which was afterwards maintained with such pertinacity in this country, was first put forward, that it was not the bank note that had fallen to a discount, but the value of gold that had risen.

155. In this year the scarcity of the silver coinage was so severely felt that the bank issued 5s. dollars to supply the want, of which 1,419,481 were put into circulation. In 1806 the loan of three millions, which was the consideration for the renewal of the Charter in 1800, became due. But the Bank was persuaded to renew it at 3 per cent. per annum until six months after the ratification of peace. In 1807 a committee was appointed to inquire into the various branches of the public expenditure, and amongst others into the payments made into the Bank of England. In the second report are some interesting details respecting the connection between the Bank and the government.

156. It was in 1806 and the following years, that the circumstances occurred, which were the origin of that great derangement of the currency which was the occasion of the appointment of the Bullion Committee. Owing to the shutting up of the continental ports by the Berlin decree, a degree of scarcity was expected in the raw material of our manufactures which came from the North of Europe. A violent speculative fever immediately commenced in these articles. Difficulties also with America, in consequence of the absurdity of our own orders in Council, raised the price of the raw produce of that country in an equal degree. At the same time, the throwing open of the markets of South America seemed to give a boundless demand for manufactured goods. Speculation, thus aggravated by so many concurring causes, swelled up in proportion to the magnitude of the markets thrown open. A complete phrenzy seized the nation. It spread from commerce to Joint Stock Companies. The infatuation of 1720 was reproduced. Joint Stock Companies of all descriptions—for canals, bridges, insurances, breweries, and multitudes of others—started up like mushrooms. At the same time the Bank of England fanned the flame of speculation to an extent far beyond the bounds of ordinary rashness. It is stated by Sir Francis Baring, in his evidence before the Bullion Committee, that since the restriction, he knew of many instances of clerks not worth £100 who had started as merchants, and had been allowed to have discount accounts of from £5,000 to £10,000, which demand, he said, was caused by the Bank, and not by the regular demands of trade, and which could not exist if the restriction was removed. The paper discounted by the Bank, which had been £2,946,500 in 1795, rose to £15,475,700 in 1809, and to £20,070,600 in 1810.

157. Along with this extravagant speculation, partly caused by it, and partly fanning it, a multitude of country banks started up in all directions, and inundated the country with their notes, exactly as had happened before 1793. In the year 1797 they had been reduced to 270; in 1808 they had increased to 600; and in 1810, when the Bullion Committee were appointed, they amounted to 721, and the quantity of paper they had put into circulation was supposed to amount to £30,000,000. At the same time the Bank of England had increased its issues to £21,000,000, a quantity declared by some of the most eminent witnesses, far to exceed the legitimate wants of the country.

158. Concurrently with these extravagant

speculations and issues of notes, the price of gold bullion rose rapidly, and the foreign exchanges fell in an equal degree, exactly the same symptoms as had been manifested in Ireland in 1804. Specie totally disappeared from circulation. J. Say says that upwards of £9,000,000 in guineas was smuggled over, and landed at the Belgian ports. Standard gold, which had been £4 per ounce since 1806, rose to £4 10s. in February, 1809, and to £4 13s. in January, 1810. Silver rose from 5s. 4d. to 5s. 7d. the ounce, and the Exchange with Hamburg, which was at 35·6 in January, 1806, gradually fell through the succeeding years till it reached 28·6 in January, 1810. Mr. Baring stated that guineas then brought 26s. and 27s. Under these circumstances, Mr. Horner, on the 1st February, 1810, moved for several returns relating to currency and exchanges. And on the 10th, the Bullion Committee were appointed.

159. As we have given a full analysis of this celebrated Report in its proper place (**BULLION REPORT**), we shall say no more about it here, further than this, that what Mr. Fox had called the fantastical doctrine that *it was not the note which had fallen, but gold that had risen*, seemed to have taken possession of the immense majority of mercantile men, and they almost all repudiated the idea that the issues of bank notes had anything to do with the foreign exchanges. Nevertheless the Committee came exactly to the same conclusion that the Committee of 1804 had done in the Irish case, that the depression of the foreign exchanges was owing to the excessive issues of bank notes, and that the latter were at a heavy discount. They laid down a series of propositions regarding the currency and monetary system (**BULLION REPORT**), which they proposed for the adoption of the House, and they said that these overissues of the bank could only be cured by a resumption of cash payments, which they recommended should take place within two years from that date. The resolutions were brought before the House in 1811, and the first was negatived by a majority of 151 to 75, the fourteen next were negatived without a division, and the last, recommending a resumption of cash payments within two years, was rejected by 180 to 45.

160. No sooner was the Bank freed by this ministerial triumph from all fears of restraint than it began to issue its notes with greater profusion than ever. In March, 1812, the market price of gold was £4 16s., or, more truly, the bank note had fallen to 16s. 3d., and Lord King issued a circular to several of his tenants reminding them that their contract was to pay a certain quantity of the legal coin of the country, and that the present paper currency was considerably depreciated. He said that in future he should require his rents to be paid in the legal gold coin of the realm, but that as his object was merely to secure the payment of the real intrinsic value of the sum stipulated by agreement, he should be willing to receive the amount in Portugal gold coin, of an equal weight with that of the stipulated number of guineas, or by an amount of bank notes sufficient to purchase the weight of standard gold requisite to discharge the rent.

161. In fact, the insane vote of the House of Commons made the value of every man's pro-

perty dependent on the will of the Bank Directors. This was fraught with the most alarming consequences to every one who had a fixed income, as whilst the price of every article of prime necessity kept pace with the depreciation of the currency, any one like a landlord having only a fixed rent to receive, was paid in a depreciated paper, while his tenants received the increased nominal prices of their commodities. That Lord King's demand was legal no one pretended to deny; but when this practical sarcasm was passed upon the resolution of the House of Commons, it excited the vehement hostility of the ministerial party, and the most unmeasured abuse was heaped upon him for incivism. Lord Stanhope brought in a bill making it a misdemeanour to make any difference between guineas and bank notes. He said that he had been informed of many instances in which a £1 note and seven shillings had been demanded for a guinea, in which he was confirmed by Lord Holland. Admirable commentary upon the resolutions carried so triumphantly in the House of Commons only two months before, and then standing on their journals, that in public estimation guineas and bank notes were equal!

162. The following harvest was extremely deficient, and the price of corn began rapidly to rise until August, 1812, when the average was 155s. in England and Wales, and some Dantzic wheat brought 180s., and oats actually touched 84s. The market or paper price of gold continued to rise till November, 1813, when it stood at £5 10s., the value of the bank note being 14s. 2d. The long continuance of high prices, partly caused by a series of bad harvests, and partly by the depreciation of the paper in which they were paid, gave rise to the belief that they would be permanent. Immense speculations began in land jobbing, and vast tracts of waste and fen land were reclaimed. Rents in most cases rose to treble what they were in 1792; all the new agricultural engagements entered into at this period were formed on the basis of these inflated prices. Landlords and tenants increased their expenditure in a like proportion, and family settlements were made on a commensurate scale. As a natural consequence, country banks greatly multiplied. In 1811 they were 728, in 1813 they had risen to 940, and the amount of their issues was supposed, on the most moderate estimate, to be about £25,000,000. After the disasters to the French armies, in the campaigns of 1813, the ports of Northern Europe were thrown open to British commerce, which naturally gave rise to enormous speculative exports and overtrading.

163. The harvest of 1813 was prodigiously abundant, so that the price of corn which in August, 1812, had been 155s., rapidly fell; and in July, 1814, was only 68s. The exporting speculations were at their height in the spring of 1814, and the prices of all such commodities rose to a very unusual height. Every branch of industry was affected by these causes, and the natural and inevitable consequence soon followed—a violent revulsion and general depression of prices of all sorts of property, which entailed such general and universal losses and failures among the agricultural, commercial, manufacturing, mining, shipping, and building interests, as had never before been paralleled. As is always the case,

the consequences of the wild speculations and engagements persons had entered into during the continuance of the fever, continued to be felt for some years afterwards. The disasters commenced in the autumn of 1814, continued with increasing severity during 1815, and reached their height in 1816-17. During these years eighty-nine country bankers became bankrupt, and the reduction of the issues of country paper was such, that in 1816, its amount was little more than half what it had been in 1814.

164. This general discredit of country bank paper, resembling what had previously occurred in 1793 and 1797, caused a demand for additional issues from the Bank of England to help to maintain public credit; and though this caused an extension of the Bank paper by upwards of £3,000,000, so great was the abstraction of country issues from circulation, (to certainly three times the amount of the Bank of England issues,) that the value of the whole currency rose, so, that while in May, 1815, the market, or paper, price of gold was £5 6s., the exchange on Hamburg 28-2, and that on Paris 19, in October, 1816, the paper price of gold had fallen to £3 18s. 6d., the exchange on Hamburg was 38, and that on Paris 26-10, and they remained with little variation at these figures till July, 1817.

165. Hence, at length, was manifested the most complete triumph of the principles of the Bullion Report. The great plethora of this worthless quantity of paper currency being removed, the value of the whole currency was raised almost to par; so near, in fact, that the smallest care and attention would have brought it quite to par; and it was indeed said, that the price of gold at this period would actually have fallen to its natural level, if the Directors of the Bank had not chosen for particular reasons to give more than they need have done.

166. And we must beg our readers to impress this fact indelibly on their minds, because a whole host of writers, whose ignorance of science can only be matched by their gross ignorance of facts, have maintained that it was the Act of 1819 which caused a violent disturbance in the relative value of the Bank Note and coin; whereas the true fact is, *that the great restoration of the value of the paper currency to par took place in 1816, from the operation of natural causes, and not from any Act of Parliament whatever.*

167. We have seen that on several previous occasions the Bank had intimated to the government their perfect readiness and ability to resume payments in cash, but had always been prevented from doing so for political reasons. In 1815, when peace was finally restored, they prepared in good faith to be ready to do so, as soon as they should be required; and during that year and 1816 they accumulated so much treasure, that, in November, 1816, they gave notice of their intention to pay all their notes dated previously to the 1st January, 1812; and in April, 1817, all their notes dated before the 1st January, 1816. When this was done there was found to be scarcely any demand upon them for gold. The nation had got so accustomed to a paper currency, that they were most unwilling to receive gold for it. Mr. Stuckey, one of the largest bankers in the West of England, said that during this partial

resumption of cash payments, it cost him nearly £100 to remit the surplus coin which accumulated upon him to London, as he could not get rid of it in the country, his customers all preferring his notes; many persons who had hoarded guineas requested as a favor to have notes in exchange.

168. In March, 1815, the restriction was prolonged to July, 1816. The bill was brought in and passed before the news of Napoleon's quitting Elba had reached England. The Act was scarcely passed when the new war broke out, which ended at Waterloo, and the expenses of the campaign made the ministry dread a monetary crisis, and the restriction was subsequently prolonged to July, 1818.

169. The partial resumption of cash payments was attended with perfect success; it caused no very great demand for gold, which continued to accumulate in the Bank till October, 1817, when it reached its maximum, being £11,914,000. In that month, the Bank gave notice that it would pay off in cash all the notes, dated before the 1st January, 1817, or renew them, at the option of the holder. In the course of 1817 a very large amount of foreign loans were contracted for; Prussia, Austria, and other continental states of lesser importance, were endeavouring to replace their depreciated paper by a metallic currency, and as money was abundant in England, a very large portion of these loans was taken up here. The effect of this began to manifest itself in April, 1817, when the exchanges with Hamburg and Paris began to give way, and the market price of gold to rise. These phenomena increased gradually throughout 1818, until in January, 1819, the price of gold was £4 3s., the exchange on Hamburg 33-8, and that on Paris 23-50. In July 1817, the new gold coinage began to be issued from the Mint in large quantities. The consequence was, a steady demand for gold set in upon the Bank, and, in pursuance of its notices, the sum of £6,756,000 was drawn out of it in gold. Just at this time the British Government reduced the rate of interest upon Exchequer Bills. The much higher rate of interest offered by continental governments caused a great demand for gold for exportation, and in the beginning of 1818 a very decided drain set in. The Bank Directors, however, determined to set all the principles of the Bullion Report ostentatiously at defiance. While this great drain was going on, they increased their advances to government from £20,000,000 to £28,000,000, and though they perfectly well knew that the demand for gold was for exportation, they took no measures whatever to reduce their issues for the purpose of checking the export. At the same time the issues of country banks had increased by two-thirds since 1816.

170. This demand for gold became more intense during 1818 and the beginning of 1819, and it became evident that the Bank would soon be exhausted, if legislative interference did not take place. Accordingly, on the 3rd February, 1819, both Houses appointed committees to inquire into the state of the Bank; and on the 5th April they reported that it was expedient to pass an act immediately to restrain the Bank from paying cash, in terms of its notices of 1816-17. An act for that purpose was passed in two days. It was stated in the report of the

Commons, that in the first six months of 1818, 125 millions of francs had been coined at the French Mint, three-fourths of which had been derived from the gold coin of this country. The Act, Statute 1819, c. 23, forbade the Bank to make any payments in gold whatever, either for fractional sums under £5, or any of their notes, during that session of Parliament. Thus the Bank was totally closed.

171. The most remarkable thing, however, connected with these investigations, was the entire revolution in opinion that had taken place in the minds of mercantile men regarding the true principles of the currency. In the committees of 1804 and 1810, the immense preponderance of commercial opinion was entirely adverse to the doctrine that the issues of paper currency had any effect on the Exchanges, or the price of bullion, or should be regulated by them. Nevertheless the reports of both committees were entirely in the teeth of the mercantile evidence. The Bullion Report had now been before the country for nine years, and had caused more public discussion, both in parliament and the press, than almost any subject whatever; and it is perfectly manifest that, if its principles were erroneous, the commercial world would only have been further strengthened in their opposition to them. But what was the result now? The overwhelming mass of commercial evidence was entirely in their favour. The current of mercantile evidence was now just as strong on their side, as it had formerly been against them. Merchant after merchant, and a long series of Bank Directors, came forward to avow their entire concurrence in them. What could be more triumphant than this? What could be more splendid testimony to their accuracy and soundness, than the fact that they had converted the immense hostile majority of the commercial world—a memorable example that statesmen and men of general education, though they should always receive statements of fact with the utmost deference from “practical” men, should never let their judgment be subjugated by the opinions of such persons, but should always assert an independent right to apply the principles of general reasoning to these phenomena, as well as to all others.

172. The old opinions of the mercantile witnesses of 1810 were now so thoroughly exploded that they had scarcely a voice in their favour. There was only one body of men who still adhered to the old opinions—the majority of the Court of Directors of the Bank of England. Notwithstanding that the Governor and Deputy-Governor, and a large number of other Directors had entirely adopted the opinions of the Bullion Report, on the occasion of some questions being sent for their consideration by the Committee of the House of Commons, the Court took the opportunity of recording publicly their disapproval of the doctrines which were now in the ascendant. On the 25th March they resolved, “That this Court cannot refrain from adverting to an opinion strongly insisted upon by some that the Bank has only to reduce its issues to obtain a favourable turn in the exchanges, and a consequent influx of the precious metals; the Court conceives it to be its duty to declare that it is unable to discover any solid foundation for such a sentiment.” Thus

we see that the very body of persons in the country who, it was, above all others, important should be guided by true principles, and upon whose action so mighty public interests rested, were the very persons who prolonged the exploded errors for years after every other sane man in the country had adopted the true views.

173. The report of the Lords' Committee contented itself with recording the opinions of the different witnesses upon the great question so long agitated, it pronounced no judgment of its own upon the soundness of the different views. It was, however, very decided in its recommendation to return to the ancient metallic standard as speedily as could be done, with a due regard to the interests of commerce. The Committee of the Commons expressed their opinion, that when the exchanges became unfavourable, and the market price of gold rose above the mint price, the only mode in which the Bank could have retained the coin in circulation, was by contracting their issues. And they said that however the exchanges might have been affected during the last and preceding year, they had no reason to apprehend the same or any other causes could continue to affect them in such a degree as to preclude the Bank of England, by a constant reference to the exchanges and the price of gold, and, when necessary, by a cautious reduction of their paper currency, from gradually approximating its value to that of gold, and ultimately re-establishing and maintaining it at par. Both Houses agreed in recommending that after the 1st February, 1820, the bank should be required to deliver gold of standard fineness in quantities of not less than sixty ounces, at £4 1s. per ounce; but that after the 1st October, 1820, the rate should be reduced to £3 19s. 6d., and after the 1st May, 1821, it should be reduced to the mint price of £3 17s. 10½d. per ounce, that this liability to pay in bullion should continue for not less than two, nor more than three years from 1st May, 1821, when payments in cash should be resumed. They also expressed their opinion that the great destruction of country bank paper in 1816-17 had been partly instrumental in reducing the price of gold, and making the exchange favourable during that period. That from the numerous circumstances affecting the value of Bank of England paper—the varying state of commercial credit and confidence—the fluctuations in the amount of country bank paper, and other reasons, no satisfactory conclusion could be drawn from the mere numerical amount of their issues at any given time.

174. It was not to be expected that the principles of the Report should command the universal assent of so large a body as the commercial world of London, many of whom, though no doubt excellent men of business, in their own particular lines, could not be expected to have much scientific knowledge of such subjects. Accordingly a petition was signed by about 500 merchants, bankers, and others, and also one by the Directors of the Bank of England. These, however, had no effect upon either House of Parliament. After debates in both Houses, which well deserve the attentive study of all students in Political Economy, the bill which was introduced into the House of Commons by Mr. Peel, the chairman of the Committee, passed both Houses, without a dissentient

voice—Mr. Canning in the House of Commons declaring, amidst loud and general cheering, that it was the unanimous determination of Parliament that the country should return as soon as possible to the ancient standard of value, in the establishment of a metallic currency; and Lord Liverpool in the Lords said that the bill had met with no opposition, and required no defence. The chief provisions of this Act, Statute 1819, c. 49, were—

I. The Acts then in force for restraining cash payments should be continued till the 1st May, 1823, when they were finally to cease.

II. That on and after the 1st February, and before the 1st October, 1820, the Bank of England should be bound, on any person presenting an amount of their notes, not less than of the value or price of sixty ounces, to pay them on demand, at the rate of £4 1s. per ounce, in standard gold bullion, stamped and assayed at the Mint.

III. That between the 1st October, 1820, and the 1st May, 1821, it should pay in a similar manner in gold bullion, at the rate of £3 19s. 6d. per ounce.

IV. That between the 1st May, 1821, and the 1st May, 1823, the rate of the gold bullion should be £3 17s. 10½d. per ounce.

V. During the first period above mentioned, it might pay in gold bullion, at any rate less than £4 1s., and not less than £3 19s. 6d. per ounce; in the second period, at any rate less than £3 19s. 6d., and not less than £3 17s. 10½d., upon giving three days' notice in the *Gazette*, and specifying the rate; but after doing so they were not to raise it again.

VI. These payments were to be made in bars, or ingots, of the weight of 60 oz. each, and the Bank might pay any fractional sum less than 40s. above that in the legal silver coin.

VII. The trade in gold bullion and coin was declared entirely free and unrestrained.

In conjunction with this Act, a most salutary measure was passed (Statute 1819, c. 76) to put a stop to the evil which the Bank directors themselves alleged had brought about the catastrophe of 1797, namely, the enormous sums the government had been in the habit of demanding from the Bank by way of advances, without any parliamentary security, which Mr. Pitt had so grossly abused. By this Act the Bank was forbidden to make any advances of any description, without the express and distinct authority of Parliament for that purpose first had and obtained.

175. Thus we must beg our readers carefully to observe the cautious and deliberate manner which Parliament adopted to bring about a permanent restoration of the true measure of value, a metallic currency. They even sanctioned a species of bankruptcy for a reasonable period, in order not to make the change too violent. And yet numbers of writers and speakers at the present day declaim against the violence and injustice of the Act of 1819, as if it had caused a violent and abrupt reduction in the value of the Bank Note. Such statements can only proceed from the most shameful ignorance of the facts of the case, or from the most shameful and wilful dishonesty. The abrupt and violent restoration of the Paper Currency to par took place in 1816, and not in 1819, as we have already shewn, and was not produced by any law whatever. The

Bank resumed partial payments of its currency in 1816, and was rapidly proceeding to a total resumption of cash payments, when the monetary disturbances of 1818 took place; and it was only the mismanagement of the directors, and their deliberate violation of the true principles of monetary science, that brought about the stoppage of 1819. And ultimately the Bank resumed cash payments in full, of its own accord, two years before the time limited by law.

176. This great Act for the preservation of the national good faith, the restoration of the measure of value, was accomplished with the unanimous consent of every man of sound judgment. But, unfortunately, no sooner had it become law, than an unusually severe and long continued disturbance in the ordinary proportion of supply and demand in a great variety of productions took place. The violent fluctuations in prices which necessarily followed this great derangement, caused much public distress, and afforded an opportunity for the antagonists of the Act of 1819 to acquire such strength, as to induce the government to tamper with the Act, before it came into full effect.

177. The utter prostration of all the great producing interests of the country in 1815-16, had caused such severe distress, as to diminish the consuming powers of the people to an enormous extent. The importation of the great articles of consumption in 1816, were in most cases not half what they had been in 1814. In 1817, when the general prosperity was reviving, the shortness of the supply caused a very general and rapid rise in the prices of all commodities. The inevitable consequence followed, speculation began to revive again, and was much fostered in 1818, by an expected dearth of provisions. The crops were supposed to be irretrievably damaged, and as imported produce was remarkably low, the prices of all sorts of farming produce rose to an extravagant height. The home crop of wheat turned out much better than was expected, and great importations of that cereal took place; but all other sorts of farming produce mounted up to a great height, barley being at 63s. 6d., oats at 35s., beans at 76s., and peas at 79s., in December, 1818. These extravagant prices of course attracted enormous importations at the close of 1818. The imports of colonial and foreign produce, retained for home consumption, were more than double what they were in 1816. During the winter, the enormous importations of foreign produce arrested the rise in prices, and as they further continued, a decided fall began to manifest itself, which was in progress when the Act for the restoration of cash payments passed.

178. The usual consequences followed these extravagant importations. Importers, trusting to the prices of 1817, had given orders to the growers based upon these prices, and when the crops came to be brought to market, the price had given way. Failures accordingly were numerous in 1819, both in England and America, the necessary consequence of a transition from high prices caused by scarcity, to low prices arising from excess of supply. Towards the autumn of that year commercial credit had revived. The great importations of wheat in 1818 somewhat reduced the price in 1819, but it stood at 75s. in August, and the average of the whole year was 72s. This

price continued, with a few fluctuations, till August, 1820, and at that time wheat was still at 72s. A decided and unanswerable proof that the discussions in Parliament, and the Act for the resumption of cash payments, had no effect at all on the price of corn. Although the Bank was permitted to pay its notes in gold at the rate of £4 1s. per ounce, yet they were actually at par, as the market price of gold fell to £3 17s. 10½d. in August, 1819, and continued at that rate till June, 1822, when it fell to £3 17s. 6d.

179. The price of wheat in July, 1820, was still 72s., but the weather having been most propitious, the harvest was of most extraordinary abundance and of excellent quality. And even its unprecedented exuberance did not become fully known till two or three years afterwards, when it was not yet exhausted. The best authorities calculated that the quantity of the crop of 1820 was one-third above the average. In July, 1821, wheat had fallen to 51s. from 72s. in August, 1819. In September it had risen to 62s., but in consequence of the wet weather, though the quantity was very large, the quality was very bad. In consequence of the enormous unexhausted stock of 1820, wheat fell to 50s. at the end of 1821, and to 42s. in August, 1822. The harvest of 1822 was remarkably good, both in quantity and quality, and was got in early, long before the preceding crops had been consumed. Besides this, the importations from Ireland were on an unprecedented scale. In 1817 corn was obliged to be exported to Ireland, in 1820 and 1821 Ireland exported to England upwards of 4,000,000 quarters of grain of all sorts. The natural and inevitable consequence of this was an immense and ruinous fall in the prices of all agricultural produce. Wheat fell to 38s. at the end of 1822.

180. The accumulation of treasure became so rapid in the vaults of the Bank in 1820, that early in 1821, the directors felt themselves in a position to resume cash payments, and an Act was passed to permit them to do so on the 1st May, 1821, instead of in 1823. By this time the Government had repaid £10,000,000 of the debt it owed to the Bank, which all the witnesses agreed was a necessary preliminary to enable the directors to contract their own issues. The Statute 1821 c. 26, enacted that the Bank might resume payments in gold coin on the 1st May, 1821. That persons offered to be paid in coin should not have the right to demand ingots; but if the Bank did not offer to pay in coin, the right to demand ingots should continue. The last impediments to the export of bullion were swept away. The Bank was bound to exchange its larger notes for any one who demanded it for £1 notes or gold coin, but they had the option of paying in notes or gold.

181. The extravagant height to which the combined effects of an unusual and long-continued scarcity and the greatly depreciated currency in which payments were made in 1811 and 1812, had produced the most extravagant speculations in farming. Barren wastes were reclaimed at an enormous expense, which never could have been repaid, except by maintaining corn at famine prices. Rents and debts had advanced in a similar proportion, and all classes of agriculturists, farmers and landlords, had adjusted their

expenditure according to the new scale of prices, which they expected would endure. Family settlements and encumbrances were calculated on the same basis. Immediately after the peace, the great fall in the price of all sorts of agricultural produce, both from greater abundance and the destruction of the rotten country paper currency, threatened all persons connected with the "landed interest" with general ruin, and after a considerable struggle the corn bill of 1815 was passed, the intended and expected effect of which was to prevent wheat ever falling below 80s. a quarter. Buoyed up with delusive hopes, and firmly believing that the Act had for ever nailed up wheat to 80s. a quarter, the farmers received a fresh stimulus to speculation, and vast sums were laid out in further extending the cultivation of barren wastes. However, the circumstances we have already detailed disappointed all these calculations, and wheat stood at 38s. at the end of 1822, in defiance of the Act which said it ought to be at 80s.

182. The opponents of the Act of 1819 did not fail to turn the undoubted distress of the agricultural classes to their own purposes, and they commenced an attack on the currency law on April 9, 1821. This attack proved a complete failure, being rejected by a majority of 141 to 27. As prices continued to fall during that year, the distress continued to increase; and early in 1822 a Committee of the House of Commons was appointed to report upon the subject. They presented their report on the 1st April, but it did not contain a word imputing the low state of prices to anything connected with the currency. They attributed it to the unprecedented abundance of agricultural produce, and proposed plans for affording the farmers and others relief by temporary advances of Exchequer Bills, until the glut in the market had diminished. In the debate that followed, Lord Londonderry ridiculed the idea that the currency had anything to do with the question, and said members had only wasted precious time in bringing it forward. But he declared that he entered his most solemn protest against the purpose of these members to induce Parliament to commit the most flagrant deviation from sound policy and common honesty—a breach of faith towards the public creditor. Could a British House of Commons sanction such a measure, it would relieve no class of the community; but it would overwhelm all classes with ruin. Were it possible for them to be dishonest and base enough to listen to a project of national bankruptcy, the result must be most calamitous. If a Parliament could be found so degenerate, and a people so destitute of honour and common honesty, as not to start at the idea of such an abandonment of principle, the most sordid calculation would forbid the adoption of such a measure.

183. The £1 note issues of the country bankers in England had been suppressed by Statute 1777, c. 30, but in 1797 they were again permitted, and by various Acts of Parliament this permission was continued till two years after the resumption of cash payments by the Bank of England. By the operation of these several Acts, they must have been withdrawn in 1825. The distress, however, which was attributed by so numerous and powerful a party to the contraction

of the currency, was employed to induce ministers to relax this restriction, and country bankers were permitted to continue their £1 notes till the expiry of the Bank Charter in 1833. In order to improve the quality of the country bank notes, the Government attempted to enter into negotiations with the Bank of England to permit joint stock banks to be formed at a distance of sixty-five miles from London. The Government was satisfied that if joint stock banks on the Scotch system could be formed, it would add much to the stability of public credit. Lord Londonderry pronounced a warm eulogium upon the Scotch banks, and said that it was the wish of the ministry that a similar system should be introduced into England. The bribe to the Bank of England to consent to this arrangement, was an extension of their charter for ten years, but the negotiation failed.

184. The opponents of the Act of 1819 were encouraged to make an attack upon it by the unquestionable public distress that existed. On the 11th June, 1822, Mr. Western moved for a committee to inquire into the effect of the Act upon the general interests of the empire. The burden of his speech was, that all the distress of the country was due to the Act of 1819, and to that only; which he said had made a violent contraction in our currency at once. This assertion, which was the main pillar of his argument, is demolished by the simple fact that the great contraction of the currency, and the restoration of the note to par, took place in 1816. He moreover assumed that the currency had been depreciated ever since the Restriction Act of 1797. Mr. Huskisson immediately followed in a speech demolishing the whole of Mr. Western's sophistries one by one, and drawing a close parallel between the state of the currency in 1696, and at that time; and he concluded by moving the same resolution that Mr. Montague had done in 1696, "That this House will not alter the standard of gold or silver in fineness, weight, or denomination." After a debate of two nights, Mr. Western's motion was rejected by a majority of 194 to 30, and Mr. Huskisson's amendment agreed to.

185. While this party clamoured so loudly that all the distress of the country was owing to the currency Act of 1819, there was an unanswerable argument to confute them, that the prices of agricultural produce were equally depressed all over the continent of Europe. The fluctuations, indeed, on the continent were more violent even than in England. At Vienna, wheat, which was at 114s. in March, 1817, fell in September, 1819, to 19s. 6d.; at Munich, wheat fell from 151s. in September, 1817, to 24s. 6d. in September, 1820. The same phenomena were observed in Italy. Similar, but less extensive, fluctuations took place at Lisbon. What could the Act of 1819 possibly have to do with these places? The speech from the throne in France very properly attributed the low prices to the enormous abundance of production.

186. But not only is it an absolutely certain historical fact that the Act of 1819 had not the remotest connection with the low prices of 1822, but it is proved by most overwhelming evidence, *that it caused no contraction of the currency at all.* Mr. Turner, a director of the Bank, states, "With regard to the effect of Mr. Peel's Bill on the Bank of England, I can state from having

been in the direction during the last two years, that it has been altogether a dead letter. It has neither accelerated nor retarded the return to cash payments." And Mr. Tooke shews most conclusively that the amount of the currency so far as it consisted of Bank of England notes and coins, was much larger in 1822 than in 1819. That this Act, then, caused any contraction of the currency is a statement most contrary to truth. Its only effect was, what Parliament had over and over again pledged itself to do, to fix a time for the return to cash payments, and such a return to cash payments would, by its own natural operation, prevent the extravagant issues which the Bank had made during the restriction, which depreciated the note 30 per cent., and robbed every creditor of one-third part of his property. The Act of 1819 merely restored the Bank to its condition before 1797, and it became subject to the same unerring laws of nature, as its directors had confessed it felt before the restriction.

187. By the beginning of 1823, the very inferior crop of 1821 had been chiefly consumed, and the crop of 1822 being of far superior quality, prices began slowly to rise, and the spring of 1823 proving very backward, prices rose so rapidly that in June wheat stood at 62s. 5d.; at the end of the year they were still 37 per cent. below the "remunerative" 80s. which Parliament held out to farmers as the price which should be secured to them. It is a favorite theory with some persons that the rise of prices in 1823 was owing to the extension of country bank issues, in consequence of the Act of 1822 prolonging the term of their existence. Such a notion, however, is decidedly negated by the evidence of Mr. Burgess, the secretary of the Committee of Country Bankers, before the Committee of 1832, where it is shewn that the issues in 1823 were rather lower than in 1822, and nearly 12 per cent. lower than in 1818—(*Report*, p. 414). Mr. Tooke also shews that during 1823, while the price of wheat was rising, the prices of most other commodities were falling, from which circumstance he very conclusively pronounces that the idea that the variation of the currency had anything to do with prices in those years is utterly unfounded.

188. The continued depression of the prices of agricultural produce, so much below what had been expected, created no doubt much distress among those persons who were hampered with obligations they had entered into upon the scale of 1811 and 1812, and several petitions were presented to both Houses of Parliament complaining of it. Mr. Western, not satisfied with the great rebuff he had met with in 1822, when the distress was far more severe, again endeavoured to induce Parliament to disturb the settlement of 1819. The motion, however, was rejected by a majority of 96 to 27, and was the last attempt to tamper with the measure of value.

189. Prices rose considerably in 1824, the harvest of 1823 being deficient both in quality and quantity, and wheat stood at 78s., and continued so at the end of the year. The Bank had been for some years accumulating treasure to meet the anticipated deficiency of the country issues expected to follow the suppression of the £1 notes. When the unhappy change in the policy of the government took place, this great amount of bullion was rendered comparatively

useless, and the country banks began to extend their issues in 1824, and in 1825 they were beyond what they were in 1818. In January, 1824, the bullion in the Bank amounted to £14,200,000. During the preceding year, a readjustment of rents, to meet the altered state of prices, had taken place, and the old stocks having been gradually worked off, the energy of the people began to revive. The enormous amount of cash in the Bank, for which there was no immediate use, enabled the Government to carry through a great financial operation, the reduction of the interest upon nearly a quarter of the National Debt. The Navy 5 per cents. were reduced to 4 per cent., and the 4 per cent. stock to 3½. This vast operation had a very considerable influence in curtailing the incomes of many persons who could ill afford it, to a very inconvenient extent, and prepared them to look out for more profitable investments for their money. Notwithstanding the unhappy and severe distress of the agricultural portion of the community, Mr. Tooke says that the trading and manufacturing interests had never before been in a more regular, sound, and satisfactory state, than in the interval from 1821 to 1824. At the close of the session of 1823, the king congratulated Parliament on the flourishing condition of all branches of our commerce and manufactures, and the gradual abatement of agricultural distress.

190. At the close of 1824 the seeds of the disasters which ensued in the end of 1825 were sown. Towards the end of that year it became evident that the supply of some of the leading articles of consumption was falling short. A spirit of speculation sprung up, and as in all similar cases, a few early purchases, which were successful, induced extensive imitation; and at the end of 1824, and beginning of 1825, this had amounted to positive infection, numbers of persons being induced to go out of their own line of business to speculate in articles with which they had no concern whatever, but induced by the representations of their brokers to do so, in the hopes of realizing great and immediate gains. The opening of the markets of the South American republics and Mexico, in consequence of the achievement of their independence, opened a boundless field for speculation. Visions of boundless wealth dazzled the eyes of the public, from the working of the gold and silver mines with British capital. The long struggles for independence had inspired the British people with much sympathy for the juvenile republic, and when they wanted to borrow money the British were only too eager to lend it. It is alleged that £150,000,000 of British capital was sunk in different ways in Mexico and South America.

191. The king's speech, at the opening of the session of 1825, declared the utmost gratification at the continuance and progressive increase of the public prosperity. The speech of the mover of the address was exactly in the same laudatory strain. And yet no sooner was the debate on the address ended, than the Lord Chancellor called the attention of the House to the dangerous extent to which the mania for joint stock companies had gone, and said that he would move for leave to bring in a bill to restrain the system. Within seven weeks afterwards, Lord Lauderdale called the attention of the House to the fury

for joint stock companies, which had taken possession of the people, and said that the schemes already subscribed for amounted to £200,000,000.

192. Now, what was the conduct of the Bank of England during this period? The bullion which stood above £14,000,000 in January, 1824, was reduced to £11,600,000 in October, 1824. The exchange on Paris had been falling ever since the close of 1823. The last time it was above par was in June, and since then the fall had been continuous. The decrease in bullion had been steady, uniform, and rapid ever since March. Now, when it was known that immense sums were leaving the country, and the exchange falling lower, what did the Bank do? It *increased* its issues. During the month of October, 1824, they were increased £2,300,000. When every consideration of common sense and prudence demanded a rapid *contraction*, when the speculative fever was plainly declared, instead of doing what they could to check it they added fuel to the flames. The directors set all the principles of the Bullion Report at utter defiance, and of course the drain upon them proceeded with increased rapidity. In April, 1825, the bullion was diminished by upwards of £4,000,000, and their issues were £3,600,000 higher when they had only £6,650,000 of bullion, than when they had £14,000,000.

193. The speculative fever was at its height in the first four months of 1825, when it came to an end in the natural course of things. Vast numbers of persons who had embarked in these wild schemes, with the hope of selling out before the inevitable crash came, were now called upon for their subscriptions. Vast quantities of capital having been already absorbed, had the inevitable effect of raising the rate of interest. Successive calls compelled the weaker holders to realize, and while the demand for ready money was immediate and pressing, the prospect of returns was distant and uncertain. Accordingly, after May and June, the decline was rapid. The South American mines and loans proved almost total losses. The increase of commodities which speculation had caused rapidly sent down prices. The obligations of the speculators now became due, and the sale of the commodities had to be forced to meet them. Universal discredit now succeeded, goods became unsaleable, so that stocks which are usually held in anticipation of demand, were wholly unavailable to meet the pecuniary engagements of the holders. Merchants who had accepted bills for only half the value of the goods consigned to them, were unable to realize even that half, or even obtain advances on security of the bills of lading, and the advances already made were peremptorily called in. The usury laws, which limited interest to 5 per cent., greatly aggravated the distress. Nobody would lend money at 5 per cent. when its real value was so much greater, hence numbers, who would gladly have paid 8 or 10 per cent. interest, were obliged to sell goods at a difference of 30 per cent. for cash compared with the price for time.

194. The bankers in the country had followed exactly in the steps of the Bank of England. While the fever was raging, they had increased their issues and liabilities by speculative advances on commodities. The persons to whom these advances had been made, had no means of repay-

ing them, but the "promises to pay" the bankers had lent them, still remained in circulation, and must be met. The bankers foresaw the coming storm, and endeavoured to provide funds to meet it. The Bank of England itself had its eyes opened to the suicidal career it was following in May, and then endeavoured violently to contract its issues. This sudden change of policy only aggravated the general feeling of discredit. During the Autumn everything portended the approach of the impending catastrophe. At length the storm burst in December, and the week from Monday the 12th to Saturday the 17th was the height of the crisis. As we have fully considered this great crisis, along with the other crises (CRISIS, COMMERCIAL) we shall say no more about it here, except this, that the Bank having persevered in the policy of the most stern and severe restriction up till Wednesday night, and having destroyed several houses of first rate magnitude by that conduct, thereby flying right in the face of the Bullion Report, on that day totally reversed their policy, and during the remainder of the week discounted with the utmost profusion, and by that means, and that means only, acting strictly in accordance with the principles of the Bullion Report, saved themselves and the whole public credit of Great Britain. Between Wednesday the 14th and Saturday the 17th, the Bank issued upwards of £5,000,000 of notes.

195. The waves of discredit were of course propagated through the country, and during the following week the demand still continued great from the London bankers for their country correspondents. During this time, some of the directors remembered that there was a chest of their £1 notes which had never been used, and it occurred to them that these notes might be used to stay the panic in the country districts, and the discredit of the country notes. This idea being communicated to the London bankers, they greatly approved of it, and the sanction of the Government was asked for the experiment. The Government agreed, and the notes were sent off to the country bankers without delay, and produced instantaneous relief. By the 24th December the panic was completely allayed all over the country, and the amount of the £1 notes issued by the Bank was under £500,000. And by the beginning of 1826, the credit of the banking world was completely restored (CRISIS, COMMERCIAL).

196. When the causes of this terrible calamity came to be discussed, there were not wanting many who laid the whole blame upon the excessive issues of the Bank, as well as those of the country banks. But though it is indisputable that the Bank acted on the most unsound principles in not contracting its issues when the great drain of bullion for exportation was going on, it is a mere delusion for men to attribute the consequences of their own wild and extravagant mania to the Bank of England, or to any banks. The errors of all the banks put together were trivial when compared to the outbreaks of speculative insanity which seized upon all classes. It was not the issues of some bank notes, more or less, which originated the calamity, but the insatiable thirst of growing suddenly rich that seized upon so many persons, and led them to

embark in the maddest schemes, totally out of their line of business. Was it the issue of bank notes that led a respectable bookselling firm to embark £100,000 in a speculation in hops?

197. The worthless character of a great portion of the country bank paper had greatly aggravated the calamity. The Government and the Bank, at last learning wisdom from these repeated convulsions, which seemed to recur periodically, became sensible that it was imperatively necessary to provide a currency of a more solid description for the country, and that the frightful evils of the monopoly of the Bank of England must come to an end. Parliament met on the 3rd February, 1826, and six paragraphs of the speech from the throne were occupied with the commercial catastrophe, and it said that part of the remedies to be applied consisted in placing the currency and circulating credit of the country on a more firm foundation. Lord King severely blamed the constitution and management of the Bank. Lord Liverpool chiefly blamed the excessive issues of the country banks, and said that the small notes must be gradually withdrawn, and a metallic currency substituted. He said that he was perfectly satisfied, and had entertained the conviction for years, that the country had grown too large, and that its concerns had become too extensive, to allow of the exclusive privilege of the Bank of England. Its privilege had operated in a most extraordinary, and, as he thought, unfortunate manner for the country. Any small tradesman—a cheesemonger, or a butcher, or a shoemaker—might open a country bank, but a set of persons with a fortune sufficient to carry on the concern with security, were not permitted to do so.

198. The ministry took upon themselves to prohibit any more stamps being issued to the country banks for £1 and £2 notes. The Chancellor of the Exchequer said that those notes were to be deprecated as an infringement of the Act of 1819, which, no man could deny was passed, if ever any Act was, with the unanimous approbation of all the parties of which Parliament was composed, an Act which had been solemnly resolved upon as the only measure which could enable the country to meet any future danger, by placing the circulating medium on a permanent and stable footing. No man could insinuate that that Act was not the result of the deliberate conviction of almost every individual of every party in that house. He always had regretted, and he still regretted, the step taken by Parliament in 1822, which permitted them. The intention of the government was, therefore, to suppress them as soon as possible in England, and subsequently in Scotland and Ireland. He moved a resolution that no fresh notes were to be issued by country bankers in England under £5, and that those printed before the 5th February, 1826, might be issued, re-issued, and circulated until the 5th April, 1829, and no longer.

199. The opinions expressed in Parliament and the country were of course most conflicting as to the causes of this great catastrophe, but the great preponderance of opinion was adverse to the small note issues. Mr. Baring, who defended the country bankers from the accusations levelled against them, said that their small notes were bad as a permanent system, and they ought to be

called in. Even although they might sometimes be of almost indispensable use to the country, still, if the misery which had been caused by their use among the poorer classes were taken into consideration, it was a sufficient reason why the nuisance should be abated; and it was his opinion that the House had not got rid of this deluge of paper at the time when it had the power to do so, and that it had not resisted, as it ought to have resisted, the importunity of the country bankers. That these small notes should be abolished as soon as practicable.

200. Mr. Huskisson bestowed the warmest commendation on the conduct of the Bank during the crisis, which he said had saved the country from a general convulsion, and which had had the particular recommendation of the Premier and Chancellor of the Exchequer. He and all the other influential speakers earnestly advised the total suppression of the small notes, and the proposition was carried by a majority of 222 to 39, and a motion to continue the small notes of the Bank of England was rejected by 66 to 7.

201. The chief provisions of the Act, Statute 1826, c. 6, for prohibiting small notes in England, are as follows:

I. The Act repealing the Act, Statute 1777, c. 30, which prohibited promissory notes and bills under 20s. was repealed, thereby reviving the former Act; but all notes of private bankers stamped before the 5th February, 1826, or of the Bank of England stamped before the 10th October, 1826, were exempted from its operation, and were permitted to be issued, re-issued, and negotiated until the 5th April, 1829.

II. Any person after that date, making, issuing, signing, or re-issuing any note or bill under £5, was subject to a penalty of £20.

III. Any person who published, uttered, or negotiated any promissory or other note, or any negotiable or transferable bill, draft, or undertaking in writing for the payment of 20s., or above that sum, and less than £5, or on which such sum should be unpaid, should forfeit the sum of £20.

IV. These penalties were not to attach to any person drawing a cheque on his banker for his own use.

V. All promissory notes under £20, made payable to bearer on demand, were to be made payable at the bank, or places where they were issued, and as many more places as the issuer pleased.

202. When the government determined on suppressing the small note issues in England, they said it was their intention to extend the measure in a short time to Scotland and Ireland. However much Scotland may have suffered from commercial overtrading, as every commercial country must occasionally do, no *banking* panic had ever occurred, such as those which had so frequently desolated England. As soon as the ministerial intentions were known in Scotland, a great ferment was excited. Sir Walter Scott published three letters on the subject, under the pseudonym of "Malachi Malagrowther," which tended much to fan the public enthusiasm, and such an opposition was organized, that the ministry were obliged to consent to appoint committees of both Houses on the subject. These committees sat during the Spring of 1826, and

investigated the whole subject of Scotch banking, at great length, which had been very little understood in England before that time, and the result was so eminently favorable to the Scotch banking system, that the ministry abandoned their intention of attempting to alter it.

203. The year 1827 is memorable as the era when the principles of the Bullion Report were at length acknowledged to be true, and professedly adopted by the Bank. Mr. Ward stated in 1832, that there was not a single person in the Bank, but who admitted that its issues should be regulated by the foreign exchanges and the bullion market, or disposed to act in opposition to it. That in 1819, the Directors had forwarded a resolution to the House of Commons, denying that the exchanges were to be regarded in regulating the issues. Subsequently, however, to that year, opinions became changed, and they found the merits of the case such as they really were. He himself had always been convinced of the truth of Mr. Horner's principle, and from being connected with the exchanges, had many opportunities of observing the practical truth of it. The Bank Directors, however, were not convinced of it, because they found in practice, that the exchanges did not follow the issues of the bank. But the truth was, that they neglected to consider the country issues, and it was only in 1819 that they obtained a correct account of the issues of country banks. When that was got it was found that, taking the Bank and the country issues together, the principle was shown to be quite correct. The observation of these facts had gradually convinced the directors, and in 1827, he thought the court ripe for expunging the resolution of 1819, and it had accordingly been done. And, in 1832, there was not a single director who disputed its truth. A memorable warning that it is not always those who are engaged in the practice of a business, who are always the best judges of its scientific principles; and a great encouragement to those, who, being firmly and surely convinced, that they are the advocates of true principles however much they may be neglected and run down for a while, to persevere in the undoubted belief that the triumph of true principles though long delayed, is ultimately certain.

204. Although the Act of 1777 had forbidden notes under £5 to be issued in England, it did not prohibit the circulation of the Scotch £1 notes in England, and they had always circulated in the districts adjacent to Scotland, and even as far south as York. When the English £1 notes were suppressed, it seemed naturally to follow that the circulation of the Scotch notes in England should be forbidden. But the districts in which they had always circulated were as unanimous as Scotland itself against the measure. In 1828 the ministry brought in a bill to restrain the circulation of Scotch bank notes in England. Sir James Graham presented a petition from the borderers deprecating in the most earnest terms the withdrawal of the Scotch notes to which they had been so long accustomed. For seventy years, they said, they had possessed the advantage it was now sought to deprive them of—the advantage of the Scotch currency. Seven-eighths of the rents of estates were paid in the paper currency of

Scotland, and no loss had been sustained in consequence of it. After a debate of two nights the motion was carried by 154 to 45. The Act, Statute 1828, c. 65, provided that after the 5th April, 1829, no corporation or person whatever should publish, utter, negotiate, or transfer in any part of England, any promissory note, draft, engagement, or undertaking in writing, payable to bearer on demand, for less than £5, or upon which less than £5 remained unpaid, which should have been made or issued, or purport to have been made or issued in Scotland or Ireland, or elsewhere out of England, under a penalty of not less than £5 or more than £10. The same exemption as to cheques as in the former Act.

205. In 1832, during the crisis of the Reform Bill, a run upon the Bank took place, which lasted for about a fortnight, but as it was merely from political feeling in London, and did not extend into the country, no serious result ensued.

206. The Bank charter expired at the end of one year's notice, to be given after the 1st August, 1832, and this time the Bank had done no such services to government as to be in a position to demand from it a renewal of its monopoly, several years before it expired. Moreover, these exclusive privileges, as Lord Liverpool said in 1825, were now out of fashion. Many great monopolies were now on the eve of breaking up, and the public mind was more roused and enlightened on the subject of banking, from the discussion caused about the severe distress of 1825. Before taking any steps towards the renewal of the charter, the Government determined to have an inquiry before a secret committee of the House of Commons, which was appointed on the 22nd May, 1832, and sat for some months, and did not make any report till the end of the session. The inquiry was extremely incomplete. Many of the most interesting subjects connected with it were scarcely touched upon. At the close of the session, it reported the evidence to the House as far as it had gone. It was expected that a new committee would have been appointed in the new Parliament to continue the inquiry, but the Government in the meantime made up their minds as to the changes they intended to make in the Bank monopoly, and dispensed with any further inquiry.

207. Although the inquiry was left in a very incomplete state, as to many branches of the subject, the evidence given embraced many points of interest. The most important were—the rules adopted by the Bank for regulating their issues; the expediency, or the contrary, of publishing their accounts; the expediency, or the contrary, of establishing Joint Stock Banks; or of having one or more Banks of Issue in the Metropolis; the causes of the panic of 1825, and the action of the Bank during that period; the advantages, or the contrary, of making bank notes legal tender; and the effects of the usury laws on commerce.

208. The great truths regarding the regulation of a paper currency, which had been approved of by the Bullion Committee, were now unanimously recognized by the directors, and Mr. Horaley Palmer, the governor of the Bank, being asked by what principle in ordinary times the Bank was guided in the regulation of its issues, said that in a period of a full currency, and consequently with a par of exchange, the Bank considered it desirable to invest two-thirds of its

liabilities of all sorts in interest-bearing securities, and one-third in bullion. The circulation of the country being then regulated by the action of the Foreign Exchanges, the Bank was extremely desirous to avoid using any active power of regulating the circulation, but to leave that entirely in the hands of the public. The action of the public was fully sufficient to rectify the exchanges, without any forced action on the part of the Bank, in buying or selling securities. He thought it desirable to keep the securities very nearly at the same amount, because then the public could always act for themselves in returning notes for bullion for exportation when the exchanges were unfavorable; and if there was a great influx of gold, the Bank could always re-assume its proportion by transferring part of the bullion into securities. He considered that the discount of private paper was one of the worst means which the Bank could adopt for regulating its notes, as it tended to produce a very prejudicial extension of them. He condemned strongly the practice of the Bank during the restriction with respect to the extensive discounts of mercantile paper at 5 per cent. when the market rate was much higher, which necessarily led to an excessive issue. In this opinion Mr. Palmer was undoubtedly right, but he forgot that the usury laws prevented the Bank charging more than 5 per cent.

209. The great majority of the witnesses were in favor of the publication of the Bank accounts, as tending to inspire greater public confidence than the mystery in which they were then enveloped, and also as acting as a check upon the directors, themselves. Almost all the witnesses were against joint stock banks in London, as they would tend to injure the private bankers. Considering the ideas of the age when class interests were supreme, we need not be surprised at this unanimity of feeling; nor that it rather escaped the attention of the witnesses, that it was not the interests of the private bankers, however respectable they were, that was the paramount consideration, *but what was best for the public good*. And still more decidedly were the witnesses opposed, with scarcely an exception, to the establishment of any new joint stock banks of issue in London. There was a very prevalent feeling that Bank of England notes should be made legal tender, as a means of allaying a drain on the country bankers for gold during a panic.

210. It was at this time we may date the first prominent appearance of the great modern heresy that bills of exchange and cheques form no part of the circulating medium or currency. As this unhappy doctrine, however, was much more emphatically pronounced a few years later, we may defer any further mention of it till then.

211. The harvest of 1832 was unusually abundant, which caused a great depression in the price of all sorts of agricultural produce, towards the end of that year, followed, of course, by "agricultural distress." This was brought before the notice of Parliament in the speech from the throne at the opening of the session of 1833, and a committee was appointed to inquire into it. This distress afforded the irreconcilable enemies of the Act of 1819 another opportunity of attacking it. Mr. Attwood moved for a committee to inquire how far the present distress

was connected with the monetary system. Lord Althorp immediately met the motion by an amendment, that any change in the monetary system which would have the effect of lowering the standard of value, was inexpedient, which, after a debate of three nights, was carried by a majority of 304 to 49.

212. On the 31st May, 1833, Lord Althorp moved a series of resolutions for the renewal of the Bank Charter, one of which was, that so long as the Bank was bound to pay its notes in gold, bank notes should be declared legal tender, except by the Bank itself. Several members wished for further delay to consider the resolutions, as the session was nearly at an end; but Sir Robert Peel was decidedly of opinion that the House would be abandoning its duty if it consented to postpone the question. He was of opinion that it was desirable to continue the privileges of the Bank, and that there should be but one bank of issue in the metropolis, in order that it might exercise an undivided control over the issue of paper, and give facility to commerce in times of difficulty and alarm, which it could not give with the same effect if it were subject to the rivalry of another establishment. He resisted at great length the proposition for making bank notes legal tender, as a departure from the principle of the Act of 1819, and the true principles that should govern a paper currency. It was decided by a majority of 316 to 83 to proceed with the consideration of the resolutions. The plan of making bank notes legal tender gave rise to much difference of opinion, but was carried by 214 to 156.

213. We have already seen that the public had attempted at various times to form rival banking companies to the Bank of England, and in 1709 and 1742 the Bank Acts had been framed to stop up various loopholes which had been successively discovered. In 1742 the phraseology used had been supposed to be quite effectual for that purpose. At that time the custom of giving notes payable to bearer on demand to their customers in return for deposits, or in the discount of bills, was considered so essentially the fundamental idea of banking, that to prohibit the issue of these notes was deemed an effectual bar upon carrying on the business of banking. But in process of time—about 1772—the London bankers discontinued issuing notes payable to bearer on demand, and adopted the modern system of creating credit by means of entries and cheques. The Act of 1742 was considered to be so effectual a bar upon establishing banking companies in general, that for a long time it escaped public observation, that the change in the method of doing business enabled banking companies to elude the wording of the Act of 1742. In 1796, when in consequence of the restrictive measures of the Bank of England, much distress was felt in London from the want of a circulating medium, an association of merchants and bankers was formed for the purpose of providing a circulating medium, which should not infringe the privileges of the Bank; the question was considered by them, in what the Bank's privilege of exclusive "banking" did consist, and they determined, "The privilege of exclusive banking enjoyed by the Governor and Company of the Bank of England, as defined by the Acts of Parliament under

which they enjoy it, seems to consist in the power of borrowing, owing, or taking up money on their bills or notes payable on demand." About the year 1822, some writers detected this flaw in the monopoly of the bank, and maintained that a joint stock bank of deposit was no infringement of the charter, and that such banks might be formed, and carry on a very successful business, without issuing notes at all, but by merely following the practice of the London bankers, and adopting cheques. Though this idea was a good deal discussed in pamphlets at that period, no practical result ensued.

214. It is somewhat remarkable that the discovery should have been allowed to lie unfruitful for so long a period. When the Government first entered into negotiations with the Bank in 1833, concerning the terms of the renewal of the charter, they, as well as the whole mercantile community, were persuaded that the monopoly forbade banks of any description whatever, with more than six partners, being formed. In the course of the negotiation, however, this was brought under the notice of the Government, who took the opinion of their law officers on so important a point. The opinion of the crown lawyers was, that the clause did not prohibit joint stock banks of deposit being formed. The directors and proprietors of the Bank were much disturbed at finding this flaw in their monopoly, and requested the Government to have it rectified; but Lord Althorp said that the bargain was that their privileges should not be diminished, but he would not agree to any extension of them. In order to remove all doubts upon the subject, the Solicitor-General brought up a clause by way of rider, declaring the right to form such banks. He said that the basis of the contract with the Bank was, that they were to enjoy whatever monopoly they already possessed, but nothing beyond it. He had examined the case with the utmost care, and there was no pretence for saying that such banks were an encroachment upon the monopoly of the Bank. The Bank, as originally founded, was a *bank of issue*, and the monopoly first granted in 1697, must be held to refer only to banks *ejusdem generis*. Such had been the uniform language of all the subsequent Acts. The clause upon which their monopoly rested was strictly confined to the issue of paper money. Banks of deposit were lawful at common law, and it rested with those who said they were forbidden, to point out the Act which prohibited them.

215. The chief provisions of the Act were as follows, Statute 1833, c. 98:—

I. The Bank was continued as a Corporation, with such exclusive privilege of banking as was given by the Act, for a certain time, and on certain conditions, during which time no society or company, exceeding six persons, should make or issue in London, or within 65 miles thereof, any bill of exchange, or promissory note, or engagement for the payment of money on demand, or upon which any person holding the same may obtain payment on demand. But country bankers might have an agency in London, for the sole purpose of paying such of their notes as might be presented there.

II. For the purpose of removing any doubts that might exist as to what the exclusive privilege of banking, which the Bank of England enjoyed,

consisted in, it was enacted, that any body politic or corporate, or society, or company, or partnership, of whatever number they consisted, might carry on the business of banking in London, or within 65 miles thereof, provided that they did not borrow, owe, or take up in England any sum or sums of money on their bills, or notes payable on demand, or at any less time than six months from the borrowing thereof, during the continuance of the privileges of the Bank of England.

III. All the notes of the Bank of England, payable on demand which should be issued out of London, should be payable at the place where they were issued.

IV. Upon one year's notice, to be given within six months after the expiration of ten years from the first day of August, 1834, and repayment of all debts due by Parliament to the Bank, its privileges were to cease and determine, at the end of the year's notice.

V. So long as the Bank paid its notes on demand in legal coin, they were declared to be legal tender of payment, except by the Bank itself, or by any of its branches. No notes not made specially payable at any of the branches, were liable to be paid there, but the notes issued at all the branches were to be payable in London.

VI. Regulations about publishing its accounts, and exemptions of bills and notes, not having more than three months to run, from the usury laws.—These being altered now, need not be detailed.

VII. The public were to pay off one-fourth part of the debt due to the Bank, and the proprietors might reduce the capital stock of the Bank by that sum, if they chose.

VIII. In consideration of these privileges, the Bank was to give up £120,000 a-year from the sum they received for managing the public debt.

216. In consequence of the declaratory clause in this Act, permitting Joint Stock Banks to be founded in London, several were formed, as will be described hereafter. For several years after the renewal of the Bank Charter the harvests were unusually abundant, which caused all sorts of agricultural produce to be ruinously depressed. Wheat fell continuously through 1834 and 1835, till in the last week of December, 1835, its price was 36s. the imperial quarter. As all agricultural contracts were framed on the expectation that wheat would not be much less than 70s. the quarter, this long continued depression produced the most severe distress. At the same time, however, all the manufacturing interests were in a state of unexampled prosperity from the abundance and cheapness of food. The long continued low price of corn caused less to be sown in 1835, and the spring of 1836 was unfavorable. These causes combined to raise the price of wheat in 1836, and the harvest time being wet and cold, caused the price to rise to 61s. 9d. in the autumn.

217. The state of commercial prosperity during 1833, 1834, and 1835, gave rise to an immense amount of speculation and dabbling in foreign loans, as if people seemed incapable of learning wisdom from the experience of 1825. The unexpected success of the first railway gave rise to a considerable amount of speculation in the formation of railways. An immense extension of Joint Stock Banks economised capital to a great degree,

and afforded the means of the most fatal extension of credit. On the 14th August, 1834, Lord Wharncliffe called the attention of the ministry to the prodigious extension of Joint Stock Banks, and their branches, and the insufficient capital they were trading with. The important subject of Joint Stock Banking again occupied the attention of the House in 1836, and a committee was appointed to inquire into it. The committee sat during the Session and made two reports, which are noticed elsewhere.—(REPORTS, PARLIAMENTARY.)

218. We have seen that since the Bank of England had adopted the principles of the Bullion Report in 1827, the method they pursued of carrying them out, was to keep their "securities" as nearly as possible even, and to keep their bullion and cash equal to one half the "securities;" the bullion, cash, and securities being together equal to their "liabilities." Having got the Bank into this position while the exchanges were at par, to throw any action either of increase or decrease of their notes entirely upon the public, either by means of the foreign exchanges, or by an internal extra demand for gold. The Bank was got into this normal condition in October, 1833, when its "liabilities," i. e. the issues and the deposits, were £32,900,000, the "securities" were £24,200,000, and the "bullion" £10,900,000. In 1834 some commercial causes produced an export of specie; but in 1835 the foreign exchanges became favorable, and the drain was arrested. But in the meantime the Bank had totally lost all power of preserving the proportion between the bullion, securities, and liabilities it had professed to adhere to. The following table, taken at intervals, will exhibit this very clearly:—

1833.	Liabilities.	{ Securities—£22,640,000
1st Oct.	£30,937,000	{ Bullion £10,527,000
1834.		{ Securities—£24,777,000
11th March	£31,372,000	{ Bullion £ 8,901,000
15th March	£37,554,000	{ Securities—£31,735,000
		{ Bullion £ 8,298,000
9th Sept.	£31,058,000	{ Securities—£26,648,000
		{ Bullion £ 7,010,000
1835.		{ Securities—£29,165,000
18th Jan.	£33,071,000	{ Bullion £ 6,608,000
5th May.	£29,417,000	{ Securities—£26,179,000
		{ Bullion £ 5,961,000

This was the lowest point which the amount of bullion reached, and the drain was arrested. The above figures shew how totally deranged the proportions were to what the Directors considered to be a proper position for the Bank. From that time bullion continued to flow in, till in March, 1836, it slightly exceeded eight millions; but even then the securities were three times the bullion, instead of twice as they ought to have been.

219. The amount of bullion in the Bank was at its height in March, 1836, and then began steadily to decline again; in the middle of July it had fallen below six millions, when the Bank thought it was necessary to endeavour to stop it, and it raised the discount to 4½ per cent. This had no effect, however, in stopping the demand for discount. In September the bullion barely exceeded five millions, and the Bank raised the rate of discount to 5 per cent. The bubbles blown in the preceding year and spring of 1836, were now fast bursting on all hands.

220. The drain on the coffers of the Bank proceeded at a rapid rate, both from external and internal

causes. President Jackson had determined that the charter of the National Bank of the United States, which expired in 1836, should not be renewed, and that the currency of that country should be placed on a sounder footing than it had hitherto been, by forming a sound metallic basis. Operations to effect this purpose soon commenced. Immense quantities of American securities of all sorts were imported into England, and negotiated for the purpose of remitting the specie to America. The improperly low rate of discount in this country, favored by the inordinate multiplication of banks, enabled a great quantity of these securities of various descriptions to be realized in England, and the cash was remitted to America.

221. The joint stock banks had been blowing the bubble of credit to the utmost tenuity, by rediscounting most of the bills which they had discounted. This practice largely increases the proportion of paper currency compared to the metallic basis, and of course adds to any peril in times of discredit. The Bank of England at length, but too tardily, as has almost invariably been the case, awoke to the impending danger, and determined to strike a blow at the distended state of credit. It not only raised the rate of discount to five per cent. in August, but absolutely refused to discount any bills indorsed by any joint stock bank of issue. This was a great blow at the great amount of American securities afloat in the country, as most of those bills had been purchased by the joint stock banks, and re-issued with their own indorsements upon them.

222. In the autumn of 1836, the Agricultural and Commercial Bank stopped payment (BANKING IN IRELAND), and caused a general run upon all the Irish banks, which, however, having been foreseen, they had taken care to provide bullion to meet. But so great was the state of discredit, that even Bank of England notes were at a heavy discount in Dublin. In the meantime the drain on the Bank was increasing. At the beginning of October it had £5,035,000 in bullion, to meet £29,869,000 of liabilities; at the end of November its liabilities were £30,941,000, and the bullion £3,840,000. During December the bullion slightly increased, and in January diminished again. In November the Northern and Central Bank, with its head office in Manchester, and thirty-nine branches in the manufacturing districts, became seriously embarrassed, and applied to the Bank of England for assistance, which the Bank at first refused; but upon consulting the leading bankers in London, their opinion was, that the stoppage of so extensive a concern in the manufacturing districts would very probably bring on a general panic. The Bank, therefore, determined to advance the sum of £500,000 to enable it to meet its engagements, which, upon subsequently discovering that they were much more extensive than had at first been represented, was further increased to the sum of £1,370,000. Early in January, a London banking house applied for assistance to the Bank, and on the other London bankers giving their guarantee to the Bank of England, it made advances sufficient to enable that house to meet its engagements. The difficulties attending the American houses, both in London and Liverpool, became now so pressing, that they also were

obliged to apply to the Bank. Persons were appointed to look into their affairs, who represented that, if assistance were given them to meet their outstanding engagements, they would ultimately prove solvent. As an additional reason for granting this assistance, it was stated that, if these American houses were permitted to stop payment, their concerns were so vast, and so extended throughout the North of England, that a general destruction of credit would ensue. After full consideration the Bank determined to attempt to carry these houses through their embarrassments, and for this purpose it advanced the enormous sum of £6,000,000. This great operation, however, was successful, though the final liquidation of the account was retarded by the great prostration of American credit in 1839. The advances made to the banking interests in England were all repaid, principal and interest, with one very trifling exception. The Bank thus followed for a second time the principles laid down by the Bullion Report, and there can be no doubt averted a calamity only second in magnitude to the catastrophe of 1825.

223. The assistance of the Bank was only intended to be of a temporary nature, to give time for the gradual withdrawal of the great mass of unsound paper from circulation. This having been effected to a large extent the result followed, which always has been the case, and always must be the case, a great influx of gold to fill the vacuum caused by the great annihilation of this paper currency. During the whole of 1837 bullion rapidly flowed into the Bank, and in December it reached the sum of 10½ millions. The position of the Bank on the 13th March, 1838, was as follows:—

Liabilities.	{ Securities—£21,046,000
£31,573,000	{ Bullion £10,527,000

Thus, after a long period of five years, the Bank was at length brought back again into what the directors had laid down for themselves as the normal position, and it enabled credit to pass through a crisis which would have been tenfold more severe if it had not been met by that "judicious increase of accommodation," which the Bullion Report declared was the proper remedy for a temporary failure of credit.

224. From 1832 to 1837 there had been a series of seasons of remarkable abundance. For several years a series of great scarcity followed. The crop of 1838 was the worst that had been known since 1816, that of 1839 was scarcely if at all better. This great deficiency rendered it necessary to import foreign corn to the value of £10,000,000, a considerable portion of this required to be exported in specie. But just at this period a number of other concurrent causes happened to create a great demand for gold for foreign countries. During the preceding years America, France, and Belgium had carried the extension of paper credit to most extravagant lengths. In France and Belgium joint stock banks had been extensively formed. This great extension of paper currency had the very same effect as the over-issue of paper in England; it drove bullion out of those countries, and was one of the causes which, together with the fortunate destruction of the extravagant paper credit in England in 1837, caused such an influx of gold in this country up to March, 1838. But in this

latter year these bubbles burst. In the autumn of 1838 the Bank of Belgium failed, and a severe run upon the banks at Paris took place. This revulsion of credit, and extinction of paper issues in those countries, caused a current of bullion to set in towards them which came from the Bank of England.

225. In the beginning of 1838, when the bullion in the Bank had been rapidly increasing for several months, the commercial world thought it was time for the Bank to make use of the treasure in its vaults. It accordingly reduced the rate of discount from 5 to 4 per cent., and was induced to send over one million of sovereigns to America, the exchanges being favorable to that country, in consequence of the destruction of paper, to assist the American Banks to resume payments in cash. That is to say, the exchanges being AGAINST the country, the Bank *exports* bullion, and *extends* its issues!! What knowledge of Banking!!

226. On the 18th of December, 1838, the liabilities were £28,120,000, the securities £20,776,000 and the bullion £9,794,000. From this time a rapid and steady drain set in, which continued with unabated severity till October, 1839. When the Bank lowered its rate of discount to 4 per cent. in February, 1838, the market rate had fallen still lower, and in summer was about 3 per cent. From that time forward it began to rise, and, at the end of autumn, was level with the Bank. While everything was symptomatic of an impending drain of bullion, the Bank, on the 29th November, suddenly lowered its rate to 3½ per cent.! The market rate was now decidedly higher than that of the Bank, and the consequence was an immediate pressure for accommodation on the Bank. The securities which, in December, 1838, were £19,536,000, rose in January, 1839, to £27,594,000, and the bullion fell from £9,522,000 to £8,826,000. From that time forward until the middle of May, the drain of bullion continued, and on the 14th of that month, the liabilities were £25,711,000, the securities £24,098,000, and the bullion £4,117,000; that is, the bullion was a little more than *one-sixth* of the securities, when it ought to have been *one-half*, according to the theory of the Directors! On the 16th May, the Bank raised the rate of discount to 5 per cent., but the market rate had risen still higher, so that the drain continued. On the 20th May, the bullion stood at £3,910,000, but the directors were so utterly blind that, on the 30th, the time of shutting the books for the dividends, they still offered advances at 5 per cent. till the 23rd July. However, on the 23rd June, they became alarmed and raised the rate of discount to 5½, and refused to discount any securities except bills of exchange.

227. On the 16th July, the liabilities were £28,860,000, the securities £28,846,000, and the bullion £2,987,000, when the directors at last awoke to the fact, that the Bank was rapidly drifting into bankruptcy. On the 13th, they gave notice that they would be ready to receive tenders for the purchase of some terminable annuities, but the minimum price they fixed was so high that no sale took place. Besides raising the rate of discount in May, the Bank sold public securities to the amount of £760,000, and it authorized bills upon Paris to be drawn on its account to the amount of £600,000. These mea-

asures had the effect for a short time of arresting the drain. But when these bills came to maturity the Bank was in no better position to meet them, and it then became necessary to create a larger credit in Paris to meet the first. The position of the Bank was, of course, well known to all the foreign dealers in exchanges, and, in June, it was generally expected abroad, that it could not maintain payments in specie. In consequence of this, all long dated bills on this country were sent over for immediate realization, and the values withdrawn as speedily as possible. To counteract this drain, as well as to meet the payments of the first credit, which had been created on behalf of the Bank, it was obliged, in July, to organize a measure of a much larger nature. Messrs. Baring entered into an agreement with twelve of the leading bankers in Paris, to draw bills upon them to the amount of upwards of £2,000,000; and, as each of them had only a fixed credit at the Bank of France, that Bank agreed to honour their acceptances in case they should be presented there, and exceed their usual limits. An operation of a similar nature to the amount of £900,000 was organized with Hamburg. As soon as any bill was drawn on account of these operations, the Bank had transferred an equal amount of the annuities it had offered for sale in July, to two trustees, one for the drawers and the other for the acceptor. Out of this second credit the bills which fell due from the creation of the first credit were paid. This measure had the effect of gradually arresting the drain of bullion which reached its lowest point in the week ending the 2nd September, 1839, when it was reduced to £2,406,000. From that time it began slowly to increase, and in the last week of the year it stood at £4,532,000, the liabilities being £23,864,000, and the securities £22,098,000. The operations ensuing from this foreign credit extended over nine months, from July, 1839, to April, 1840, and the highest amount operated upon was in November, 1839, when it was £2,900,000.

228. The figures we have quoted, shewing the proportion between the bullion and the liabilities of the Bank, are sufficient to shew either that there was some natural impossibility in adhering to the rules the directors had laid down for their own guidance in 1832, or that they had not sufficient firmness to contract their issues in time of pressure to maintain it. The flagrant disproportion which these figures had assumed, which would scarcely be safe in an ordinary banking house, but which were to the last degree perilous in the Bank of England, which was known to be the last resource of every bank in the kingdom in times of difficulty, turned the attention of writers to devise some plan by which, if possible, the Bank should be compelled to maintain the proper proportion between bullion and liabilities. Lord Overstone, then Mr. Samuel Jones Loyd, is stated to have been the originator of the idea, which was eventually adopted, of dividing the Bank into two distinct departments independent of each other; one for the purpose of issuing a regulated amount of notes, and the other for carrying on the business of banking. This was one of the most prominent features in Sir Robert Peel's Act of 1844, and we shall reserve, till we come to that Act, any further notice of it.

229. The great commercial and monetary crisis the country had passed through within the few preceding years, attracted much public attention, and several petitions were presented to Parliament; and in March, 1840, the Government determined to institute an inquiry into the whole system of paper issues. On the 10th of that month the Chancellor of the Exchequer moved for a committee for that purpose. He reminded the House that the Bank Charter would terminate in 1844, and he thought it expedient that they should not postpone inquiry into the subject till the last moment. That whatever might be the difference of opinion among the most intelligent men, as to what part of the difficulties they had gone through were to be attributed to the Bank of England, or other banks, still they were very strongly of opinion that the present system required revision and alteration. The chief points of interest connected with the report and evidence, which we may mention here, are—

I. That the principles propounded in 1832, for the management of the Bank, for the purpose of conforming with the principles of the Bullion Report, were totally condemned.

II. The great modern heresy that bills of exchange form no part of the circulating medium or currency, which was first asserted before a Parliamentary Committee in 1832, was now maintained by the great majority of the commercial and banking witnesses.

230. This seems to have been the first adoption by mercantile men of the theory known by the name of the "currency principle," which shortly stated is this—*That when bank notes are permitted to be issued, the number in circulation should always be exactly equal to the coin which would be in circulation if they did not exist.* The advocates of this principle maintain that it is the only true mode of regulating a paper currency, and of preserving the paper of equal value with the gold coin. This theory sounds remarkably specious and plausible, and from the eminence of the persons who have been converted to it, has acquired much importance, and will require full examination (CURRENCY PRINCIPLE).

231. Nothing can be more wearisome than to read through the enormous mass of heterogeneous questions heaped upon one another, without aim or drift, tending to no result, and capable of producing none. Nothing can be more humiliating than the contrast between the bullion committee of 1810, and the committee of 1840. The bullion committee were masters of the science; they knew how to govern the direction of the inquiry, to cross-examine the witnesses, and make them expose their own fallacies, by involving them in contradictions and inconsistencies. And when the witnesses had given their opinions, the committee were able to judge and decide upon the value of the testimony, and the result was the complete demolition of the opinions of the great majority of the witnesses. But in the committee of 1840, the want of a presiding mind is painfully conspicuous. They were totally destitute of any knowledge of the principles of the science of banking, and after having protracted the inquiry through two sessions, they were obliged to come to the humiliating confession of their own incompetence to frame a report on the evidence given, and to

suggest to parliament the expediency of appointing a new committee for that purpose!

232. From 1838 a series of four bad harvests followed in succession, which were attended with much suffering to the people, high prices of corn, and, as a natural consequence, large importations of foreign corn, and a very low amount of bullion in the Bank. In fact, the alleged rule of 1832 was a complete dead letter, and it was not till the 27th August, 1842, that these proportions were again attained, when the liabilities stood at £29,022,000 and the bullion at £9,729,000. The crops of 1842, 1843, and 1844 were prodigiously abundant—the latter more so than any for ten years preceding. The consequences of this, as well as other circumstances which happened at that time to economize the capital of the country, produced a cycle of years of great apparent prosperity, but which ended in the great revulsion of 1847. The bullion in the Bank continued steadily and rapidly to accumulate until December, 1843, when it reached a higher limit than it had ever done before, being £14,982,000, and continued to increase after that until the passing of the Act of 1844.

233. On the 6th May, 1844, Sir Robert Peel moved a resolution of the House, that it was expedient to continue for a limited time certain of the privileges then enjoyed by the Bank of England, subject to any conditions that might be passed by any Act for that purpose. In bringing this resolution forward, he gave a preliminary sketch of the evils of the paper currency as it then stood, and the methods he proposed for placing it on a sounder footing. We shall not in this place enter into any account of the definitions of the word currency, or circulating medium, as we have done that in its proper place.—(CURRENCY: PEEL, SIR ROBERT). He then stated that it was the intention of Government to increase as much as possible the power of a single bank of issue, and that bank should be the Bank of England. The Bank was therefore to continue its privileges of issue, but it was to be divided into two departments, the one for the purpose of issuing notes, the other for the ordinary business of banking. But the Bank was to be deprived *once for all* of the power of unlimited issues. These were to take place in future on two foundations only: 1st, a fixed amount of public securities; 2dly, bullion. The amount of issues upon public securities was permanently fixed at £14,000,000, every other note was to be issued in exchange for bullion only, so that the amount of the notes issued on bullion should be governed solely by the action of the public. Although he wished there should only be a single bank of issue, yet existing interests were to be regarded; and those banks which were at that time lawfully issuing their own notes, might remain banks of issue; but their amount was to be strictly limited to a certain definite average.

234. It was impossible for Sir Robert Peel not to see the inconsistency of his measure of 1844, with his expressed sentiments in 1819 and 1833, that it was inexpedient to limit the issues of the Bank to any fixed amount, because there were times of commercial difficulty, when an increase of notes might be the proper remedy. There is no doctrine more strenuously insisted upon by the Bullion Report, by the Statesmen of 1819, as well as by the Government in 1833, and by Sir Robert Peel himself, at both these periods,

than that it was impossible to fetter the discretion of the Bank in its issues. Sir Robert Peel knew that he was now taking away this power from the Bank altogether, and accordingly he was obliged to meet this objection. He said—"It is said that the Bank of England will not have the means which it has heretofore had of supporting public credit, and of affording assistance to the mercantile world in times of commercial difficulty. Now, in the first place, the means of supporting credit are not means exclusively possessed by banks. All who are possessed of unemployed capital, whether bankers or not, and who can gain an adequate return by the advance of capital, are enabled to afford, and do afford that aid, which it is supposed by some, that banks alone are enabled to afford. In the second place, it may be a question whether there be any permanent advantage in the maintenance of public or private credit, unless the means of maintaining it are derived from the *bonâ fide advance of capital*, and not from a temporary increase of promissory notes, issued for a special purpose. Some apprehend that the proposed restriction upon issues will diminish the power of the Bank to act with energy at the period of a monetary crisis, and commercial alarm and derangement. But the object of legislation is to prevent (so far as legislation can prevent) the recurrence of those evils from which we suffered in 1825, 1836, and 1839. *It is better to prevent the paroxysm than to excite it, and trust to desperate remedies for the means of recovery.*" This extract shews the complete misconception of Sir Robert Peel on the subject of banking, because he believed that the advances were always made out of *bonâ fide capital*, whereas we have shewn that they are principally creations of credit.

235. The bill was read a second time, after a feeble opposition, by a majority of 185 to 30. It passed through the House of Lords with a very short debate, and no division. Lord Radnor alone protested against it, and it received the Royal Assent on the 19th July, 1844. Its chief provisions are as follows, Statute 1844, c. 32.

I. That after the 31st August, 1844, the issue of Bank Notes by the Bank of England should be kept wholly distinct from the general banking business, and be conducted by such a committee of the directors as the Court might appoint, under the name of the "Issue Department of the Bank of England."

II. That on the same day the Governor and Company should transfer, appropriate, and set apart to the issue department, securities to the value of £14,000,000, of which the debt due by the public to the Bank was to be a part; and also so much of the gold coin, and gold and silver bullion, as should not be required for the banking department. The issue department was then to deliver over to the banking department an amount of notes, exactly equal to the securities, coin and bullion, so deposited with them. The Bank was then forbidden to increase the amount of securities in the issue department; but it might diminish them as much as it pleased, and increase them again to the limit defined, but no further. The banking department was forbidden to issue notes to any person whatever, except in exchange for other notes, or such as they received from the issue department in terms of the Act.

III. The proportion of silver bullion in the issue department, on which notes were to be issued, was not at any time to exceed one-fourth part of the gold coin and bullion held at the time by the issue department.

IV. All persons whatever, from the 31st August, 1844, were to be entitled to demand bank notes in exchange for standard gold bullion, at the rate of £3 17s. 9d. per ounce.

V. If any banker, who on the 6th May, 1844, was issuing his own notes, should cease to do so, it should be lawful for the crown in council to authorize the Bank to increase the amount of securities in the issue department to any amount not exceeding two-thirds of the amount of notes withdrawn from circulation.

VI. Weekly accounts in a specified form were to be transmitted to Government, and published in the next London Gazette.

VII. From the same date the Bank was relieved from all stamp duty on their notes.

VIII. The annual sum payable by the Bank for their exclusive privileges should be increased from £120,000, as settled in 1833, to £180,000. And all profits derived by the Bank from the increase of their issues above the £14,000,000, as prescribed by the Act, should go to the public.

IX. After the passing of the Act, no person other than a banker who was lawfully issuing his own notes on the 6th May, 1844, should issue bank notes in any part of the United Kingdom.

X. After the passing of the Act, it was forbidden to any banker to draw, accept, make, or issue in England or Wales, any bill of exchange, or promissory note, or engagement for the payment of money payable to bearer on demand, or to borrow, owe, or take up in England or Wales, any sum or sums of money, on the bills or notes of such banker payable to bearer on demand, except such bankers as were on the 6th May, 1844, issuing their own bank notes, who were allowed to continue their issues in such manner, and to such extent, as afterwards provided. The rights of any existing firm were not to be affected by the withdrawal, change, or addition of any partner, provided the whole number did not exceed six persons.

XI. Any banker who ceased to issue his own notes, from any reason whatever, after the Act, was not to resume such issues.

XII. All existing banks of issue were forthwith to certify to the commissioners of stamps and taxes the place, and name and firm, at, and under which, they issued notes, during the twelve weeks next preceding the 27th April, 1844. The commissioners were then to ascertain the average amount of each bank's issues, and it should be lawful for such banker to continue his issues to that amount, provided that, on an average of four weeks, they were not to exceed the average so ascertained.

XIII. If any two or more banks of issue had become united during that twelve weeks, the united bank might issue notes to the aggregate amount of each separate bank.

XIV. The commissioners were to issue in the London Gazette a statement of the authorized issues of each bank.

XV. If two or more banks afterwards became united, each of less than six partners, then the commissioners might authorize them to issue

notes to the amount of their separate issues. But if the number of the united bank exceeded six, their privilege of issuing notes was to cease.

XVI. If any banker exceeded his authorized issues he was to forfeit the excess.

XVII. Every bank of issue was to send a weekly account of its issues, which was to be published in the *London Gazette*.

XVIII. The mode of taking the average was laid down, and bankers were to permit their books of account to be inspected by a government officer, properly appointed, and to make a return to government once every year, within the first fortnight in January.

XIX. The Bank of England was allowed to compound with private banks of issue, to withdraw their own notes, and issue Bank of England notes, for a sum not exceeding 1 per cent. per annum, up to the 1st August, 1856.

XX. All banks whatever in London, or within 65 miles of it, were allowed, after the passing of the Act, to draw, accept, or indorse bills of exchange, not being payable to bearer on demand.

XXI. The privileges of the Bank were to continue till twelve months' notice, to be given after 1st August, 1855, and repayment of the public debts, and all other debts whatever.

236. Such are the leading provisions of Sir Robert Peel's Act, which was meant to carry out a particular theory of currency, which we have no hesitation in affirming, is one of the most stupendous delusions on the subject any one ever conceived. For it was a formal inauguration of the "Currency principle," which is this: that "*A paper currency—meaning thereby bank notes, payable to bearer on demand—should always be exactly equal in amount to what a metallic currency would be, if they did not exist.*" This is the theory which the strenuous advocates of the Act always boast that it carries out. But they only exhibit their own profound ignorance of the mechanism of banking. In the first place, it is quite clear that the issue of £14,000,000 of notes is so much in excess of the metallic currency. The Bank gave £14,000,000 of sovereigns in purchase of these securities which are in circulation, and then it is allowed to create an additional sum of £14,000,000 in bank notes, which are also in circulation. Can any man in his senses deny that this operation doubles the quantity of currency to that extent? And this is the necessary result of all plans of issuing notes on the basis of securities; because it is quite clear that the securities must first be bought with money, and then, after that, an equal amount of notes are created, which are also treated as money. It is quite clear, then, that those persons who assert that the Bank Act of 1844, carries out the "Currency principle," assert this proposition:—

$£14,000,000 + £14,000,000 = £14,000,000.$

But, further than that, it is the universal belief that this Act prevents banks creating instruments of credit, and that bankers now only lend out the money they receive. But, in the preceding sections, we have shewn that this is a complete delusion. We have shewn that the business of banking consists in creating liabilities, and that the almost universal idea that the Joint Stock Banks have £40,000,000 of *bonâ fide* deposits in cash with them, is a complete fallacy, and that these figures are the substitutes and

representatives of the old bank notes. Consequently, the business of banking in London consists in creating millions of promises to pay every day. Hence, to shew the full error of those who think that the Bank Act of 1844 carries out the currency principle, we may say that they must believe that twice fourteen millions plus an indefinite number of millions, is equal to fourteen millions!! "*Etre dupe d'autrui,*" says Bastiat, "*n'est pas déjà très plaisant; mais employer le vaste appareil représentatif à se duper soi-même, à se duper doublement, et, dans une affaire de numération, voilà qui est bien propre à rabattre un peu l'orgueil du siècle des lumières.*"

237. But passing over a mere belief in a theory, whose correctness, or the contrary, this is not the place to inquire into, which we have done elsewhere—(CURRENCY PRINCIPLE)—this Act did what all the authorities of greatest note up to that time, and including Sir Robert Peel himself, had solemnly protested against, it IMPOSED A NUMERICAL LIMIT ON THE ISSUES OF THE BANK OF ENGLAND. We have shewn, under their respective heads, that the most eminent authorities, including Sir Robert Peel himself, had declared that there were times of difficulty and danger, when a JUDICIOUS INCREASE OF ACCOMMODATION was the true remedy to be adopted; and in 1833 Sir Robert Peel himself had protested against the institution of another bank of issue in the metropolis, because it would hamper the action of the Bank of England in supporting public credit. But in 1844 he had totally changed his opinion. He expressly took away this power from the Bank. The fact was, the theory he seemed to adopt was that all the preceding crises had been caused by the improper issues of the Bank of England and other banks, and if these could be prevented, there could be no crisis, and consequently no necessity for this power. Moreover, the authors of the Act of 1844 flattered themselves that for every five sovereigns that left the country, a five pound note must be withdrawn from circulation. We shall see shortly how these expectations were fulfilled. Sir Robert Peel alleged that this Act was the complement of the Act of 1819, now we have shewn—(Elements of Political Economy, chap. VII.; and PAPER CURRENCY)—that this idea is a complete fallacy, and that the Act of 1819 and the sentiments and opinions of its authors, are founded on a totally distinct theory of paper currency to the Act of 1844, and the opinions of its supporters. In the same Session an Act for the regulation of Joint Stock Banks was passed, which having been found to be nothing but a mischief and a nuisance, has been totally repealed!

238. Owing to the good harvests of 1842, 1843, and 1844, the bullion in the Bank accumulated very rapidly during those years, and a very large quantity of money, which the nation must otherwise have spent in food, was set free for commercial purposes. Other circumstances occurred at the same time, to liberate a large quantity of the capital of the country from its accustomed use, and to render it applicable to commercial purposes. These have been very clearly and ably pointed out by Mr. James Wilson.—(Wilson, JAMES).

239. The Act of 1844 having placed an absolute limit upon the discretion of the Bank in

Issuing notes, Sir Robert Peel said that he thought that banking business could not be too free and unrestrained. The extraordinary accumulation of capital, arising from the circumstances we have just alluded to, lowered the market rate of discount to $1\frac{1}{2}$ and $2\frac{1}{2}$ on the best bills, and the Bank of England immediately conformed to the market rate on the passing of the Act, and reduced its rate from 4 per cent. to $2\frac{1}{2}$ for the best bills. The day the Act came into operation the whole of the discounts were done at $1\frac{1}{2}$, and they continued at that rate for a fortnight, when some were done at 2 per cent.; and up to the 26th October a considerable portion was done at $2\frac{1}{2}$. From this date, however, up to October, 1845, the rate was $2\frac{1}{2}$; in November, 1845, the rate was suddenly raised to $3\frac{1}{2}$, and continued at that figure till August, 1846, when it was lowered to 3 per cent. These rates being governed by the flow of bullion, which diminished from 15½ millions, when the Act of 1844 passed, to 13½ millions in November, 1845; after which it increased again to above 16 millions in August, 1846, and then began steadily to decline, till it reached its minimum in the great crisis of October, 1847.

240. The first failure of the potato crops in Ireland in 1845, and the railway mania of that year, must be in the recollection of most of our readers and need not be detailed here, nor had they anything to do properly with the management of the Bank, whose sole duty it was to look to its own affairs, and preserve its own stability. The calamity of 1846 was far more severe and extensive than that of the preceding year. It was absolutely certain that an immense quantity of bullion would require to be exported in payment of the grain it would be necessary to import. Accordingly, from the middle of September, 1846, a steady and continuous drain of bullion set in, but the Bank made no alteration in the rate of discount until the 16th January, 1847, when the bullion had fallen to £13,949,000, it raised the rate of discount to $3\frac{1}{2}$, and on the 23rd the bullion having been further diminished by £500,000, it raised the rate to 4 per cent. Henceforth the drain continued rapidly, but the Bank still continued to make no alteration until the 10th April, when the bullion having fallen to £9,867,000 the rate was raised to 5 per cent. Here we have the same inveterate blunder committed by the Bank as on so many previous occasions—an immense drain of bullion, and yet none but the most feeble, inefficient, and puerile means taken by the Bank to raise the value of money here. But the operation of the Bank at this time is an excellent example of the self-acting nature of the Act of 1844. We need only observe that the banking capital of the Bank of England at this time was £14,000,000, based upon public securities, together with notes representing as much bullion as there is in the issue department. Consequently the notes held in reserve must always be equal to the difference between the notes in circulation, or held by the public, and the sum of £14,000,000 added to the quantity of bullion. Now we have seen that the intention of the framers of the Act of 1844 was, that, as the bullion diminished, the notes in the hands of the public should be diminished in conformity to the "currency principle." Now what did the directors do? Instead

of reducing the notes in circulation, or held by the public, they threw the whole diminution on their own reserves! On the 29th August, 1846, the notes held by the public were £20,426,000, the bullion was £16,366,000, and the notes in reserve were £9,450,000; after this a very severe and continuous drain of bullion took place, but no perceptible alteration whatever was made in the notes in circulation, but the notes in reserve rapidly diminished. On the 10th April, 1847, the notes in circulation were £20,243,000, the bullion was £9,867,000, and the notes in reserve £2,558,000. Consequently nothing could be a more total and complete failure of the Act of 1844, on the very first occasion its services were required.

241. The number of notes held in reserve in the banking department, under the new system of 1844, corresponded in effect very much to the amount of the bullion held by the Bank before its division. When, therefore, the public saw that the whole banking resources of the Bank were reduced to £2,558,000, a complete panic seized both the public and the directors. The latter adopted measures of extreme severity to check the demand for notes. The rate was raised to 5 per cent., and this was made applicable only to bills having a very few days to run, and a limit was placed upon the amount of bills discounted, however good they might be. Merchants who had received loans were called upon to repay them without being permitted to renew them. During some days it was impossible to get bills discounted at all. These measures were effectual in stopping the efflux of bullion, and a sum of £100,000 in sovereigns, which had been actually shipped for America, was relanded. During this period the rate of discount for the best bills rose to 9, 10, and 12 per cent. During all this time the price of wheat continued steadily to rise, notwithstanding the monetary pressure; and at the close of May, the price on one occasion reached 131s. in the Windsor market. The foreign exchanges, which had been adverse to the country during the latter part of 1846, and the beginning of 1847, from the immense quantity of foreign corn which was imported, became favourable in the middle of April, partly owing to the great monetary pressure.

242. The pressure passed off after the first week in May, having lasted about three weeks, and bullion began to flow in after the 24th of April, until, at the end of June, it amounted to £10,526,000, the notes in circulation being £18,051,000, and the notes in reserve £5,625,000.

243. The conduct of the Bank in keeping down the rate of discount, when a rapid drain was going on, and the foreign exchanges were unfavourable, was the exact counterpart of what it had done on so many previous occasions, and excited much comment and adverse criticism by the whole commercial community of London. The market rate rose decidedly above it, so that a rush for discounts was made to the Bank, which were no sooner obtained in notes, than the holders of them went immediately to the issue department to demand gold for them. But we have noticed in the preceding account one fact of immense importance. *The Bank raised the rate of discount, and gold which had been already shipped was relanded.* This is a decisive instance of the doctrine we have

proved, *that the rate of discount is the true mode of controlling the paper currency and the movements of bullion.* (*Elements of Political Economy, chap. V. Theory and Practice of Banking, chap. XIII. DISCOUNT.*)

244. The enormously high price of grain, which had no parallel since 1812, had the natural effect of tempting a great number of houses to enter into speculations for the import of grain, far beyond their power to support. The enormous importations in May, June, and July, coupled with the very favourable appearance of the harvest, caused a heavy and continuous fall in the price of grain, and the reports of the potato crop being very favorable, the price of wheat fell to 49s. 6d. in September. This tremendous fall in the price of wheat was fatal to the houses which had speculated in it. Moreover, that hideous nuisance which always flourishes with noxious luxuriance in times of speculation—accommodation paper—was extensively prevalent. The failures in the corn trade began in August, and continued to increase in number and magnitude till past the middle of October.

245. As we have given a full account of this great crisis in its proper place (*CRISIS, COMMERCIAL*), we shall not enlarge upon it here. It is sufficient to say that from Monday the 18th to Saturday the 23rd it was at its height;—that for a considerable time the Bank attempted to carry out the restrictive policy as they had done in 1825, and that at length the ministry took upon themselves to advise the Bank to break through the provisions of the Act, and advance notes freely wherever they judged it prudent, but at a very high rate of discount—not less than eight per cent.—and that this policy was completely successful, and immediately allayed the panic. Thus following exactly the principles of the Bullion Report.

246. The ministry having authorized the Bank to commit a breach of the Act, felt bound to meet Parliament as soon as possible. In the debate that took place, Sir Robert Peel felt particularly called upon to come forward and defend the Act of 1844. After defending himself from some minor charges, he protested against singling out individual members of Parliament, and making them responsible for the acts of the whole legislature. He said that some persons alleged that the Act of 1844 had been passed without due inquiry, but he recounted the committees that had sat for five years, and had asked upon the whole upwards of 14,000 questions—questions and answers without end—but with no practical result from those apparently interminable investigations. The last committee had closed its labors without any practical results. At last the ministers determined to bring forward a measure on their own responsibility, which had been carried by extraordinary majorities; but nevertheless, if it could be shown that the Act of 1844 could be amended, that it ought to be done. He said, "There has been some misapprehension respecting the objects of this Act. *I do not deny that one of the objects contemplated by the Act was the prevention of the convulsions that had heretofore occurred, in consequence of the neglect by the Bank of England to take early precautions against the withdrawal of its treasure.* I did hope, that although there was no imperative obligation on the

Bank of England to take these precautions, that the experience of 1825, 1836, and 1839, would have induced that establishment to conform to principles which the directors of the Bank acknowledged to be just, and which they had more than once professed to adopt for their own regulation. Sir, I am bound to say that in that hope, that in that object of the bill, I have been disappointed. I am bound to admit, seeing the extent of commercial depression which has prevailed, and the number of houses which have been swept away, some of which, however, I think were insolvent long before the bill came into operation, and others of which became insolvent in consequence of the failure of those who were connected with them, and were imprudent in their speculations, I am bound to admit that that purpose of the Bill of 1844, which sought to impress if not a legal, at least a moral obligation on the Bank to prevent the necessity for measures of extreme stringency by timely precautions; has not been fulfilled. Sir, I must contend that it was in the power of the Bank, if not to prevent all the evils that have arisen, at least greatly to diminish their force. If the Bank had possessed the resolution to meet the coming danger by a contraction of its issues, by raising the rate of discount, by refusing much of the accommodation they granted between the years 1844 and 1846—if they had been firm and determined in the adoption of these precautions, the necessity for extrinsic interference might have been prevented, it might not then have been necessary for the government to authorise a violation of the Act of 1844. * * * The Bill of 1844 had a triple object. *Its first object was that in which I admit it has failed, namely, to prevent by early and gradual, severe and sudden contraction, and the panic and confusion inseparable from it.* But the Bill had at least two other objects of at least equal importance—the one to maintain and guarantee the convertibility of the paper currency into gold; the other to prevent the difficulties which arise at all times from undue speculation, being aggravated by the abuse of paper credit in the form of promissory notes. In these two objects my belief is that the Bill has completely succeeded. My belief is that you have had a guarantee for the maintenance of the principle of convertibility such as you never had before. My belief also is, that whatever difficulties you are now suffering from a combination of various causes, those difficulties would have been greatly aggravated if you had not wisely taken the precaution of checking the unlimited issues of the notes of the Bank of England, of joint stock banks, and private banks." Sir Robert Peel then entered into a most able description of the true evils the country was suffering under, which arose from the enormous destruction of capital by the dearth of food, and the unusual absorption of capital in one channel of commerce, the construction of railroads, which were not yet remunerative. He shewed the absurdity of expecting to have cheap money, while capital was scarce. He cordially approved of the course the Government had taken in not issuing the letter sooner than they did, and in doing it when they did. *THUS AT ONCE ABANDONING THE CURRENCY PRINCIPLE, and going back to his old opinion that the Bank of England ought to extend its issues in times of commercial crisis.* "The true remedy for

the state of things the country was suffering under was individual exertion, the limitation of engagements, the cessation of all demands which could be postponed; an earlier issue of the letter would have relaxed these necessary exertions. But to that pressure a panic succeeded, which could not be provided against, or foreseen by legislation, which could not be reasoned with, and which could only be met with by a discretionary assumption of power by the Government suitable to the emergency. Whether any modification of the Act of 1844 was desirable was a question for future consideration. His own opinion was in favour of the maintenance of the great principles of that measure. If the identical restrictions were not imposed upon the Bank as were then in force, still there must be some restrictions, for after the experience of 1825, 1836, and 1839, he, for one, would not be content to leave the regulation of the monetary concerns of this country to the uncontrolled discretion of the Bank. In 1844, the general conviction was that it ought not to be so left, and he for one knew no better mode of imposing restriction than that which was devised by the Act of 1844."

247. Both Houses of Parliament appointed Committees to inquire into the causes of the commercial crisis. The Committee of the Commons presented their Report on the 8th June, 1848. It entered into no scientific examination of the correctness or the contrary of the opinions of the witnesses; it aspired to, and attained, no higher function than that of acting as a kind of preface to the mass of evidence, but concluded by stating the opinion of the Committee, that it was not expedient to make any alteration in the Act of 1844. The Report of the Committee of the Lords was a much more elaborate production. It not only examined the evidence at considerable length, but pronounced an opinion of its own, and recommended that the Act should be so far amended as to introduce a discretionary relaxing power, which was only to be exercised during the existence of a favourable foreign exchange.

248. After the severe medicine which the body commercial was subjected to by the great crisis of 1847, which there can be little doubt was of great service, by removing houses that had been insolvent for years, the commerce of the country was established on a sounder footing, and for several years proceeded with great prosperity. In 1854 war was declared with Russia, and the seat of it being principally in the Black Sea, a great demand for shipping arose, which, as usual, caused much speculative dealing in that species of property. This occurred especially at Liverpool in the autumn of 1854, and led to some very extensive failures. The revelations which ensued from these failures, disclosed that the same inveterate and abominable practices of accommodation paper were again rampant. Fictitious bills to an enormous extent were fabricated among persons who were in the same species of business, and were negotiated all over the kingdom. Nor were the evil effects of these frauds confined to Liverpool, or to that time. Banks all over the kingdom were victimized by this gang, and a great establishment in that town was deeply and irretrievably injured, and fell in 1857, being one of the causes of the panic in that year. Moreover, the discoveries of

gold in Australia led to a vast overtrading to that country, and caused great embarrassments among that class of traders. In June the bullion in the Bank stood at £18,169,000, when an extremely severe drain began, and by the 13th October it was reduced to £11,752,000, which is by far the severest on record. What the causes of this were it does not concern us to inquire. The only thing that concerns us is the conduct of the Bank. On this occasion it acted with a promptitude and decision most favorably contrasted with its former errors. The rate of discount was rapidly raised to enhance the value of money; on no former occasion was the rise so rapid and extensive in so short a time, but the effect produced was most salutary; although there was a considerable pressure, there was no panic. In order to show clearly the different mode of action adopted by the Bank, we may give the following figures:—

		Bullion in the Issue Department. £	Minimum Rate of Discount.
1855.			
January	4	13,180,835	5
"	20	11,880,580	5
Feb.	22	12,313,230	5
March	22	13,479,975	5
April	12	14,392,500	4½
May	3	14,791,785	4
"	17	15,386,510	4
"	31	16,337,685	4
June	14	17,056,945	3½
"	28	17,429,435	3½
July	19	16,631,890	3½
August	9	15,601,590	3½
Sept.	6	14,368,010	4
"	13	13,668,005	4½
"	27	12,695,250	5
October	4	12,363,255	5½
"	18	11,205,855	6
		per cent. for bills not longer than 60 days.	
Nov.	8	10,741,320	7
		for 95 days.	
Dec.	6	10,580,510	
"	27	10,369,595	

On the 29th December the *Economist* said, "The money market continues as stringent as it can well be, and no bills can be discounted under the Bank rates. Paper at long dates cannot be discounted on any terms. The great extent of our trade, as indicated by the returns for November, confirms the suspicion awakened by the continued demand for money, that trade has received no serious check from the advance in the rate of discount, and is still more extensive than prudence warrants, or in the end will be justified."

249. This most judicious conduct on the part of the Bank, which merited nothing but the most unqualified commendation, excited a great clatter amongst a certain number of people, who think that money is to be created *ad libitum* by writing "promises to pay" on bits of paper, when there is no money to pay them with, and who think it possible to send one's money abroad, and also to have it at home. The papers were filled for weeks with letters and articles exhibiting all the rank follies which were once prevalent on the subject of the price of corn, and which have been so admirably exposed by Adam Smith. But in this respect, a most marked and healthy change has been of late years most manifest in the ma-

majority of public writers. The great majority now understand that the rate of discount is the true regulating power of the paper currency, and instead of assailing the Bank with howls and execration when it does its duty in raising its rate, they, with a few exceptions, now universally commend it. This is great, real, and sound progress in the spread of true economic science.

250. At the end of this year the Queen exercised the power reserved in the Act of 1844, to enable the Bank of England to extend its issues to not more than two-thirds of the amount of those of any banks of issue that might cease to issue notes. From the passing of the Act up to this period forty-seven banks, whose authorized issues amounted to £712,623, ceased to issue their own notes, and on the 13th December, 1855, the Queen in Council issued an order authorizing the Bank of England to increase its issues to the amount of £475,000 upon public securities. But this is not the entire *bonâ fide* increase to the issuing power of the Bank. For in the year 1854 the clearing house was organized on a better plan (CLEARING HOUSE), and whereas before that, an average amount of £200,000 of bank notes were required to adjust its transactions, by the new system these were totally dispensed with, and no notes at all are now required. Moreover, by the admission of the joint stock banks to the clearing house, they are saved from keeping an enormous amount of notes to meet the "bankers' charges," which may safely be calculated at £500,000. These notes, therefore, are now available to the Bank to use for commercial purposes, and consequently are to be considered as so much additional power of issue to the Bank, which has thus in reality acquired an increased power of issue to the amount of £1,175,000, since the Act of 1844. Up to February, 1857, seven other banks, whose aggregate issues amounted to £111,020, have ceased to issue notes, but no further power has yet been granted to the Bank to extend its issues.

251. For several months after the beginning of 1856, the money market continued in a state of great "tightness," and the bullion in the Bank scarcely varied. The lowest was on the 26th April, when it stood at £9,081,675; after that it gradually rose, and the rate of discount fell in summer to about $4\frac{1}{2}$ and $4\frac{1}{4}$, but in October the bullion fell very considerably again, and discount rose to 7 and 8 per cent., and a pressure followed, of about the same severity as in 1855, and continued with very little variation to the end of the year.

252. The year 1857 opened with money at a comparatively high rate, which gradually somewhat abated, but after a temporary relaxation, discount in April rose again to 7 and 8 per cent. The bullion continued all the time in a low and unsatisfactory condition, owing to the extraordinary activity of trade, and the demand for it for foreign enterprises. Trade in this year assumed that sudden and unusual increase, which ample experience now enables us to pronounce is always to be looked upon as a dangerous symptom, and as a sure precursor of a crisis. However we shall not repeat here what we have said elsewhere, (CRISIS, COMMERCIAL) where the pathology of this crisis is fully detailed. There is nothing which in a banking point of view calls for special remark during the summer. In the middle of September

the news came from America of the stoppage of the *Ohio Life and Trust Company*, which had always been held in good estimation, and had paid a good dividend a few days before it closed its doors. Its business appears to have been to make advances on the shares of public companies, somewhat similar to the *Crédit Mobilier* of Paris. In the beginning of October, the Bank raised its discount from $5\frac{1}{2}$ to 6 per cent., and on the 10th to 7 per cent. The news then came of further failures in America, and discount rose rapidly in all the continental markets, at Hamburg to 9 per cent. On the 17th, the Bank raised its discount to 8 per cent. By this time the panic had fairly begun. In the week ending October 31, the news came that all the banks of New York had suspended cash payments in a body, and the Borough Bank of Liverpool, and a great many other houses connected with the American trade. On Thursday, November 5, the Bank raised its discount to 9, and on the following Monday to 10 per cent., but matters only became worse and worse. On the 9th November the Western Bank of Scotland stopped payment. The panic spread to London; Sanderson & Co., the bill brokers, stopped, with liabilities exceeding £3,000,000, and a run was beginning on the joint stock banks. They nearly all stopped discounting. On Wednesday, November 11, the bullion in both departments of the Bank was reduced to £7,170,508, and the reserve of notes to £957,710. To shew how greatly more severe the strain upon the resources of the Bank was in 1857 than in 1847, we may observe that when the government letter in the latter year was issued, the reserve of notes was still £2,155,000. On Thursday, November 12, the Bank and all its branches commenced business with resources only amounting to £957,710, being considerably less than the amount it had in cash when it stopped payment in 1797, and lower than it was even reduced to in 1825. At the close of the day, the whole reserve of the Bank and all its branches in notes and coin was £581,000, being £131,000 in notes, £358,000 in gold, and £92,000 in silver coin; of which £384,000 was in London. There could be but one result. *Immediate and universal failure.* On this day, the government sent a letter to the directors of the Bank, recommending them, if necessary, to disregard the provisions of the Act of 1844, and to make advances to any amount they deemed necessary, upon approved security, but at a rate of discount not less than 10 per cent. The directors immediately acted upon this recommendation, and the panic was immediately allayed! Exactly as had happened on several previous occasions, and as the Bullion Report had declared ought to be done. Nor are we saying anything too strong, when we say that universal failure would have ensued if the Act had not been suspended, for Lord Overstone himself, the chief supporter of the Act of 1844, said in the House of Lords that if it had been maintained twenty-four hours longer the whole of the joint stock banks of London would have been swept away.

253. The issues made by the Bank in consequence of this letter also proved how much more severe this crisis was than the preceding one. In 1847 the issues after the receipt of the letter only amounted to £400,000, and no infringement of the Act took place; in 1857 the issues in consequence of the letter exceeded the

amount authorized by the Act by £2,000,000; and immediately on the meeting of Parliament, an Indemnity Act was passed to protect the directors from the penalties of the Bank Act of 1844. That Act was suspended until the 1st of February, but it was provided, that if the directors reduced their discount below 10 per cent. it should immediately revive again, and the notes must be reduced to their legal limits. The severity of the crisis immediately turned the exchanges in favor of the country, and gold began rapidly to flow in; and on Thursday, December 24, the Bank reduced its discount to 8 per cent., thereby immediately reviving the operation of the Act of 1844.

254. In 1858 the inevitable consequences followed from the great crash of 1857. The enormous mass of false trading being cleared away, money naturally flowed into the Bank, and the quantity of bullion gradually and steadily increased up to the end of the year. We may give the following figures which shew distinctly the connection between the bullion and the rate of discount—they exhibit all the changes in the rate which took place during the last year.

1858.	Coin and Bullion.	Discount.
Jan. 7	£12,648,193	6
" 14	13,357,107	5
" 28	15,396,724	4
Feb. 4	15,793,696	3½
" 11	16,574,647	3
Dec. 3	18,921,171	2½

For a very considerable period before the Bank made this last change, the general market rate had been 2½, while the Bank kept their rate obstinately fixed at 3 per cent., no one could tell why. At last, however, having maintained this extraordinary policy for about ten weeks, they were obliged to comply with the laws of nature, and lower their rate to 2½ per cent. The figures in the above table contrast most favourably with those which appear in 1847, for while we find that in 1847 the bullion had fallen to £9,867,000 before discount was raised to 5 per cent., in 1858, that rate of discount was maintained at that rate until the bullion exceeded £15,000,000—a great advance in sound principle. This year passed away in great tranquillity, persons not yet having forgotten the lesson of 1857. But we cannot doubt, judging by all former experience, that an uneasy spirit will soon be abroad again; we cannot doubt that the brood of speculators are now anxiously casting about to see if they can plant the seeds of the next crisis, and it is the duty of those who are now at the head of monetary affairs to be on the watch to counteract all such attempts as they can detect; and in the meantime the most interesting question at the present time, in a banking point of view, is—What is to be the next mania?

On the Rise and Progress of Joint Stock Banking in England.

255. It is very commonly supposed that Joint Stock Banks were not permitted by law in England before 1826, nor in the metropolis till 1833, but the preceding narrative shews that this idea is incorrect. By the common law, joint stock companies of all sorts, including of course banks, are perfectly legal, and consequently, if we wish to have a correct idea of the matter, we must observe this, and then ascertain what

changes and modifications were made in the common law by successive Acts of Parliament.

256. Although the first joint stock mania in England took place in 1694, no one at that time thought of getting up a joint stock bank, in fact, joint stock bank shares are the very last things any one would think of getting up as a mere speculation. When the Bank of England was founded, it received no monopoly in its favor, and it was only in 1697, after the disastrous failure of the Land Bank Scheme, and the ruin of public credit, that the Bank was enabled to obtain a monopoly. But even that did not affect the common law right to establish such institutions, it only said that no rival bank should be erected or countenanced by Parliament. None, however, were formed; but, in 1708, another company began doing banking business by issuing notes. The Bank then, in 1709, obtained the clause in the Act of that year prohibiting any company of persons exceeding six in number, from "borrowing, owing, or taking up money on their bills, or notes payable to bearer on demand," which we have shewn was the well understood meaning of the word "banking" at that time. This clause was effectual up to 1742, when in the Act of that year, it was re-enacted in much more full and explicit terms. But still the restriction was confined to borrowing, or owing, money on their bills, or notes. Consequently the new method subsequently introduced of creating liabilities by means of entries and cheques, which was borrowed from the Dutch by our bankers, was not affected by the restrictive words of the Act. As soon, therefore, as the London bankers discontinued their issues of notes, and adopted entries and cheques, there was no law whatever to prevent joint stock banks being formed, and carried on by that method. This, however, completely escaped observation, and we can have very little doubt that if this flaw in the monopoly had been discovered, and an attempt made to take advantage of it, Parliament would immediately have put it down, as there can be no possible doubt, but that it was their manifest intention to create a complete and effectual monopoly on behalf of the Bank, and protect it from any rival banks of any sort whatever. The effects of this monopoly, however, were most disastrous. Bank of England notes had no circulation beyond London, and it would not establish any branches in the country. No other powerful and wealthy banks could be formed, the consequence was, that when enterprise awoke in the country in the last quarter of the last century, and there was a great demand for an increased currency, all sorts of petty tradesmen in all directions, grocers, linendrapers, cheesemongers, tailors, &c., started up, and turned "bankers," i.e., issuers of promissory notes, so much so, that in 1793, there were about 400 of these country "bankers." But of course this paper currency was of the most rotten description, and on the occasion of any great commercial crisis, they failed by dozens. In the great crisis of 1793 no less than 100 stopped payment, and double that number were greatly shaken. In 1810 about a similar number stopped, a great number in 1812; and in the three years, 1814-15-16, ninety-two commissions in bankruptcy were issued against banks; and, allowing the usual

proportion of four suspensions to one bankruptcy, in those three years alone about 360 banks stopped. In twenty-eight years, from 1791 to 1818, the official return shews that 273 commissions were issued against bankers, or we may fairly assume that upwards of 1000 banks stopped payment during that period. The intolerable hardship of the monopoly of the Bank Charter may be conceived, when the Bank, doing no business itself at such places as Bristol or Liverpool, no powerful bank could be formed at these places, on account of it. These enormous failures among the country bankers, spreading ruin and desolation throughout whole districts of country, naturally turned public attention to the Scotch system of banking, where, with the single exception of the Ayr Bank, there had been no failure of a joint stock bank. Mr. Joplin is the earliest person that we are aware of, who discovered that the Charter of the Bank of England did not prevent banking companies being formed, which did not issue notes (JOPLIN). In a pamphlet, entitled *Supplementary Observations to the Third Edition of an Essay on Banking, &c.*, 1823, he says, p. 84, "That public banks have not hitherto existed, more especially in London and Lancashire, seems to have arisen from the want of a proper knowledge of the principles of banking, rather than from the Charter of the Bank of England, which I find, does not prevent public banks for the deposit of capital from being established * * * *". That banks ought to be the permanent depositories of the capital of the country, is an idea which no writer has hitherto entertained, and the silent operations of the Scotch banks have eluded observation. It has, in fact, always been hitherto considered, that the proper business of a bank was to issue notes and discount bills at short dates. This is very strikingly exemplified by the clause in the charter of the Bank of England, which restricts other banks to six partners." (Mr. Joplin then quotes the clause, and says,) "It is quite evident that the framers of the above clause considered the business pursued by the Bank of England, the only proper banking. It appeared to them that preventing banks with more than six partners from issuing bills at short dates, or notes payable on demand, was altogether conferring on the Bank the privilege of exclusive banking as a public company. *This it did no doubt according to their definition of the term, but it still leaves the most important part of banking open to the public. There is at this moment no legal impediment to the establishment of joint stock companies for trading in real capital.* Both the letter and the spirit of the charter has reference to the circulation of bills and notes alone. A bank which traded only in capital, would not in the least touch upon the monopoly of the Bank of England, nor be any infringement of its charter." Thus Mr. Joplin has, as far as we are aware, the merit of perceiving the loophole in the Act, by means of which, ten years later, the first Joint Stock Bank was established in London.

257. An attempt in 1823 to gain the consent of the Bank of England to give up the privileges of their Charter, so far as to permit joint stock banks to be formed in the country, having failed, even though a bribe was offered, nothing further took place till 1826, when the disasters of the

preceding year being very generally attributed to the improper management of the country banks, the ministry were powerful enough to compel the Bank to give up its unjustifiable monopoly, and at length agreed to permit joint stock banks to be formed beyond sixty-five miles from the metropolis. The Statute 1826, c. 46, was passed for this purpose. Its chief provisions are—

I. That banks of an unlimited number of partners may be formed, and carry on all descriptions of banking business by issuing notes and bills payable on demand, or otherwise, provided that such corporations or partnerships should not have any house of business or establishment as bankers in London, or at any place within sixty-five miles of London; and that each member of such corporation, or partnership, should be liable for all its debts of every description, contracted while he was a partner, or which fell due after he became a partner.

II. No such banking company was to issue or re-issue, either directly or indirectly, within the prescribed distance, any bill or note payable to bearer on demand, or any bank post bill, nor draw upon its London agents any bill of exchange payable on demand, or for any less sum than £50, but they might draw any bill for any sum of £50 or upwards, payable in London or elsewhere, at any period after date, or after sight.

III. Such banking companies were expressly forbidden, by themselves or their agents, to borrow, owe, or take up in London, or at any place within sixty-five miles of London, any sum of money, on any of their bills or notes payable on demand, on at any less time than six months from the borrowing thereof, but they might discount in London, or elsewhere, any bill, or bills, of exchange, not drawn by, or upon, themselves, or by, or upon, any person on their behalf.

IV. Before such a company began business, they were to make a return of the names and addresses of all their partners, and places for carrying on business, and the names of two or more of their partners, being resident in England, who were to be appointed public officers, and in whose names the company were to sue and be sued, which return was to be verified by oath. And they were required to make returns of all changes in their body.

V. That all proceedings at law and in equity, civil and criminal, should be taken by and against the public officers of the company. All decrees and judgments obtained against such public officers should be valid against all and every member of the company; and execution upon a judgment against the public officer might be issued against any member of the company. But that every such public officer or person, against whom such execution was issued, should be fully indemnified by the other members of the company; but that no execution should issue against any person, more than three years after he had ceased to be a partner.

VI. The Bank of England was authorized to establish branches at any place in England.

VII. Such banking companies might issue unstamped notes upon giving certain security to the Crown, to make true returns of the amount of their issues, and to pay the amount of stamp duty on them; and they were not obliged to take out more than four licences for issuing notes in different

places. For any breach of these provisions in neglecting to send returns, the penalty was £500 per week, and various penalties were exacted for false returns. And every breach of the provisions relating to their banking business subjected the company to a penalty of £50.

VIII. The rights and privileges of the Bank of England were to remain intact and unaltered, except so far as varied by that Act.

258. Subject to these restrictions upon their business, this Act made no provisions regarding the constitution or capital of these companies. Each one was allowed to devise a constitution for itself, to name its own capital, and to make any public announcement regarding it that it pleased. The formation of joint stock banks under this Act proceeded very slowly at first, not more than four or five being formed in as many years. In fact, such banks could only be successfully formed by influential persons, and of course each of these had already his own bank, which he would naturally be unwilling to injure by the formation of so powerful a rival. The first joint stock bank was formed at Lancaster, the next at Bradford, and another at Norwich, before any one was formed at one of the great manufacturing towns. It was not till the prosperous years of 1833-34-35-36, that any very remarkable increase took place in their numbers. In these years, however, they multiplied rapidly, more especially in 1836, when upwards of forty were established in the spring.

259. On the renewal of the Bank Charter in 1833, it was determined to take off the vexatious restriction of preventing banking companies making their bills and notes for less than £50, payable on demand by their agents in London. And they were required to keep weekly accounts to be verified on oath, of the amount of their notes in circulation, and make a return to the Commissioners of Stamps of the average amount in circulation every quarter.

260. It was at this time, as we have already noticed, that the discovery made in 1822 by Mr. Joplin, that the Bank charter did not prohibit joint stock banks being formed in London, and carrying on their business on the method then adopted by the London bankers, attracted attention, and on the case being submitted to the law officers of the crown they confirmed this view. The flank of the monopoly of the Bank of England, as we may say, being turned in this extraordinary and unexpected manner, excited much consternation and alarm in that body, and they requested to have this omission rectified, but Lord Althorp decidedly refused anything of the sort, and told them that the bargain was that their privileges should remain as they were, and he would not consent to any extension of them. To remove all possible doubts on the subject, a declaratory clause was inserted in the Bank Charter Act, expressly permitting Joint Stock Banks to be formed, provided that they did not borrow, owe, or take up in England any sum or sums of money on their bills or notes payable on demand, or at any less time than six months from the borrowing thereof. This declaratory clause was not long in being acted upon; and soon after the Act was passed, measures were taken to constitute a joint stock bank in London. This was the London and Westminster Bank,

which has since been managed with such distinguished success.

261. The enormous difficulties which must have attended the successful organization of this great establishment may be conceived, when we remember that it was not formed under the Joint Stock Banking Act at all, which had no force within sixty-five miles of London, but that it was nothing but an ordinary partnership at common law. One of the least of the inconveniences of this was that it could not maintain an action at law for the most trivial debt, without enumerating all and each of the partners, and the slightest mistake in the spelling of a single name would at that time have vitiated any proceeding. This bank was the largest common law partnership which has existed in England; and all the London joint stock banks which were formed before the Act, Statute 1844, c. 113, are nothing but common law partnerships. The excessive inconvenience attending this state of things, led to a bill being brought into Parliament to enable the London and Westminster Bank to sue, and be sued, in the name of its chairman. This was warmly opposed by the Bank of England, and by Lord Althorp. Nothing could be more paltry than the reasons alleged by him in opposition to it, but he was beaten by a majority of 141 to 35. The government, however, had influence enough to have the bill thrown out in the Lords. The Bank being thus defeated, adopted the plan of making all contracts through the medium of trustees, and all the London joint stock banks had to adopt this plan, till the Joint Stock Banking Act of 1844. The other banks formed on a similar plan to the London and Westminster, are the London Joint Stock Bank, founded in 1836; the Union Bank in 1839; the London and County Bank in 1839; and the Commercial Bank in 1840.

262. When the impediments to the formation of joint stock banks beyond sixty-five miles from London were removed in 1826, they were left perfectly free as to the provisions of their deeds of constitution, their nominal and their paid-up capital, and all the details of management, nor were they obliged to publish any accounts. The public consequently were perfectly in the dark as to the magnitude and position of the bank, because they might advertise that their nominal capital was £1,000,000, divided into any number of shares. But no one had any means of knowing how many of the shares were taken and paid upon. Consequently, although the capital of the bank might be advertised in the papers as £1,000,000, no one could tell whether it had *bonâ fide* £500 paid up.

263. The first few joint stock banks having been apparently successful, naturally turned speculation into that channel. Numbers of new banks were started in all parts of the country, and many private bankers, fearing that the competition would be too powerful for them, united and formed themselves into joint stock banks. The rapid growth of these establishments led to much mismanagement, and many disasters, as might have been expected, and Committees of the House of Commons were appointed to inquire into the subject in 1836-7 and 1840-1. These reports are noticed in their proper place. (REPORTS, PARLIAMENTARY.)

264. The great abuses which were revealed in the course of these inquiries determined Sir Robert Peel, who was supposed to be the minister who *par excellence* understood banking, to bring in a bill to regulate the future constitution of these establishments. An Act containing many elaborate provisions for this purpose was accordingly passed, Statute 1844, c. 113. Fully admitting the enormous evils which this Act was intended to remedy, we will only say that a more unfortunate specimen of legislation, or one more entirely unsuitable to the nature of the business it related to, has not emanated from Parliament in recent times; and being found to be an unmitigated nuisance, without any counterbalancing advantages, it was wholly repealed in 1857.

265. When, in the course of less than thirty-five years, men had seen the whole of England shaken, from end to end, by those tremendous banking catastrophes, which seemed to be of periodical recurrence, they turned to the example of a country, where, though there had been commercial difficulties, there never had been any banking disasters at all comparable to those of England. Many private bankers, it is true, had failed, but except the Ayr bank, up to 1826, no joint stock bank in Scotland had failed. A very strong and general demand therefore arose for the Scotch system, many men thinking that because the Scotch banks were joint stock banks, that therefore joint stock banking was all that was requisite to attain security. When therefore the monopoly of the Bank was to a certain extent broken up in 1826, they expected to enjoy similar prosperity and safety to what Scotland had done, and when after an experience of fourteen years, they found that the joint banks were scarcely more secure, and equally ill managed as the private banks, great and bitter disappointment ensued, and joint stock banking became a bye word of reproach.

266. But in truth the causes of this are very evident. In Scotland the growth of banking had been extremely gradual. The first joint stock bank was founded in 1695, the second in 1727, the next in 1747, and except a few country ones, no new one of any magnitude was founded till 1810 (BANKING IN SCOTLAND). The consequence was that they gradually expanded with the increasing wealth of the country. They grew with its growth. Moreover, they correspondingly increased their capital. They acquired great experience, after committing many errors, which brought them to the brink of destruction. When the country required additional accommodation, it was done chiefly by throwing out branches from the parent establishments in the metropolis, so that they had all the experience and effective controul of the superior officers. At present, there are but fourteen distinct establishments in the country, but these have about 600 branches, extending into every village in the kingdom, so that banking accommodation is ample and abundant. But these are all independent institutions, depending upon their own wealth and resources, and except perhaps in the case of a sudden run upon one of them, never seeking assistance from each other. To suppose that the English system of joint stock banking bore any similarity to this would be a most egregious fallacy, and it was this difference chiefly which led to those disastrous consequences which so completely falsified the expectations

which were formed on the introduction of joint stock banking into this country.

267. There are in truth laws of nature in the industrial world, as well as in the moral and physical world; and a systematic attempt to violate these terminates in disaster, as surely and as certainly as a systematic disregard of the laws of nature in the physical world. It may be a long time before the mischief is developed, nay, for a considerable time, the results may appear to be beneficial, but in the long run the faulty principle is sure to produce its fruits.

Now the great law of nature in the industrial world is **FREE TRADE**. There is nothing more certain in all the range of science, than that exclusive privileges in commerce are great violations of natural right. Trading monopolies are moral crimes. When Parliament sold to the Bank of England the exclusive monopoly of Banking, it **SOLD WHAT IT HAD NO RIGHT TO SELL**. It had no more right to sell to one body of persons the right of carrying on the business of banking than it had to sell a monopoly of the business of bookselling, or leather dressing, or any other trade whatever. This monopoly was as unjust and as pernicious as any of those which the Commons of Elizabeth and James I. had rebelled against. For a considerable period everything seemed to go well. The Bank of England rendered unquestionable services to the State—so might any other trading corporation in its line—and any other corporation might have done the same, if they had been permitted. But nevertheless the principle of the monopoly was utterly vicious; and Time, the avenger, brought retribution at last. Injustice slumbers long, but it is sure to have its revenge at last. When in the natural course of events the commerce and wealth, and increasing spirit of enterprise, demanded an increased currency, and, save for this monopoly, powerful and wealthy companies would have been formed in the metropolis with ramifications all over the country, these unjustifiable privileges of the Bank prevented them. The Bank would neither supply this currency itself, nor permit any other powerful company to do so. The consequence was that the duty of supplying the necessary currency fell into the hands of any grocer, or tailor, or cheesemonger who chose to call himself a banker. Their power was unlimited. Then came 1793; then 1797; then the long series of disasters from 1810 to 1816; and then 1825.

268. When these terrible lessons effected a breach in the monopoly of the Bank it was only a partial one, a large portion still remained and exercised its deadly influence. When the new joint stock banks were formed they were merely local banks, all as dependent on the Bank of England as the private banks had been. The Bank maintained its exclusive privileges within sixty-five miles of the metropolis. And this was the inherent vice of the English system of joint stock banking. Instead of being independent banks, strong in their own resources, and able of their own strength to withstand a shock, they were carried on upon the most dangerous principle of rediscounting the bills they bought, as indeed they could not help doing; thus their very existence depended upon the Bank of England and the London bill brokers.

269. To suppose that this in any way resembled the Scotch system would be a gross fallacy; the English banks were forbidden to have establishments in the metropolis, which of all others is the best feature in the Scotch system. We have already pointed out, that capital has a tendency to accumulate in certain districts of the country, where there is no sufficient demand for it, and in others there is a greater demand for it than the district supplies. Now, in the English system, the bankers in the former part of the country remit money to London to be held in deposit for them, and in the latter the bankers remit their bills to be rediscounted, and have the money remitted. Now this legitimate operation, which is all done by one establishment in Scotland, requires three distinct and independent establishments to do it in England, and has given rise to that system of rediscounting which is so perilous and so objectionable. *But it is the natural result of the monopoly of the Bank.* Because if it had not been for that, these three establishments would all have been under one controul and management; under the present system they are three different and frequently conflicting interests.

270. And this great violation of natural justice manifested its evil consequences in many other striking ways. No man of common sense now disputes the great principles laid down by the Irish Committee of 1804, the Bullion Report of 1810, and the authors of the Act of 1819, that the paper currency must be governed by the exchanges. But long after the directors of the Bank of England had learnt this principle, and professed to govern her issues by the exchanges, they complained loudly and justly that their efforts to contract their own issues in an adverse exchange were counteracted by the issues of the country banks, and that as soon as they withdrew their paper, the vacuum was immediately filled up by country issues. The reason is very manifest. The Bank of England being situated at the heart of the exchanges, felt the danger, and saw the necessity of contracting her issues; the country banks being situated at a distance, knew and cared nothing about the exchanges; nay, they continually professed that their issues had nothing to do with the exchanges, and naturally, whenever they saw an opening, issued their paper.

271. Now, if it had not been for this iniquitous monopoly of the Bank, what would probably have been the condition of English Banking at the present day? There would have probably been thirty or forty great banks in the metropolis, each as great as the present Bank of England, with ramifications and branches all over the country. It would, in fact, have been the Scotch system on a much larger scale—one commensurate with the greater magnitude of the country. It would have been one great monetary nervous system. If this had been the case, they would have been acted upon immediately by the exchanges. London being the centre of the exchanges, any drain of gold would have caused immediate measures of counteraction, which would have been propagated and enforced by the parent establishment all over the country. The tremor of the exchanges would have been instantly felt in every village in the kingdom. Thus, under a natural system, any effect in London would have vibrated through all Eng-

land, and no country banks could possibly have acted in opposition to the ones in London. And this is the result to which the banking system of this country is slowly gravitating, and which it will ultimately assume. There is already one great bank which has its head office in London, though it does no business there, with considerably upwards of one hundred branches in the country. And a few other London banks have now branches in the provinces. And if this, which is the natural system, had been allowed to grow up from the beginning, we believe that these terrible banking catastrophes never would have occurred. If any crisis had occurred, they would have stood by and supported one another, but when any shock did occur under the unfortunate system, which has prevailed, the country banks have all depended on the Bank of England for their very existence.

272. We have already said that Sir Robert Peel's Joint Stock Banking Act, Statute 1844, c. 113, was found to be wholly unsuitable for the purposes it was intended, and totally repealed. This was done by the Act, Statute 1857, c. 49. The principal provisions of this Act are as follow:—

I. Every company formed under the Acts, Statute 1844, c. 113, or the Statute 1845, c. 76, were to register themselves before the 1st January, 1858, under the said Act, under severe penalties.

II. Any banking company, consisting of seven or more persons, having a capital of a fixed amount, divided into shares also of a fixed amount, and legally carrying on the business of banking before the passing of the Act, may register itself under this Act, and then all provisions of any Act, letters patent, or deed of settlement, constituting or regulating the company, as are inconsistent with the Joint Stock Companies' Acts, 1856, 1857, or with the said Act, are thereby repealed in regard to that company.

III. The above Banking Acts were then repealed as to any future companies, and as to existing companies, as soon as they were registered under this Act.

IV. Seven, or more, persons might register themselves as a company, other than a limited company, under this Act, provided the shares into which the capital of the company is divided, are not less than £100 each.

V. The number of partners permitted in a private bank is extended to ten.

273. The question of admitting the principle of limited liability into commercial partnerships in this country, has long been debated with much acrimony. The old theory of the law was expressed by Lord Eldon, who said that a man who entered into a commercial partnership, rendered himself liable "to his last shilling and his last acre" for the debts of the company. And this no doubt was true, as far as regards ordinary private partnerships. But many great companies had been formed and incorporated, in which the privilege of limited liability was specially conferred upon them. A principle may be good when applied to ordinary traders, who are supposed all to take an active part in the business, and to be each and all parties to every transaction. But in the case of great companies it is rather different. In them the great majority of the partners are specially de-

barred from all knowledge of the real nature of the transactions, which are expressly left in the hands of a small committee. Now, as there are many great objects in commerce which can only be carried out by means of a great company, and it was obviously desirable that they should be carried out, it has long been the practice in granting Acts to these companies, to limit the liability of the shareholders. This was done in the case of the Bank of England itself; in railway and other companies, and also, almost universally, in the charters granted to Colonial banks. But for a very long time the application of this principle to private partnerships in England was vehemently resisted. However, this resistance was overcome in 1855, and in that year an Act was passed, Statute 1855, c. 133, to permit the formation of joint stock companies with limited liability. However, although the principle was conceded as to other companies, joint stock banks were still most jealously excluded, on account of some unintelligible distinction between their trading and other trading. In the Joint Stock Banking Act of 1857, this exclusion was still strictly maintained. But the terrible examples of the failure of some joint stock banks in England in 1857, at last compelled the legislature to yield, and in 1858 an Act was passed to extend limited liability to banks.

The chief provisions of this Act, Statute 1858, c. 91:—

I. So much of the last-mentioned Statute of 1857 as prevented banks being formed on the principle of limited liability, was repealed.

II. All banks which issue promissory notes are subject to unlimited liability as far as regards their notes, for which they are to be liable, in addition to the sum for which they are liable to the general creditors.

III. Every existing banking company may register itself under this Act, upon giving thirty days' notice to each and all of its customers. Any customer to whom it may fail to send notice, retaining his full rights as before.

IV. All companies formed, or registering themselves, under this Act must, on the 1st February and 1st August in each year, post up in a conspicuous place in its head office, and each branch, a statement of its liabilities and assets, made up in a form prescribed by the Act.

274. Only one joint stock bank has hitherto given notice of its intention to avail itself of the provisions of the Act. A very wide difference of opinion prevails as to the expediency and justice of banking companies with limited liability. Whether the apprehensions which are felt upon the subject will be verified, it is needless to inquire. The Act is now a *fait accompli*, and how it will work, Time, the prover of all things, will shew. It is difficult, however, to understand how a principle which has been so conspicuously successful in the Bank of England, and three of the chartered Banks in Scotland, can be so extremely pernicious as many persons allege. But it is better not to speculate upon the subject.

Historical Sketch of the Rise and Progress of Banking in Scotland.

275. The Bank of Scotland is the first instance in the world of a private joint stock bank, formed

by private persons, for the express purpose of making a trade of banking, dependent on their own private capital, and wholly unconnected with the State. It differed in kind from any of the other banks existing at that time. The successful institution of the Bank of England led to a project being formed to establish a Bank in Scotland. A merchant of London, Mr. John Holland, was the author of the scheme, and he got eleven Scotch merchants to join him. They obtained an Act of the Scotch Parliament on the 17th July, 1695, authorizing the Crown to grant them a Charter of Incorporation. The principal provisions of this Act are as follows (*Acts of the Parliament of Scotland, Vol. IX. p. 494*):—

I. The joint stock was to be £1,200,000 Scots, or £100,000 sterling, and authorizes certain persons to receive subscriptions for not less than £1,000 Scots (£83 6s. 8d.), nor more than £20,000 Scots (£6,666 13s. 4d.) for each person, with a deposit of 10 per cent.

II. They were allowed to lend on real or personal security, at not more than 6 per cent.; and on failure of payment, to sell or dispose of the security publicly.

III. They were allowed to transfer their stock freely, or by will.

IV. No dividend to be made, but by consent of general meeting.

V. The joint stock to be free from all taxes affecting money for 21 years from that date.

VI. It was declared to be illegal for any other company to set up banking for 21 years.

VII. Various legal privileges were granted for the more speedy and effectual recovery of debts due to the Bank.

VIII. Prohibits any sum to be withdrawn from the joint stock.

IX. Prohibits the company, directly or indirectly, from using or employing the joint stock of the Bank, or any of its profits, in any other trade or commerce, except the trade of lending and borrowing money upon interest, and negotiating bills of exchange.

X. Prohibits the company from purchasing land, or heritages, or advancing money to the Government, upon the anticipation of any sums to be granted by Parliament, except only those particular ones upon which a credit of loan should be authorized by Parliament, under the penalty of forfeiting triple the amount, of which one-fifth to the informer.

XI. All foreigners who subscribed to the joint stock, were *ipso facto* naturalized to all intents and purposes. It was also provided that two-thirds of the stock must always belong to persons residing in Scotland. The Scotch subscription of £800,000 Scots (£66,666) was begun in November, and filled up at the end of December, 1695. The English subscription of £400,000 Scots (£33,333) was taken up in one day in London, a great part by Scotchmen. As the Scotch at that time were supposed to know nothing about banking, it was also provided that for a certain number of years the Governor and twelve Directors should be English, and the Deputy-Governor and twelve Directors should be Scotch. However, it was soon found that the Scotch were such good managers, that this arrangement was changed, and all the Directors were Scotch, and thirteen trustees were chosen

to manage the English business and affairs in London.

276. No sooner was the Bank fairly established, than in 1696, the African Company attempted to set up the trade of banking in defiance of the Bank's privilege. This was the celebrated Darien Company, which was organized by William Paterson, who was one of the founders of the Bank of England. Mr. Holland was governor of the Bank, but so little was it thought of, that it did not venture to vindicate its privileges against the African Company, for which there was a national phrenzy, and which afterwards ended so sadly. The Bank was obliged to content itself by strengthening its position by calling up two-tenths of its capital.

277. The African company soon, however, burnt its fingers with banking, as, in order to rival the Bank, they advanced their notes with great imprudence to several of their own shareholders and others, and sustained great losses, which made them stop. The Bank then began the business of exchanges, but finding that they could not compete with private merchants, gave it up. In 1696 they opened branches at Glasgow, Aberdeen, Dundee, and Montrose; but not finding them to pay, withdrew them. In May, 1698, the rivalry of the African company being at an end, the directors repaid the two-tenths of capital, last called up, as being more than necessary for their business.

278. The Bank at first received no deposits from the public; its business consisted in circulating its own notes upon the credit of the subscription that was paid in. These notes were for £100, £50, £20, £10, and £5. It is disputed when they began to issue £1 notes, for while a pamphlet, published in 1728 on their behalf, says that they began to issue them in January, 1699-1700, Mr. Kinnear, a director of the Bank, stated to the Committee of the House of Commons that, though many proposals were made to them to circulate "tickets" or "tokens" of £1, they had always hesitated to adopt so novel an experiment till 1704. Which authority is right we have no means of deciding. In 1701 a great fire destroyed the Parliament Close, in which the bank was, but the cash and all the effects were safely removed into the Castle by the Earl of Leven, who was governor of both.

279. In December, 1704, soon after, as it would appear by one account, that they had issued £1 notes, a rumour was spread all over the kingdom that the Privy Council were going to raise the value of the coin, which caused a run upon the Bank, and at last it was obliged to stop payment. A meeting of the proprietors was held, who declared that all their notes should bear interest until they were paid. The directors also requested the Privy Council to appoint a Committee to examine their books. They reported that the Bank was in the most sound and flourishing condition, and their notes then passed without depreciation. The directors made a call of one-tenth, and in less than five months paid off all their notes with interest.

280. By the Act of Union between England and Scotland, it was stipulated that the coinage of Scotland should be reduced to uniformity with that of England, and the loss or deficiency to private individuals made good out of the equivalent

fund. (Art. xv.) The Bank assisted this operation by receiving all the old money and giving their own notes, or new money in return, receiving a commission of a half per cent. This was successfully accomplished without any disturbance.

281. In September, 1715, the rebellion broke out, which immediately caused a run upon the Bank, the directors themselves urging it on, that the money might not fall into the hands of the insurgents. They then stopped, retaining all the money belonging to the Crown, which was about £30,000, which they lodged in the Castle. They then gave notice that all their notes should bear interest, as had been done in 1704. In May, June, and July, 1716, they were all called in and paid. In this year the monopoly of banking granted by their charter expired, and no steps were taken to renew it.

282. It appears that up to this time the profits of the Bank were enormous. A rival pamphlet states that the dividend was 35, 40, and 50 per cent., and accordingly, as we may well suppose, these profits attracted rivals. A cry was got up against them, that they were too niggardly in advancing loans, that they exacted too high interest, and that the concern was altogether too small.

283. In December, 1719, proposals were made to them to unite with the proprietors of the equivalent fund, to the amount of £250,000, so as to increase the capital to £350,000, and share the annual grant of £10,000 (being four per cent. on the amount) in the proportion of two-sevenths, and five-sevenths. But, as the Bank had only one-tenth paid up, the proprietors of the equivalent fund were to draw out of the Bank, as might be agreed upon, nine-tenths, or £225,000, in notes, so that there might then be a capital of £35,000 to bank upon.

284. The Bank replied that:—1st, They had no power by their Act to amalgamate with the equivalent, as they were limited to £100,000 sterling; 2ndly, That they would not unite at par with the equivalent at four per cent., while their own stock was worth at least ten per cent.; 3rdly, That the stock of the Bank was large enough for the country; and if they wanted it enlarged, they could do it themselves by calls on their proprietors. They also gave other calculations, shewing the absurd nature of the proposals.

285. No sooner were the advances of the equivalent proprietors repuled, than another set of persons began another rough wooing, to thrust themselves into a union with them. The *Edinburgh Society*, formed on a pretended plan of insuring against fire, tried to force a junction with them, and being defeated in this, they tried to get up a run upon them. They got together £8,400 of their notes, and spread a report of a run. This, however, failed; and shortly after the Bubble Act passed, by which the Society found that they were an illegal company, and were obliged to dissolve themselves. The London Assurance Company then "proposed" to them, but met with a similar refusal.

286. At the time of the Union a considerable number of persons, both civil and military, were creditors of the State, and the equivalent sum stipulated in the Act of Union was not sufficient

to discharge their claims. In 1714, they obtained an Act of Parliament, constituting their debts, but no Parliamentary provision was made to pay it till 1719, when £10,000 was set apart for that purpose, to be paid annually, in preference to all other claims. The Act of 1719 empowered His Majesty, by letters patent, to incorporate the proprietors of this debt into a body politic and corporate—a *MORRIS*—with powers to do and perform all matters appertaining to them to do, touching or concerning the said capital sum; and the yearly fund, payable in respect thereof, as His Majesty by the said letters patent should think fit to grant. In pursuance of this Act, the proprietors, who included persons in all ranks of the State, were incorporated in 1724; and by the same letters patent, the King agreed and covenanted with the corporation that he would, from time to time, grant them such other powers, privileges, and authorities, as he lawfully might.

287. This was the body of persons whom we have seen attempt to force themselves upon the Bank of Scotland. When they were repulsed by that body, they determined to apply to the King to grant them powers of Banking in Scotland, in pursuance of his agreement to grant them any powers that he lawfully might. They accordingly petitioned him to grant them powers to bank in Scotland, limited to such of the company as should on or before Michaelmas, 1727, subject their stock to the trade of banking. This petition came to the knowledge of the Bank in 1726, and of course they did everything they could to oppose it. A cry was got up against them that they were hostile to the House of Hanover—that they charged too high interest for their loans—that they were too particular in the securities they required—that they would not lend on their own stock, and other things. To all these various charges, they, or a friend for them, elaborately replied, and they said that such a thing as two banks in one country was never heard of—that if Scotland had two England should have ten. By this time they had called up 3-10ths of their stock, or £30,000, and they alleged that that was sufficient to circulate all the credit that could be required in Scotland. They had some sound views on the subject, "For the quota of credit in a banking company must be *proportioned to the stock of specie in the nation*, learned and understood by long experience, and not extended to a capital stock subscribed for, which cannot in the least help to support the company's credit if the specie of the nation decay."

288. The call that had been made was partly paid up in the Bank's own notes, just as we have seen that the subscription to the new stock of the Bank of England was partly paid in its own depreciated notes. An outcry was made about this, but it was well answered; "But the objectors do not at all consider this point. For the payments are many of them made in specie, and bank notes are justly reckoned the same as specie when paid in on a call of stock, *because when paid in, it lessens the demand on the Bank*." He also says, "A certain stock of specie circulating in the country is needful for currency of payments in markets, and amongst the meaner sort of people, bearing a due proportion to what is running on paper credit upon the faith of the Banking Company." Excellent doctrines, in strict accordance

with the principles which made the Parliament of Scotland reject the plausible and delusive schemes of Dr. Chamberlen and John Law, for issuing paper based upon land.

289. Notwithstanding the opposition of the Bank of Scotland, the charter with powers of banking was granted to the Equivalent Company on the 31st May, 1727. The king's death on the 11th June following delayed it for a short time, but it was sealed on the 8th July. The Company took the name of the *ROYAL BANK*, and commenced business on the 8th December, 1727, with a capital stock of £151,000.

290. Granting that all the charges against the old bank were futile and groundless, we may well rejoice that the monopoly of the Bank of Scotland was not permitted to subsist. A writer, who professes to be independent of either bank, touched the right point in reply to the statement put forth on behalf of the old bank; "The power of monopolies is, I believe, an exploded doctrine. * * * Did ever any nation make an exclusive bank perpetual, or for longer than twenty-one years? Or if such an instance can be given, was the measure right? * * If the old bank should reply—We are in possession, what have we done to deserve to have our possession disturbed? The answer upon that abstract question is plain by another question—*What have we, the other subjects, done to be secluded? or by what law are we secluded from the advantages you enjoy?*" The writer then says, after comparing the rival companies, "The obvious reflection which arises from comparing these two is, that these candid and fair dealers have also dealt profitably for themselves, (as it is but reasonable that they should,) they have taken very good payment for all the services they have done to the nation, and *what title they, or any other set of men, have to an hereditary and indefeasible monopoly of banking is hard to understand.* * * * As ready as our Parliament was at the Union to accommodate petitioners, a *perpetual monopoly of banking was a thing so manifestly pernicious, that no private men could have the assurance to aim at it, far less could any Parliament be so unthinking as to grant it.*" On the south of the Tweed there was found a Parliament so unthinking as to grant a monopoly of banking to a single company for upwards of 130 years, and the consequences fully justified the opinions of the sagacious Scot.

291. The directors of the company were authorized to make calls upon the proprietors, to the amount of one half of their stock, but there were no means given of enforcing the calls beyond retaining the accruing dividends until the call was satisfied. They got, however, great assistance by having £20,000 deposited with them by the Crown. This was sent down by the government, to be placed out at interest, to assist the fisheries and manufactures, and several of the directors of the Royal Bank, being among the trustees for managing the fund, voted that it should be placed in their own bank. Their charter also granted them unlimited powers of issue. The alarm and jealousy created by the establishment of the new bank happily soon wore off, as it was discovered that so far from injuring it, the inevitable consequence followed that enlarged experience in commerce would enable us to predict; it increased the prosperity of both of them, so that the stock

of the Bank of Scotland rose to 400 per cent., and that of the Royal Bank also very high.

292. The Royal Bank had only been in existence two years, when it invented a further development of the system of banking, which, by the unanimous testimony of all persons who know that country, has done more to develop its resources, and promote its agricultural and commercial prosperity, than any other cause whatever. This is the system of *cash credits*, or *cash accounts*. This system deserves the most attentive consideration, because it is entirely of the nature of *accommodation paper*, which has fallen into such disrepute in England, from the enormous abuse of it that has taken place. We shall not interrupt our present narrative by describing the system here, but refer to it elsewhere (*CASH CREDIT*). In 1731, the Bank of Scotland tried again to establish branches at Glasgow, Aberdeen, and Dundee, but after a trial of two years was obliged to discontinue them, and the plan was not tried again till 1774.

293. The unlimited power of issuing "promises to pay," placed in the hands of two hostile parties, must naturally have led to great over-issues, before they acquired sufficient experience. To protect themselves from the consequences of these over-issues, as well as from the attacks of each other, the Bank of Scotland in 1730 introduced a clause into their notes, making them payable at the option of the directors of the Bank, at the end of six months, with a sum equal to the legal interest from the time of demand to that time. This practice was adopted by all the other banking companies, for the manifest advantages of banking were so strikingly displayed, that after the expiry of the monopoly of the Bank of Scotland, banking companies started up in all directions, and inundated the country with notes. When the holders of the notes demanded payment for them, the directors of the companies threatened that they would take advantage of the optional clause, unless the demanders would content themselves with a part of what they wanted. Moreover, as there was no restraint upon the amount of their notes, many of the companies issued ones for 10s., 5s., and even lower than that. In Perthshire there were notes for 1s., and even for 1d., and the Perth Banking Company was founded partly to put an end to this nuisance. The inevitable consequence followed; these paper notes drove all the gold and silver out of the country, and the exchange with London fell. Adam Smith says, "While the exchange between London and Carlisle was at par, that between London and Dumfries would sometimes be 4 per cent. against Dumfries, though this town is not thirty miles distant from Carlisle. But at Carlisle bills were paid in gold and silver, whereas at Dumfries they were paid in Scotch bank notes, and the uncertainty of getting those bank notes exchanged for gold and silver coin had thus degraded them 4 per cent. below the value of that coin." And this was at a time when, owing to the degraded state of the English coin, the foreign exchanges were adverse to England, and the market price of gold was £4 per ounce, so that the whole depreciation of the note was about 6½ per cent. Thus we see that at this time, when the Scotch bank notes were at a discount, they were in fact *inconvertible*, or only payable six months

after demand, a circumstance of great importance, and one which must be especially observed, as this was one of the instances alluded to by Sir Robert Peel in introducing his bank Act of 1844.

294. The manifest consequence followed. All the gold left the country, as it always does from excessive paper issues, and the banks were all obliged to employ agents in London, constantly collecting money for them, at an expense of seldom less than one-and-a-half to two per cent. Adam Smith says, "This money was sent down by the waggon, and insured by the carriers at an additional expense of three quarters per cent., or 15s. on the £100. Those agents were not always able to replenish the coffers of their employers so fast as they were emptied. In this case the resource of the banks was draw upon their correspondents in London bills of exchange to the extent of the sum they wanted. When those correspondents afterwards drew upon them for the payment of this sum, together with the interest and commission, some of those banks, from the distress into which their excessive circulation had thrown them, had sometimes no other means of satisfying this draught but by drawing a second set of bills, either upon the same or upon some other correspondents in London, and the same sum, or rather bills for the same sum, would in this manner make more than two or three journeys, the debtor bank always paying the interest and commission upon the whole accumulated sum. Even those Scotch banks which never distinguished themselves by their extreme imprudence were sometimes obliged to employ this ruinous resource.

"The gold coin which was paid out either by the Bank of England or by the Scotch banks, in exchange for that part of their paper which was over and above what could be employed in the circulation of the country, being likewise over and above what could be employed in that circulation, was sometimes sent abroad in the shape of coin, sometimes melted down and sent abroad in the shape of bullion, and sometimes melted down and sold to the Bank of England, at the high price of £4 an ounce. It was the newest, the heaviest, and the best pieces only, which were carefully picked out of the old coin, and either sent abroad or melted down at home, and while they remain in the shape of coin, those heavy pieces were of no more value than the light, but they were of more value abroad, or when melted down into bullion at home." This passage well illustrates the quotation we have given from Aristophanes (*ΑΡΙΣΤΟΦΑΝΗΣ*), and is admirably illustrated by what took place in France during the existence of the Assignats, and in England during the suspension of cash payments.

295. At this period the Scotch banks had got themselves into a very alarming position, from their ignorance of the true principles of regulating a paper currency, as well as of the effect of an excessive issue of paper in depressing the exchanges, and causing an export of gold, and not perceiving that, while in this state, bringing gold into the country was like pouring water into a sieve, or like the toil of the Danaides. They had been far too prodigal in granting cash credits, and allowing them to be converted into dead loans, without observing the rules that were specially applicable to them. And everything seemed

to show that matters would get worse, as the annihilation of the last Jacobite rebellion in 1746 had freed the country for ever from the fear of internal disturbances, and numerous other companies were forming to add to the currency, which was already superabundant.

296. United in a common danger, the two principal banks agreed to combine their influence, and obtain an Act to remedy this, and the Statute 1765, c. 49, was passed, suppressing all notes under 20s., and prohibiting those to be issued with the optional clause, and enacting that all such notes should be payable to the bearer on demand. The banks also curtailed their cash credits very extensively, and called up fresh capital. Owing to these combined measures, silver immediately returned into circulation, the value of the Scotch currency was restored to par, and from that time to the present, although the issues of bank notes were absolutely free until 1845, the Scotch currency HAS NEVER VARIED FROM PAR.

297. The Bank of Scotland and the Royal Bank continued to be the only chartered banks till 1746, when the British Linen Company was incorporated, for the purpose of carrying on the linen manufacture, and banking in connection with it. This company soon found it expedient to discontinue the linen part of their business, and confine themselves to banking, and it has since become one of the most powerful and wealthy of the Scotch banks, but it did not introduce any new feature into Scotch banking.

298. This is the first occasion, that we are aware of, on which that abominable system of accommodation paper, which is the sure precursor of mercantile convulsion, was fully manifested. The Scotch banks seem to have learnt a very wholesome lesson, and contracted their issues more within the bounds of prudence. This was a source of prodigious annoyance to a vast number of speculators and adventurers. The prudence which the banks exercised in discounting, not only alarmed, but enraged these projectors to the highest degree. "Their own distress," says Adam Smith, "of which this prudent and necessary reserve of the banks was no doubt the immediate occasion, they called the distress of the country; and this distress of the country they said was altogether owing to the ignorance, pusillanimity, and bad conduct of the banks, which did not give a sufficiently liberal aid to the spirited undertakings of those who exerted themselves in order to beautify, improve, and enrich the country. It was the duty of the banks, they seemed to think, to lend for so long a time, and to as great an extent, as they might wish to borrow. The banks, however, by refusing in this manner to give more credit to those, to whom they had already given a great deal too much, took the only method by which it was now possible either to save their own credit, or the public credit of the country.

"In the midst of this clamor and distress, a new bank was established in Scotland, for the express purpose of relieving the distress of the country. The design was generous, but the execution was imprudent; and the nature and causes of the distress which it meant to relieve, were not, perhaps, well understood. This bank was more liberal than any had ever been, both in granting

cash accounts, and in discounting bills of exchange. With regard to the latter, it seems to have made scarce any distinction between real and circulating bills, but to have discounted all equally. It was the avowed principle of this bank to advance, upon any reasonable security, the whole capital which was to be employed in those improvements of which the returns are the most slow and distant, such as the improvements of land. To promote such improvements was even said to be the chief of the public spirited purposes for which it was instituted. By its liberality in granting cash accounts, and in discounting bills of exchange, it no doubt issued great quantities of its bank notes. But those bank notes being, the greater part of them, over and above what the circulation of the country could easily absorb and employ, returned upon it, in order to be exchanged for gold and silver, as fast as they were issued. Its coffers were never well filled. The capital, which had been subscribed to this bank at two different subscriptions, amounted to £160,000, of which 80 per cent. only were paid up. This sum ought to have been paid in at several different instalments. A great part of the proprietors, when they paid in their first instalment, opened a cash account with the bank; and the directors, thinking themselves obliged to treat their own proprietors with the same liberality with which they treated all other men, allowed many of them to borrow upon this cash account, what they paid in upon all their subsequent instalments. Such payments, therefore, only put into one coffer what had the moment before been taken out of another. But had the coffers of this bank been filled ever so well, its excessive circulation must have emptied them faster than they could have been replenished by any other expedient, but the ruinous one of drawing upon London, and when the bill became due paying it, together with interest and commission, by another draught upon the same place. Its coffers having been filled so very ill, it is said to have been driven to this resource, within a very few months after it began to do business. The estates of the proprietors of this bank were worth several millions, and by their subscription to the original bond, or contract of the bank, were really pledged for answering all its engagements. By means of the great credit which so great a pledge necessarily gave it, it was, notwithstanding its too liberal conduct, enabled to carry on business for more than two years. When it was obliged to stop, it had in circulation about £200,000 in bank notes. In order to support the circulation of those notes, which were continually returning upon it, as fast as they were issued, it had been constantly in the practice of drawing bills of exchange upon London, of which the number and value were continually increasing, and when it stopped, amounted to upwards of £600,000. This bank therefore had, in little more than the course of two years, advanced to different people upwards of £800,000 at 5 per cent. Upon the £200,000 which it circulated in bank notes, this 5 per cent. might perhaps be considered as clear gain, without any other deduction besides the expense of management. But upon upwards of £600,000, for which it was continually drawing bills of exchange upon London, it was paying in the way of interest and commission, upwards of 8 per cent., and was consequently los-

ing more than 3 per cent. upon more than three-fourths of all its dealings.

"The operations of this bank seem to have produced effects quite opposite to those which were intended by the particular persons who planned and directed it. They seem to have intended to support the spirited undertakings, for as such they considered them, which were at that time carrying on in different parts of the country, and at the same time, by drawing the whole banking business to themselves, to supplant all the other Scotch banks, particularly those established at Edinburgh, whose backwardness in discounting bills of exchange had given some offence. This bank, no doubt, gave some temporary relief to those projectors, and enabled them to carry on their projects for about two years longer than they could otherwise have done. But it thereby only enabled them to get so much deeper into debt, so that when ruin came, it fell so much the heavier both upon them, and upon their creditors. The operations of this bank, therefore, instead of relieving, in reality aggravated, in the long run, the distress, which those projectors had brought both upon themselves and upon their country. It would have been much better for themselves, their creditors, and their country, had the greater part of them been obliged to stop two years sooner than they actually did. The temporary relief, however, which this bank afforded to those projectors proved a real and permanent relief to the other Scotch banks. All the dealers in circulating bills of exchange, which those other banks had become so backward in discounting, had recourse to this new bank, where they were received with open arms. Those other banks were enabled to get very easily out of that fatal circle, from which they could not otherwise have disengaged themselves, without incurring a considerable loss, and perhaps, too, even some degree of discredit.

In the long run, therefore, the operations of this Bank increased the real distress of the country, which it meant to relieve; and effectually relieved from a very great distress those rivals whom it meant to supplant.

"At the first setting out of this bank, it was the opinion of some people that how fast soever its coffers might be emptied, it might easily replenish them, by raising money upon the securities of those to whom it had advanced its paper. Experience, I believe, soon convinced them that this method of raising money was by much too slow to answer their purpose; and that coffers, which were originally so ill filled, and which emptied themselves so very fast, could be replenished by no other expedient, but the ruinous one of drawing bills upon London, and when they became due, paying them by other draughts upon the same place, with accumulated interest and commission. But though they had been able by this method to raise money as fast as they wanted it, yet, instead of making a profit they must have suffered a loss by every such operation; so that, in the long run, they must have ruined themselves as a mercantile company, though perhaps not so soon as by the more expensive practice of drawing and redrawing. They could still have made nothing by the interest of the paper, which being over and above what the circulation of the country could absorb and employ, returned upon them in order to be exchanged for gold and silver, as fast

as they issued it; and for the payment of which, they were themselves continually obliged to borrow money. On the contrary, the whole expense of this borrowing, of employing agents to look out for people, who had money to lend, of negotiating with those people, and of drawing the proper bond or assignment, must have fallen upon them, and have been so much clear loss upon the balance of their accounts. The project of replenishing their coffers in this manner, may be compared to that of a man who had a water pond, from which a stream was continually running out, and into which no stream was continually running, but who proposed to keep it always equally full, by employing a number of people to go continually with buckets to a well, at some miles' distance, in order to bring water to replenish it.

"But though this operation had proved not only practicable, but profitable to the Bank, as a mercantile company, yet the country could have derived no benefit from it; but, on the contrary, must have suffered a very considerable loss by it. This operation could not augment in the smallest degree the quantity of money to be lent. It could only have erected this bank into a sort of general loan office for the whole country. Those who wanted to borrow must have applied to this bank, instead of applying to the private persons who had lent it their money. But a bank which lends money, perhaps, to 500 different people, the greater part of whom its directors can know very little about, is not likely to be more judicious in the choice of its debtors than a private person, who lends out his money among a few people, whom he knows, and in whose sober and frugal conduct he thinks he has good reason to confide. The debtors of such a bank as that whose conduct I have been giving some account of, were likely, the greater part of them, to be chimerical projectors, the drawers and redrawers of circulating bills of exchange, who would employ the money in extravagant undertakings, which, with all the assistance that could be given them, they would probably never be able to complete, and which, if they should be completed, would never repay the expense which they had really cost, would never afford a fund capable of maintaining a quantity of labor equal to that which had been employed about them. The sober and frugal debtors of private persons, on the contrary, would be more likely to employ the money borrowed in sober undertakings, which were proportioned to their capitals, and which, though they might have less of the grand and the marvellous, would have more of the solid and the profitable, which would repay with a large profit whatever had been laid out upon them, and which would thus afford a fund capable of maintaining a much greater quantity of labor than that which had been employed about them. The success of this operation, therefore, without increasing in the smallest degree the capital of the country, would only have transferred a great part of it from prudent and profitable, to imprudent and unprofitable undertakings."

299. This bank, to which this long extract refers, was the celebrated Ayr Bank, which was founded to remedy the alleged distress caused by the niggardly conduct of the existing banks. It was started by a company which comprised

the Duke of Hamilton and many other landed proprietors of immense wealth, and it was based on the fatal delusion that, because the capital and property of its proprietors was undoubted, it might therefore issue notes to any amount without depreciation. This was exactly John Law's theory of money, and this bank is a pregnant instance of its fallacy. The pamphlet we have already quoted from, relating to the Bank of Scotland, had already seen and denounced this fallacy, for it said, with perfect truth and wisdom, *that no matter what the capital of a banking company is, the paper credit in the shape of notes, which it can circulate, bears a certain proportion to the existing specie in the country, and this can only be ascertained by experience.* Now, this strikes at the root of John Law's whole theory, because that is based upon the fallacy that bank notes only *represent* property, and therefore may be multiplied to the extent of any existing property without depreciation—a theory whose results may be seen in the history of the Assignats (ASSIGNATS), whereas the real truth and fact is, that bank notes do not *represent* any property whatever, but are themselves independent entities, and can only maintain their value, like any other independent entities, by bearing a certain proportion to the specie (BANK NOTE). Nor is Adam Smith correct in what he says, that the operations of banking do not increase the capital of the country; there is no more delusive fallacy than this in Political Economy; it is just because banking *does* increase capital so rapidly that it is so dangerous. It is just for the very reason that bank credits, whether in the form of promissory notes, or entries and cheques, perform exactly the same functions, and are in all respects equivalent to the creation of so much additional capital, that they so fatally depreciate the value of the existing specie, if they are multiplied too rapidly. However, this is so fully explained under BANK, BANK NOTE, and DEPOSIT, that we shall not say more about it here. The fatal error of the Ayr Bank, and of Law's theory is this, *not* that capital might be increased by banking, but in not perceiving the *true natural limits to the increase*—in not seeing that the true limits were to be found in its maintaining an equality of value with gold and silver. This unfortunate concern was supposed to have been insolvent within a fortnight after it commenced business. Its mistaken course inflated speculation; the accommodation bill system, which has been the cause of every commercial crisis from that time to this, promoted by this bank and other speculators, formed the exact antetype of the proceedings of the Western Bank, and its herd of adventurers in 1857. The exports in 1771 and 1772 rose to a height they had never done before, and which they did not again equal till 1787. While commerce was in this apparently prosperous, but in reality bloated and diseased condition, the puncture of a pin was sufficient to make it collapse. On the 10th June, 1772, a partner in one of the greatest banking firms in London, Neale & Co., decamped with £300,000, having been deeply engaged in speculating in the funds. This man, named Fordyce, was a Scotchman, and had a large Scotch connection; these were blown upon by the failure of their London agent, and a complete commercial

panic began. The Ayr Bank had branches in Edinburgh and Dumfries, and a run began upon it on the 17th June, 1772, in Edinburgh, and it stopped payment on the 25th, along with a crowd of speculators. The whole of Scotland was shaken to its foundations. There had been no disaster similar to it since the Darien scheme, and there has been none since like it, until the failure of the Western Bank. The credit even of the other banks was almost gone. The person who was the immediate cause of the collapse of the rotten bubble of credit being a Scotchman, the London papers teemed with tirades of abuse of everything Scotch.

300. A writer in one of the papers says that the accommodation bill system first sprung up then. In the *Public Advertiser*, July 8, 1772, it says in a letter, "Banking Companies have appeared in almost every corner of the kingdom, and Bills of Exchange have been multiplied by a new method called *Swivelling*, without any solid transaction." Adam Smith, however, places it earlier; speaking of the refusal of the banks to discount to the extent the speculators wished, he says, "Some of those traders had recourse to an expedient, which for a time served their purpose, though at a much greater expense, yet as effectually as the utmost extension of bank credits could have done. This expedient was no other than the well known shift of drawing and redrawing; the shift to which unfortunate traders have sometimes recourse when they are upon the brink of bankruptcy. *The practice of raising money in this manner had long been known in England*, and during the course of the late war, when the high profits of trade afforded a great temptation to over-trading, is said to have been carried on to a very great extent. From England it was brought to Scotland, where in proportion to the very limited commerce and to the very moderate capital of the country, it was soon carried on to a much greater extent than it ever had been in England. The practice of drawing and redrawing is so well known to all men of business, that it may perhaps be thought unnecessary to give an account of it." And yet a respectable witness, Mr. Latouche, deputed by the private bankers of Dublin to give evidence before the Committee of the House of Commons in 1858, says that the accommodation bill system "arose from a new element, which, when the Act of 1844 was made, did not exist at all, and that was the immense amount of deposits in the hands of Joint Stock Banks paying interest!"

301. We may also notice a fact that was asserted at this time, especially as it has been brought up again in the recent crisis in Scotland. It was generally, if not universally supposed in Scotland that three of the chartered banks, the Bank of Scotland, the Royal Bank, and the British Linen Company, were banks with limited liability. It is even positively stated so in the Reports of both Houses of Parliament, in 1826. Recently, however, this has been called in question with regard to the two latter banks. Mr. Hodgson, a Director of the Bank of England, in giving evidence before the late Committee, says, Q. 3575, "The only bank existing in Scotland with limited liability is, I believe, the Bank of Scotland; there is, I believe, a very great doubt about the Royal Bank of Scotland, and the British

Linen Company, having a limited liability; I believe that the Bank of Scotland has a perfect charter, as perfect as that of the Bank of England; I believe that though the other two banks, which I have named, have charters conferring certain privileges, it is very much doubted whether in those privileges limited liability is included. *Mr. Cayley*—Is there not a general impression in Scotland that they are banks of limited liability?—There has been that impression not only in Scotland, but in England, and amongst their own customers; but of late that opinion has been very much shaken, and I believe that the opinion of the Lords of Session now is, that those banks have not limited liability." However, there is in the *Public Advertiser* of the 22nd June, 1772, a letter from an apparently well informed person, stating that the proprietors of the Bank of Scotland are fully liable for all its debts, and that their property is worth several millions, and urging that as a strong reason why the Bank of England should come forward to their assistance. Now, if this be so, it will certainly be a great surprise to common opinion. May it be long before the question in respect to either Bank has any practical importance.

302. In 1774, by the Statute of that year, c. 32, the Bank of Scotland was authorized to double its capital stock, and the limit which any shareholder might hold was raised to forty shares. In this year the Bank began successfully to establish branches, which has since become so marked a feature in Scotch banking. In 1784, by the Statute of that year, c. 12, the capital of the Bank was raised to £300,000, and all restrictions as to the amount of stock any proprietor might hold, taken off. In 1792, by the Statute of that year, c. 25, the capital was raised to £600,000, and by Statute, 1794, c. 19, to £1,000,000, and by Statute, 1804, c. 23, to £1,500,000, of which £1,000,000 has been called up, and at which it still remains.

303. The next great commercial crisis was in 1793. This also extended to Scotland. This was attributed by the best contemporary writers to the inordinate multiplication of the country bankers, and the commencement of the revolutionary war. Three-fourths of the country bankers in England were greatly shaken. The Bank of England refused all assistance, in spite of all solicitations made to it, for which it is severely blamed by Sir Francis Baring (*BARING, SIR FRANCIS*), and the Bullion Report (*BULLION REPORT*). When the Bank adopted this perverse course, universal failure seemed imminent. Sir John Sinclair remembered the precedent of 1697, when Montague had sustained public credit by an issue of Exchequer Bills, and thought that a similar plan might be followed in this crisis. Mr. Pitt desired him to propose a scheme for the purpose, which he presented on the 16th April. A committee of the House of Commons was immediately appointed. In the meantime a director of the Royal Bank of Scotland came up, with the most alarming news from Scotland. The public banks were wholly unable, with due regard to their own safety, to furnish the accommodation necessary to support commercial houses, and the country bankers. That unless they received immediate assistance from government, general failure would ensue. Numerous houses, who

were perfectly solvent, must fall, unless they could obtain temporary relief. Mr. Macdowall, M.P., for Glasgow, stated that the commercial houses and manufactories there, were in the greatest distress, from the total destruction of credit. That the distress arose from the refusal of the Glasgow, Paisley, and Greenock banks to discount, as their notes were poured in upon them for gold. This panic was allayed by the Government consenting to issue small exchequer bills, and by the activity of Sir John Sinclair, in getting money sent down to Glasgow, in anticipation of these exchequer bills. (*CRISIS, COMMERCIAL.*)

304. In 1797, when the Bank Restriction Act was passed, all banking companies and bankers in Scotland, were allowed to issue notes payable to bearer on demand, for any sum under 20s.; but though the Bank of Ireland was ordered to suspend cash payments, the Scotch banks were never allowed, or compelled to do so, and the Scotch banks continued during the whole revolutionary war liable to pay cash on demand.

305. The next occurrence that we may mention, as it was regarded as a political event, was the foundation of the Commercial Bank in 1810. This was at the time when the high Tory régime was in its highest and palmiest state, and the banks were alleged to carry their politics into their business. The Liberal party then determined to found an opposition bank, which was named the Commercial, which has attained as great an eminence as any of the older ones in public estimation. Its capital, as yet paid up, is £600,000, which, its directors very recently gave the satisfactory assurance to its shareholders, is perfectly intact, and in addition to that, it has £400,000 of accumulated profits as a reserve fund. This bank subsequently obtained a charter, but the liability of its shareholders is specially declared unlimited.

306. In 1818, it being found that many foreigners availed themselves of the privilege of naturalization by purchasing stock in the Bank of Scotland, this clause in their original Act was repealed.

307. The long and dreadful catalogue of banking failures in England, chiefly owing to the monopoly of the Bank of England, and which were attributed to the issues of the £1 notes of the country bankers, made the ministry of 1826 desirous to abolish them in Scotland and Ireland, at the same time as they did those of England. But this raised such a ferment in the country, that the government consented that committees of both Houses should be appointed to inquire into the matter. The result was so eminently favorable to the Scotch banking system, that no further interference was attempted. "With respect to Scotland," says the report of the Lords, "it is to be remarked that during the period from 1766 to 1797, when no small notes were by law issuable in England, the portion of the currency of Scotland in which payments under £5 were made, continued to consist almost entirely of notes of £1 and £1 1s., and that no inconvenience is known to have resulted from this difference in the currency of the two countries. This circumstance, among others, tends to prove that uniformity, however desirable, is not indispensably necessary. It is also proved by the evidence, and by the documents, that the banks of Scotland,

whether chartered or joint stock companies, or private establishments, have for more than a century exhibited a stability which the committee believe to be unexampled in the history of banking; that they supported themselves from 1797 to 1812, without any protection from the restriction by which the Bank of England, and that of Ireland, were relieved from cash payments; that there was little demand for gold during the late embarrassments in the circulation; and that in the whole period of their establishment, there are not more than two or three instances of bankruptcy. As during the whole of this period a large portion of their issues consisted almost entirely of notes not exceeding £1, or £1 1s., there is the strongest reason for concluding that, as far as respects the banks of Scotland, the issue of paper of that description has been found compatible with the highest degree of solidity; and that there is not, therefore, while they are conducted upon their present system, sufficient ground for proposing any alteration, with the view of adding to a solidity which has so long been sufficiently established." The report of the Commons was also adverse to any legislative interference with Scotch banking.

308. No interference with Scotch banking took place till 1845, when Sir Robert Peel having carried his Bank of England Charter Act, and Joint Stock Banking Act, with scarcely a breath of opposition, determined to regulate those of Scotland and Ireland, as well. The principal provisions of this Act, Statute 1845, c. 38, are as follows:—

I. All persons had been prohibited by the Statute 1844, c. 32, from commencing to issue notes after the 6th May, 1844, in the United Kingdom, and all such persons in Scotland as were lawfully issuing their notes between the 6th May, 1844, and the 1st May, 1845, were to certify to the Commissioners of Stamps and Taxes, the name of the firm, and the places where they issued such notes.

II. The commissioners were to ascertain the average number of such bankers' notes in circulation during the year preceding the 1st May, 1845.

III. Such bankers were authorized to have in circulation an amount of notes, whose average for four weeks was not to exceed the amount thus certified by the commissioners, together with an amount equal to the average amount of coin held by the banker during the same four weeks. Of the coin three-fourths must be gold, and one-fourth silver.

IV. In case the bank exceeds the legal amount, it is to forfeit the excess.

V. If two or more banks unite, they are authorized to have an issue of paper to the aggregate amount of issues of the separate banks, as well as the amount of the coin held by the united bank.

VI. Notes of the Bank of England not to be legal tender in Scotland.

309. The reader will see that there are some striking points of difference between the restraints laid upon the English and Scotch banks, for while the former are bound down to an absolute fixed limit of issue, the latter are permitted to issue to any amount, provided they hold an equal amount of coin above their authorized amount. Moreover, if any number of banks unite, they may

have an aggregate authorized issue, equal to that of the separate banks; but in England, if the number of partners of the united bank exceeds six, they forfeit their power of issuing notes altogether. This absurd restriction as to the number of partners in a bank never having had any force in Scotland.

310. The year 1857 was remarkable for a calamity, to which there had been no precedent except the Ayr bank, namely, the suspension of two very large joint stock banks, the Western Bank and the City of Glasgow Bank. The latter, indeed, has resumed business, and on an investigation of its affairs, it appeared that, out of a capital of above £800,000, it had lost about £70,000; having thus a very large paid up capital intact, it resumed business, and we may hope that after having received this severe lesson, its business will be conducted on better principles in future. But the Western Bank was found to have lost not only the whole of its paid up capital, £1,500,000, but nearly as much more besides. This bank was founded in 1832, so that in the course of twenty-four years, it lost £3,000,000 of money. The Ayr bank, in two years and a half, lost £400,000, so that of the two, the latter is proportionably the more severe calamity. The failure of the Western Bank, however, has called forth the most bitter attacks upon the general system of Scotch banking, which we shall find to be totally unmerited, because it is clearly proved in the evidence taken before the Committee of the House of Commons in 1858, *that during the whole course of its career, it pursued a system which was diametrically opposed to the usual course of the other Scotch banks.*

311. The Western Bank began business in 1832, and in the next year had a paid up capital of £209,170, which was increased year by year, till, in 1849, it amounted to £1,792,850, at which it continued till 1852, when a number of shares having fallen into the bank's hands by bankruptcy and insolvency, they were written off against the capital, which was thus reduced to £1,500,000, at which it continued till the closing of the bank. The mode of business adopted by this bank from the beginning, was not according to the usual plan of Scotch banking, for while as explained by the witnesses before the committee of 1858, one very important feature of it is to keep very large reserves in London, either at their bankers', or in government securities; the Western Bank invested its means chiefly in local accommodation, and kept very insufficient reserves in London, so much so, that, in 1834, its London agents, Messrs. Loyd & Co., dishonoured its drafts. It appears that upon this, the other Scotch banks refused its notes, and remonstrated with it for its mismanagement. On the 30th October, 1833, the directors, in answer to these remonstrances, notified to the other banks that they had resolved to invest, in marketable securities, a sum amply sufficient to prevent such a thing happening again. They promised to commence the necessary operations in the following January, and complete them in April, if not earlier. They also engaged to lessen their discounts, and to continue to do so, in order to have sufficient funds at its command. Upon this promise of better conduct in future, the three chartered banks advanced the Western Bank £100,000 to enable them to pur-

chase these securities forthwith. But the Western directors very soon broke their engagement, and reverted to their former mode of business. In 1838, they applied to the Board of Trade for a grant of letters patent, when a number of the other Scotch banks presented a joint memorial against it. They said that they should be wanting in their duty to the public, as well as their own constituents, if they sanctioned by their silence such an application. "The fact is well known to you, that while there have occurred, during the past fifty years, periodical convulsions among the banks in England, which have led to the failure of several hundreds, Scotland has, for the most part, maintained a state of general tranquillity, and there have, in the same time, occurred only three or four failures, and those of a very minor character. The cause of this is notoriously owing, first, to the large capital employed in the Scotch banks, and second, to the system of administration adopted. Capital alone, as has been recently experienced in England, by extending the scale of operations, may only increase the mischief. In the like manner, a numerous proprietary, constituting a protection to the public against eventual loss, may, by adding to the credit, add to the power of such an institution for evil. The safeguard of the Scotch system has been the uniform practice adopted of retaining a large portion of the capital and deposits invested in Government securities, capable of being converted into money, at all times, and under all circumstances. This requires a sacrifice, because the rate of interest is small, and in times of difficulty the sale involves a loss, but it has given the Scotch banks absolute security, and enabled them to pass unharmed through periods of great discredit.

"It is not then unreasonable that the managers of the Scotch banks should look with favour on a system which, notwithstanding their close connection with England, has exempted them from these calamities, and in the doubt that exists on banking theories elsewhere, it is at this moment sufficient to say that the system established in Scotland has worked well, and ought not to be disturbed there.

"The Western Bank was established in the year 1832, and the principle on which it has avowedly acted has been to employ as much as possible of its capital and assets in discounts and loans, retaining only the cash necessary to meet its current engagements.

"As this is a more profitable investment than Government securities, there is always a strong temptation to speculative or inexperienced persons to adopt this course, and if the consequences were to affect themselves alone, it would be of small moment, but, unfortunately, in banking, this cannot be. The whole system depends upon credit, and the failure of an ill-regulated establishment affects those differently constituted. Such a body in prosperous times boldly extends its business, and from seeing the readiness with which in such seasons commercial paper is discounted, comes to the conclusion that it is the best and most convertible description of investment that could be found.

"Prudent banks, knowing the delusive nature of this expectation, are compelled to increase their own reserve to meet the consequences of this

unwise expansion; and when the difficulty comes, they must either assist their rival to prevent an explosion, or must make a heavy sacrifice by selling their securities at a loss.

"The Western Bank, acting on this principle, allowed their London transactions to assume such an irregular shape, that their London agents, the respectable house of Jones, Loyd, and Co. took alarm, and in 1834 dishonored their drafts. The Bank of Scotland, Royal Bank, and British Linen Company were compelled to come to their assistance, and made then considerable advances. These circumstances, occurring in a time when the money market was perfectly tranquil, shewed the extreme danger of the practice. The Edinburgh banks insisted on a better system of management being adopted, and that the Western Bank should have invested in Government securities a sum amply sufficient to meet emergencies. The directors, after much discussion, at length, by a resolution dated 30th October, 1834, distinctly assented to the requisition, but as they had so engaged the assets of the Bank, as to render it impossible immediately to procure the funds, the Edinburgh banks lent them £100,000 for the purpose. *For some time the Western Bank may have acted on this agreement, but the temptation of profit appears to have got the better of their prudence, and they now repudiate their engagement.*

"It will be quite apparent that a bank that can employ its whole funds in this manner, is enabled either to divide a larger share of profits than its competitors, or to do business on more favourable terms; and we repeat, that if the only consequence of this was to increase or diminish the dividends of the rival establishments, it would be of comparatively small importance, but in its result it endangers the existence of every bank in the country, and the fortunes of a large portion of the community. We feel that, if letters patent shall be granted to this bank, after what has passed, *it will be a public sanction and countenance of a new and mischievous principle, opposed to the Banking system of Scotland.*

"The question is not in this instance, whether Government will interpose new restraints on banking companies, but whether they will encourage a violation of the old system, by granting distinction and privileges to a company, which having pledged itself to their observance now disowns them in its practice, and under these circumstances applies for a charter." This memorial was signed by the Bank of Scotland, the British Linen Company, the Commercial, and National Banks; and the Charter, if applied for, never was granted.

312. This system of keeping such small reserves in London produced the consequence foreseen in the preceding memorial. In 1847 the Western Bank was in difficulties, and received assistance from the Bank of England to the amount of £300,000 in November and December, 1847, which it repaid in March, 1848. From this time forward till 1852, when a change in the management took place, a rather more cautious course was pursued, but they did what we believe to be totally contrary to the usual practice of the other Scotch banks, they rediscounted. The following figures shew the amount of discounts and rediscounts from 1847 to 1852:—

	Discounts.	Rediscnts.
	£	£
In 1847 . . .	15,711,488	656,077
" 1848 . . .	12,088,648	874,707
" 1849 . . .	10,522,022	249,957
" 1850 . . .	12,048,669	290,818
" 1851 . . .	13,322,758	588,247
" 1852 . . .	13,525,882	407,148

At this time the Bank had £356,000 of overdue bills, besides other very heavy locks-up of capital, in one case amounting to £120,000, which was covered by insurances on the lives of the obligants, on which it had paid £33,512 as premiums when it stopped. "But even at this time," says Mr. Fleming, "it had a cluster of those people who had manufactured accommodation bills, doing business with them." So that in this year he says the Bank was not in a satisfactory state.

313. In 1852 a new management commenced, and to shew how the practice of rediscounting increased we give the following figures:—

	Discounted.	Rediscounted.
	£	£
In 1853 . . .	14,987,740	1,682,820
" 1854 . . .	18,596,704	3,856,292
" 1855 . . .	19,835,781	4,969,669
" 1856 . . .	20,410,884	5,407,868
" 1857 till Nov. 9	20,691,415	4,881,221

Thus we see the enormous increase of this most perilous practice during these years, a practice which places the existence of any institution that depends upon it to any great extent, at any moment at the mercy of the will, the caprice, or any accident that may happen to the purchasers of its bills.

314. But this was by no means the only instance of reckless management. Over and above all the other embarrassments, there were four accounts particularly to which the subsequent calamity was due; we will shew the state of these accounts in 1852 and 1857—

	Discounts.	Overdrawn Account.
	£	£
1852.		
Macdonald & Co. .	107,116	
Menteith & Co. .	83,779	3,528
Wallace & Co. . .	18,144	
Pattison & Co. . .	89,678	1,154
	<u>£188,717</u>	<u>£4,677</u>

Shewing that these four firms were under obligations to the Bank in 1852 to the amount of £193,394. The following was the state of the same accounts in 1857:—

	Discounts.	Overdrawn Account.	Overdue Bills.
	£	£	£
Macdonald . . .	408,716	5,633	8,526
Menteith . . .	876,799	67,685	98,129
Wallace . . .	227,464		
Pattison . . .	886,996	67,258	11,571
	<u>£1,849,975</u>	<u>£135,524</u>	<u>£118,226</u>

Being a sum total of £1,603,725 to these four houses alone, when they failed. And to show the character of the bills discounted for these firms, of £402,716 bills of Macdonald's current at the time of their failure, £398,349 were dishonoured at maturity; of Menteith's, £376,699, current at their failure, £269,726 were dishonoured at maturity; of Wallace's, of £226,741 current, there

were dishonoured £209,534; and of Pattison's, of £336,996 current, there were dishonoured £150,749.

315. Soon after the general meeting of June, 1857, the directors requested another person to examine the Bank's books, who, after doing so, and allowing all the current business of the bank to be good, including the above four firms, found that, bad debts to the amount of £573,000 were kept on the books as good, which, after deducting the rest and guarantee fund, amounting to £246,000, made a loss of £327,000 in the capital of the bank, and the advances to shareholders, holding 7,626 shares in the bank, amounted to £988,487. In the month of September, 1857, Mr. Fleming, the person whom the directors had requested to assume the temporary management of the Bank, began seriously to inquire into the nature of these immense accounts, and on the 7th, the Wallaces acknowledged that they were dealing in accommodation bills, and he saw that the Macdonalds must be doing the same thing, as the two houses were drawing on the same names. It was found that the Macdonalds drew upon 124 acceptors, only 37 of whom had been inquired about, and of these, reports on 21 were extremely bad. But there were 60 or 70 persons whom they drew upon, who made it a regular trade to accept bills for a small commission; in fact, it appeared that they engaged a man in London to procure them accommodation acceptances. As soon as the true nature of these accounts was ascertained, there was no resource but to stop them. The failures of Monteith and Macdonald, which were the first that became notorious, created a panic on the Stock Exchange on the 10th October, and the price of the stock rapidly fell, it being commonly reported that the whole capital of the bank had been engaged in enabling these parties to carry on their business for a series of years. These rumours created a run on the bank, to a slight extent, on the following Tuesday, which continued for two or three days, and during that week, ending the 17th October, the bank paid away about £36,000 in coin, but this was the only run for gold of any amount on the bank, for during the following week it only paid away £4,000, and in the week after that about £2,000, and the whole paid away in coin, between the 10th October and the 7th November, the Saturday before it stopped, was only £44,000. But during this period, the total deposits demanded were £1,280,000, and except the sum above mentioned as paid in coin, *the whole of these deposits were paid in the bank's own notes, which were immediately taken and lodged in the other banks.*

316. This dreadful catastrophe deserves to be minutely detailed, because it is strenuously asserted by a very influential party, that the small note circulation of Scotland tends to increase a panic among its holders. But in this case, the bank's notes in circulation did not in any way increase the panic. Mr. Fleming says, "I may say that there was no run for the payment of notes, all through. There may have been a few notes presented, but I should certainly limit the demand for gold in exchange for notes, to £5,000 or £6,000, I do not think it would exceed that. Mr. Wilson—In point of fact the whole pressure

upon the bank at any time was in respect to its deposits, and not in respect to its circulation? "*Decidedly, there was no pressure in respect to its circulation*; so much so, that during the last two days for which the bank was in operation, I do not think £1,000 was paid away in gold, at the head office. The whole money withdrawn was taken away in notes, and the consequence was that on the afternoon of the 9th of November, when the bank stopped, there was a very large amount of notes in circulation, something about £720,000. —Then the depositors became uneasy about the security of their deposits, went to the bank, and took the bank's notes?—Yes. Did they pay them immediately into other banks?—Yes. * * * Was there much drain in the provinces upon the balances?—Not a very large amount, certainly; a wonderfully small amount, in proportion to the total deposits, was withdrawn from the country.—I think you said that at the branches there was very little demand for gold, almost none?—*Almost none.*"

317. At the same time a very heavy blow fell upon them from another quarter. The bank, instead of keeping its funds well in hand in London, engaged in exchange operations with America. They had an agent in New York, though perhaps not openly and avowedly in that character, who granted letters of credit upon them, in favor of persons who wished to raise money. Such parties arranging with the agent, the securities to be lodged to meet the bank's acceptances. These credits were not by any means always paid at maturity, but were renewed to a large extent. By this operation a very considerable portion of the bank's funds was locked up in America, instead of being in London as they ought to have been. At the time of its suspension, its acceptances current, and its obligations to accept, amounted to £317,000, in two months' bills, which, multiplied by six, gives the amount of the year's transactions. The amount of funds locked up in America by their agent there appears to have been £376,520, against which he held railway bonds and current bills. Mr. Fleming said, Q. 5510—"It appears to me in many cases, the credits established by Lee upon the Western Bank have been modes of raising money for the purpose of constructing American railways, and for speculation in stocks, in New York." "The two banks, i.e. the Western and the City of Glasgow," said Mr. Robertson, the cashier of the Royal Bank, "were in the habit of accepting four months' inland bills drawn from London, Liverpool, and Glasgow, in respect of these credits, which was quite condemned by the Bank of England, and all the other banks in Scotland."

318. The general stoppage and failure of American credit at this time, rendered the expectations of any remittances hopeless from there. And Mr. Fleming, who undertook the duty of manager on the 15th October, told the directors it was absolutely essential to make provision for a contingent drain upon the deposit money, and also for the American acceptances becoming due. On the 17th October, the directors resolved to apply to the Bank of Scotland. On the 21st a written application was made to that bank for assistance, and on the 23rd a meeting having been held of all the Edinburgh banks, they declined to assist, until application had been made to the Bank of Eng-

land. This application was made on the 26th, and refused. This refusal being telegraphed down to Edinburgh, a meeting of the banks was held the same evening, and they agreed to advance £500,000, on condition that the directors should dissolve and wind up the concern. After some days' negotiation, the Edinburgh banks agreed to forego the compulsory winding up, as the directors of the Western said they had no power to do so, and advanced the money without this condition. This sum was accordingly advanced on the 29th October, on the promissory notes of the Western Bank, at six months' date, for £510,000, the terms being that the Western Bank should be bound to replace the Edinburgh banks in Consols, at the price of the day. In addition to the loan so obtained from the Edinburgh banks, the Clydesdale Bank advanced £100,000 on a note of the bank's at six months, with the individual guarantee of the directors, which was discounted at the current rate of 8 per cent.

319. The withdrawal of the deposits from the Bank, which was almost entirely among the small depositors, had greatly abated, and whatever might have been the ultimate result, which might have been necessitated in consequence of the examination of the Bank's affairs that was then in progress, there was no immediate danger of a catastrophe; when on the 29th October the city article of the *Times* announced that the Edinburgh banks had resolved to carry the Western Bank through their difficulties, on condition that they should wind up. The *Times* reached Scotland on the morning of the 30th, and immediately a fresh pressure commenced on the Bank. But this time it was of a different character from the previous one. The first pressure had been among the small depositors, the second consisted of the traders, who kept large accounts, who seeing that the Western Bank was going to close, made haste to transfer their balances to the other banks and open accounts with them, and it was this pressure which continued and made the Bank close its doors on the 9th of November, *not from a demand for gold, but because the balances of these accounts being withdrawn in the bank's notes, and paid into other banks, the Western Bank was unable to provide for the purchase of Exchequer bills from the other banks, to rectify this balance by a draft on London.*

320. To shew how mischievous this publication of the terms proposed was, we quote from Mr. Fleming's letter to the Bank of Scotland of 31st October, 1857. "The application made a fortnight ago, by the Directors of this Bank to the other Scotch banks, for a credit to the extent of £500,000, was based on my calculation that £350,000 or £400,000 would keep our London finance in perfect order, and that the remainder would be a sufficient reserve to meet any probable withdrawal of deposits. This calculation I still believe would have proved correct, *had the assistance required been given promptly, quietly, and free from any condition as to winding up.*

"But the demands made upon us have considerably exceeded my calculation, from two causes; first, the notoriety of our financial embarrassment, created by the delay in acceding to our application, and the course which the negotiations took from our having been referred to the Bank of England; and, second, the condition as to

winding up, which the other banks sought to impose, and the publicity given by the *Times* to this condition.

"It is not easy to say in figures to what extent these causes have respectively operated in inducing withdrawals, or to estimate to what extent they may still operate. But as to the past, my own observation here, and the reports from our branch agents, all convince me that the second has been immeasurably more mischievous than the first. *Deposits on receipts have been withdrawn to a very limited extent indeed, but balances on current accounts kept by the trading community have been removed to other banks to a considerable extent.* The reason is natural and obvious. If this Bank is to wind up, traders know that we cannot give them accommodation, and they take the earliest opportunity of arranging for that accommodation elsewhere, and withdraw their balances.

"I am hopeful that the mischief already done is not irreparable. That we retain still a measure of public confidence, is proved by the fact that *no fixed deposits of any large amount have been withdrawn, and nothing like a run has taken place, and gold has scarcely ever been demanded.* * * *

"I have already said that there has been no demand made upon us for gold, *all sums withdrawn having been taken in our own notes, and consequently the other banks have got the deposits.*"

The Western Bank then asked a further loan from the Edinburgh banks, which having been discussed for some days, was unanimously refused.

321. On Saturday, the 7th November, there was, from the heavy withdrawals of deposits in the Bank's notes, and their lodgment with the other banks, a heavy adverse balance on the exchange of that day. The Edinburgh banks were immediately informed that the Western Bank was unable to provide for this adverse balance on the following Monday. On the Sunday they resolved as soon as this inability to pay the balance should be declared, to instruct their agents to refuse the Western's notes. *And it was beyond all question shewn that it was this injudicious line of conduct that chiefly brought on the subsequent run for gold.*

322. The exchange being heavily against the Western on Saturday, it made a final proposal to the Edinburgh banks, and sent a scheme of an amalgamation with the Clydesdale Bank, to be discussed by them on Monday morning, the 9th, and kept its doors open till 2 o'clock, to learn their final decision. This being a decided refusal to entertain the terms proposed, the Western Bank shut its doors at 2 p.m., on Monday the 9th November. Another bank, the City of Glasgow, it was also known, had been engaged in transactions of the same nature as the Western, in America, and had also been equally negligent in keeping due reserves in London. This bank, too, required the assistance of the Edinburgh banks, though it has not been stated how much they received. On the evening of the 9th a run commenced on the saving's bank branches of this bank. "On the Tuesday morning," says *Mr. J. Robertson*, the manager of the Union Bank, "when the doors of the banks were opened, a great number of parties appeared with deposit receipts demanding gold; in fact the office of our own establishment was quite filled with parties

within a quarter of an hour of the opening of the doors; I think at half-past 9. The *Chairman*: You are now speaking of the Union Bank?—I am speaking of most of the banks; I speak of the Union Bank particularly. Were the Western Bank's notes at that time current, or were they refused?—*They were not current unfortunately.* Was there any deputation from Glasgow to Edinburgh on the subject of the other banks agreeing to take the Western Bank's notes?—This run, as you may call it, or panic, increased so much, that *the continued refusal of the notes of the Western Bank added very much to the excitement.* Those people who came for money would not take the notes of any bank, it did not matter what bank it was; they refused everything but gold. We thought that it would allay the excitement, if we were to take the Western Bank's notes; there being no danger of ultimate payment. We were so much impressed with that feeling, that two of the banks sent a deputation of their directors to Edinburgh to confer with the managers of the Edinburgh banks on the subject, and to induce them to rescind their order. They failed in that; the notes of the Western Bank were refused the whole day on the Tuesday."

323. The run of Tuesday exhausted the City of Glasgow Bank, and it did not open on the Wednesday the 11th. The state of Glasgow was so alarming that the magistrates sent for troops, and did all in their power to allay the excitement; they issued a proclamation advising the people not to press the banks for payment, and to take the notes of all the banks. They issued an order to all the rate collectors in the city to take all notes presented to them, including those of the two suspended banks. *But the demand for gold was almost entirely confined to the depositors, very few noteholders came forward.* On Wednesday and Thursday large remittances of gold from London arrived, about 10 o'clock in the morning, and were taken in waggons to the banks, escorted by strong bodies of police. But the run entirely ceased about 2 o'clock on Wednesday: at half-past two, says the same witness, there were not half-a-dozen people in the establishment. The panic, as this witness said, only lasted one whole day and part of the next.

324. In fact, the refusal to take the Western Bank's notes was one of the chief causes of the run for gold, and as soon as the other banks agreed to take them the panic ceased. *Mr. Lawrence Robertson* was asked, "What was it which first caused the panic to cease?—When the stoppage of these banks took place, the other banks were not precisely informed of their position, and hesitated a little in taking their notes; after further consideration, the other banks resolved to take all the notes as they came forward, and when that was done the thing subsided. As soon as it became known that the notes of the Western Bank would be received by the general body of banks in Scotland, the panic, with regard to the notes of the Western Bank, came to an end?—*Entirely.*"

The same witness also said, that there was no run upon any of the Glasgow banks before the stoppage of the Western Bank. "Were those parties who drew out gold over the counter in exchange for notes, or by cheques on their deposits?—It was chiefly in the case of small de-

posit receipts. And not for any considerable amount?—No. Do you think that it exceeded £1,000?—It is difficult to fix upon a sum; I never looked at that.—It was not of sufficient importance to call your attention to it?—No.” The City of Glasgow Bank resumed payment in about a month, but the Western Bank had lost not only its whole paid up capital of £1,500,000, but as much more again.

325. The details of this great catastrophe well deserve our closest attention, because it is the first instance of a *banking* panic in Scotland, and even that was confined to one town. The commercial failures were confined exclusively to the herd of adventurers who had been fostered and supported by the mismanagement of the Western Bank. There was but one house of any magnitude connected with Glasgow which suspended payment during this period, Dennistoun & Co., who were more a Liverpool and London house than a Glasgow one, and whose temporary stoppage was brought about by other causes. But this calamity has been seized hold of by persons who are hostile to the Scotch system of banking in general, and also to the £1 note currency of Scotland, to condemn them. But when we come to investigate the true facts we shall find that they lend no support to these charges. For with respect to the first, it is distinctly proved by the most unanswerable evidence, that from the commencement to the close of its career, the Western Bank pursued a system of business that was totally opposed to the well recognized system of Scotch banking, and unanimously condemned by all the well conducted banks. That during its whole course, it was a subject of terror and alarm to the other banks. That its locking up its funds in America was totally condemned by the Bank of England, and all the other Scotch banks. And the directors themselves, when, however, it was too late, acknowledged their own misconduct, for in their first application for assistance to the Bank of Scotland, on the 21st October, 1857, the Directors say, “On the part of the board of direction, it is right that *we should frankly say, that they are fully alive to the recklessness of the past management of the Bank*; that its credit has been strained to the extreme point; and that in the attempt to make large profits for the proprietary, unwise and undue risks have been run. Feeling all this, the Directors have entered on a course of management, which, (although the present commercial crisis renders curtailment difficult of speedy accomplishment) will eventuate in the establishment on a secure basis, of a business of a safer and a more legitimate, though certainly of a more limited description, than has for many years been conducted by the Western Bank of Scotland.” *Habemus ipsos confitentes reos.* The directors themselves acknowledged that their course of business was not in accordance with the usual Scotch banking system; what possible reflection then can it be on the recognized system that a bank, which went right in the teeth of it, failed? The very same remarks apply, only of course in a lesser degree, to the City of Glasgow Bank. This bank, too, was guilty of speculating in America, instead of keeping its reserves in London. And it, too, paid the penalty, by a temporary suspension.

326. The second charge, too, is equally

groundless, against the small note circulation. For it is said that these small notes aggravate a panic, and that a panic is most likely to commence amongst their holders. But in this case, the evidence most decisively negatives the supposition that any part of the panic was due to the small notes, and not only that, *but it decisively proves that the demand for gold was greatly lessened on account of the notes.* Mr. Fleming says, Q. 5532, “I may say there was no run for payments of notes all through. There may have been a few notes presented, but I should certainly limit the demand for gold in exchange for notes to £5,000 or £6,000, I do not think it would exceed that. Mr. Wilson—In point of fact, the whole pressure on the Bank at any time was in respect to its deposits, and not in respect to its circulation? Decidedly; *there was no pressure in respect to its circulation*; so much so, that during the last two days for which the Bank was in operation, I do not think £1000 was paid away in gold at the head office. The whole money withdrawn was taken away in notes, and the consequence was that on the afternoon of the 9th November, when the Bank stopped, there was a very large amount of notes in circulation, something about £720,000. Mr. Wilson—Then the depositors became uneasy about the security of their deposits, went to the Bank and took the Bank’s notes? Yes. Mr. Wilson—Did they pay them immediately into other banks?—Yes. Mr. Wilson—They thereby indirectly obtained payment through the other banks? Precisely so; they transferred their deposits from one bank to the other. Mr. Wilson—Did many of the depositors demand gold? Almost none; during the week after the 10th October, there was a slight demand for gold, and in the country, I believe, there was a very slight demand for gold.” Mr. Fleming then gave the figures, shewing that the total demand for gold during the whole month from the 10th October to the 9th November, was only £44,000, of which not more than £6,000 was in exchange for notes, but the total demand for deposits and balances on account was £1,280,000; from which it follows, of course, that the total pressure on the Bank was this:—

For gold in exchange for notes . . .	£6,000
For deposits taken in gold . . .	88,000
For deposits and balances taken in Bank’s notes	1,286,000
	<hr/> £1,280,000 <hr/>

Now, if the Bank had not issued notes, how would this last item have been demanded? *Of course in gold.* So that it is quite clear that the power of the Bank to issue notes saved and lessened the demand for gold to that extent. And we have already shewn that it was not any run for gold which made the Bank stop, but its inability to provide for payment of the adverse balance of exchange. But it may be said, See what followed the next morning. There was undoubtedly a run for gold next morning on some of the other banks. *But then there would have been the very same run if there had been no notes at all.* And that very run was greatly aggravated, if, indeed, it was not chiefly due to the most unfortunate decision of the other banks to refuse the Western Bank’s notes. *As soon as the other*

banks agreed to take the Western's notes, the panic immediately subsided, even though a second bank stopped the same morning. Now, what is the effect we might naturally have expected from a second bank's stopping in the midst of a panic? Clearly that that panic would have been greatly intensified. But in this case it was not so. The City Bank did not open on the Wednesday morning, and yet the whole panic was over by two o'clock that day. The whole demand on the Royal Bank for gold did not exceed £1,000.

327. Now, without prejudging the question in any way, whether the Scotch £1 notes should be suppressed, there is no dispassionate man who can, after reading the details of this crisis, come to the conclusion that they had anything whatever to do with this panic. The great wonder is, that after the unprecedented circumstance of two great banks stopping payment, the panic was so short, and so slight as it was. Does any man who knows London think that, if a similar case had happened there, the consequences would have been so comparatively trifling? The two London banks of most nearly equal magnitude with the Glasgow ones that stopped, are the Union and the London and County. Let us imagine that the Union Bank of London was to stop payment, and two days after the London and County. Does any man who knows London suppose that in such a case the panic would be limited to one day and a half? No man in his senses would think so.

328. Nor can there, we think, be any reasonable doubt that the refusal of the Edinburgh banks to take the notes of the Western Bank was a most unfortunate one. When the Ayr Bank failed, all the other banks immediately gave notice that they would take its notes at par, because they knew very well that its proprietors were perfectly well able to discharge all the claims upon them. It was perfectly well known that the proprietors of the Western Bank were worth many millions of money, and that there was no possible danger of any ultimate loss. Yet the banks on this occasion decided to refuse their notes, which decision they were afterwards obliged to rescind. And this is a very good proof that it was wrong from the first; and immediately that the notes were taken the panic ceased.

329. In the years of the great speculations in railways, numbers of persons wished to carry on the game of speculation by buying shares, and then raising money upon them from bankers. The old banks prudently declined this sort of business, and a number of banks were got up, principally for this business—if, indeed, it can be called business at all—as it was, in fact, pure gambling. After a short time, the railway shares went down as fast as they had risen, and all these banks, which were called Exchange Banks, were ruined, some of them under the most disastrous circumstances.

330. We have said that one of the principal features of the Scotch banking system is to have a small number of very large banks, with a great number of branches to each. To shew how the system has a natural tendency to become concentrated among a few great establishments, we may compare the existing number of separate institutions, at different periods. In 1826, there were 32 in-

dependent banks, of which 13 had less than 10 partners, 10 had less than 100, and the remaining 9 had more than 100. Fourteen of these had no branches, 17 had not more branches than 5, and the highest number that any bank had was 30, which was the Commercial Bank. The total number of offices was 159. In 1848, there were 391 branches; in 1855, there were 462 branches, and 17 principal offices; in 1857, there were the same number of head offices, with 666 branches; and in 1859, there are 14 separate banks—one the Union, having 4 head offices—and 597 branches, making altogether 615 offices.

Historical Sketch of the Rise and Progress of Banking in Ireland.

331. The origin of banking in Ireland, is, as far as we can discover, involved in much obscurity. We cannot but suppose, however, that it could not have been long delayed, after it had reached Scotland. We may, however, be somewhat surprised that after the institution of the Bank of Scotland, it does not appear that any one for a very considerable period thought of founding a public Bank in Ireland. The earliest evidence that we have of a banking firm in Ireland, is in 1700. The first public act in which the existence of bankers is recognised is the Irish Act, Statute 1709, c. 11, being *An Act for the better payment of inland bills of exchange, and for making promissory notes more obligatory*. By this Act it was enacted that the acceptance of every inland bill of exchange of, or above £5, should be in writing on the bill itself, which was not made law in England till 1821. It also declared that as promissory notes were not held to be within the law merchant, so as to be assignable or indorsable over to any one else, after the 1st of September, 1709, any promissory note signed by any person, or by the servant, or agent of any banker, goldsmith, merchant, or trader, should be negotiable in all respects as an inland bill of exchange. Another Act also, Statute 1721, c. 14, recognizes that the trade of the country was greatly carried on by bankers' notes.

332. In 1721, the first project that we have been able to discover was started for a National Bank. To this three peers, 47 members of parliament, a considerable number of merchants and traders, and others subscribed, but the subscription was not filled up, and the project was given up.

333. The plan of a national Bank having failed, the trade continued in the hands of private bankers, and there are several Acts passed for the relief of the creditors of various firms that failed in 1733, 1755, and 1759. In 1753 the competition of the private bankers in Dublin was so great, that out of every £1,000 there was not more than £10 of gold. The exchange rose 3 per cent. above par, i.e. the paper currency was depreciated to that extent. The natural consequence followed. All the specie left the country. The bankers themselves collected as much as they could, to remit to London, to purchase bills at 4 per cent. above par. The inevitable result of this ensued. In the next year every bank in Ireland, but two, failed, and these two paid off all their paper. Thus the entire paper currency was destroyed, the exchange fell to 2 or 3 per

cent. below par, i.e., the value of the currency rose from a depreciation of 3 per cent. to a premium of 2 or 3 per cent., in consequence of the contraction. But the convulsion was exceedingly severe, multitudes of people were ruined, many tenants threw up their lands, and scarcely a person in the three Southern provinces of Ireland but was affected. In 1755, while the country was yet suffering from this general catastrophe, an Act was passed to prevent bankers trading as merchants in goods or merchandize imported or exported, and great difficulties being found by the creditors in obtaining payment of their debts, an Act, Statute 1759, c. 14, commonly called the Bankers' Act, was passed to regulate the trade of banking. The chief provisions of this Act are—

I. All deeds and conveyances made, or to be made by any banker, or bankers, before the 1st of August, 1760, whereby any real estate should be granted, released, mortgaged, demised, or any ways incumbered, or affected, which should not be registered, or inrolled, according to the Act, Statute 1721, c. 14, shall be deemed fraudulent and void against all creditors of such banker, or bankers. And that all deeds and conveyances, after that date, made in Ireland by any banker, or any person empowered to do so on his behalf, whereby any part of his real estate, or leasehold interest, or whereby any mortgage belonging to any banker, upon any lands, tenements, or hereditaments, or leasehold estate, should be in any way incumbered, or affected, except only by way of lease for three lives, or thirty-one years, at the full improved rent, without fine, should be duly registered, within one calendar month, from the execution thereof by any such banker, or other person for him; and if such deed was executed out of the kingdom, it must be registered within three calendar months from the time of its execution; and that for want of such registry, every such deed should be deemed fraudulent and void against all the creditors of the said banker, even though made, or given, for valuable consideration.

II. After the 10th of May, 1760, all grants, sales, alienations, leases, or dispositions made by any banker during the time he continued to be a banker, of any part of his real estate, or of any interest he held in real or leasehold estate, to, or to the use of, or interest for, any son, or grandson, daughter, or granddaughter of such banker, should be utterly void against every creditor of such banker, though made or given for valuable consideration; and though such creditor was, or was not, a creditor at the time such grant, sale, alienation, lease, or disposition was made.

III. After the 10th of May, 1760, no banker should issue or give any note, or negotiable receipt, or accountable receipt, with any promise or engagement therein contained for the payment of any interest. And that all notes, or receipts, given in contravention of the Act, should be absolutely null and void.

IV. If any banker failed to pay any note, negotiable receipt, or accountable receipt, issued by him or his lawful agent, on demand, when the same became due, his heirs, executors, and administrators should be bound to pay all such sums so due, with legal interest from the time of demand to the time of payment, unless any agreement had been made to the contrary between such banker and his creditor.

V. If any banker, after he stopped payment, should receive or discharge any sum of money due to him at the time he stopped payment, every such receipt or discharge should be null and void. All deeds and conveyances made by any banker after he had absconded, or stopped payment, although made for valuable consideration, should be null and void, unless made for the use of, and in trust for, all his creditors, according to the order in which their respective debts should be paid; or unless they should be accepted and agreed to by all his creditors.

VI. Immediately after any banker should abscond, conceal himself from his creditors, or stop payment, all his property of all sorts and descriptions, both at law and in equity, or which he should be entitled to at the time of his death, should be liable and subject to all and every his debts, of what nature or kind soever, the same should be, except such as he should contract before he became a banker, or those secured by deeds duly registered.

VII. No banker who should abscond, conceal himself from his creditors, or stop payment, should have any privilege of Parliament.

VIII. All promissory notes issued by any bank, that should stop payment in future, should be paid before any receipt given, or issued, by the bank.

IX. No person intrusted with any public money should be a banker, or discount, under heavy penalties for each breach.

X. If any banker should discontinue business, all his creditors must make demand upon him for payment of his notes and receipts, within three years, otherwise their claims should be barred.

334. In the year 1782, at last, an Act was passed after great opposition, to establish a public bank in Ireland. The chief provisions of this Act, Statute 1782, c. 16, are as follows:—

I. The king was empowered, by a commission under the great seal of Ireland, to authorize and appoint any number of persons, at any time after the 1st day of August, 1782, until the 1st January, 1784, to receive subscriptions from any persons, to pay into the Irish treasury the sum of £600,000 sterling, to be paid in money, or treasury debentures bearing 4 per cent. interest, which should be received at par, and considered as money.

II. If any person should be willing to pay a premium upon the stock, such premium should be applied to the purposes of the bank.

III. The king might, by letters patent under the great seal of Ireland, limit, direct, and appoint, in what manner, and in what proportion the said sum of £600,000 should be made assignable and transferable to such persons as should freely and voluntarily accept it, and to incorporate the proprietors by the name of the Governor and Company of the Bank of Ireland, with full capacity to pay, possess, and enjoy all lands, rents, tenements, and hereditaments, of any kind, nature, or quality whatsoever, and to dispose of them in any way, and to enjoy the other usual privileges of a corporation.

IV. No single subscriber, whether private or a body corporate, to subscribe for more than £10,000 sterling, one-fourth of the subscription to be paid down, and the remainder before the 1st January, 1784.

V. In case the whole sum was not subscribed for before the 1st January, 1784, the Act was to be void, and all debentures and money lodged with the commissioners should be given back to their owners.

VI. The said corporation should not borrow, or give security by bill, bond, or note, covenant or agreement under their common seal, or otherwise, for any sum of money exceeding in the whole £600,000; nor should they, at any future time, owe more than that, unless by some future Act of Parliament. And if their debts or liabilities at any future time exceeded that sum, then the members of the corporation should be liable in their private capacities in proportion to their respective stock.

VII. The interest granted by the corporation for money lent to them should not exceed 5 per cent., and they were not to discount at a higher rate than 5 per cent., under penalty of treble the sum lent.

VIII. They were especially debarred from lending or advancing any sum of money, secured by mortgage, or sale of lands, tenements, or hereditaments, redeemable.

IX. They were forbidden by themselves or their agents, to deal or trade with any of the stock, monies, or effects of, or any way belonging to the said corporation, in the buying or selling of any goods, wares, or merchandizes whatsoever, under penalty of treble the value of the goods dealt with. But they were permitted to deal in bills of exchange, or to buy and sell bullion, gold, or silver, or to sell any goods, wares, or merchandizes whatsoever, which should really, and *bond fide*, be left, or deposited with them, for money lent, or advanced, thereon, and which should not be redeemed at the time agreed upon, or within three months after, or from selling such goods as should be the produce of lands purchased by them.

X. All their bills obligatory, and of credit, under their seal, and issued to any person, might, by indorsement thereon, by such person, be assigned and transferred to any one else, and so on, any number of times, by indorsement, and such assignment should vest all property in the said bills, and money due thereon, in the holder, who might sue in his own name.

XI. If the corporation, or any member of it, should purchase any lands, or revenues belonging to the Crown, or advance, or lend to the Crown, any sum of money in any way whatever, except by the special authority of Parliament, then every such person should forfeit treble the sum so advanced, one-half to the informer.

XII. If any person obtained any judgment against the corporation, for any debt or sum of money, and should bring execution thereon to the officers of the exchequer, they were required to pay the sum due to the plaintiff, and deduct it from the annual sum due to the corporation.

XIII. After the passing of this Act, no body politic or corporate should be erected into a national bank, nor should any private partnership, exceeding six persons, borrow, owe, or take up, any sum or sums of money, on their bills or notes, payable at demand, or at any less time than six months from the borrowing thereof, under a penalty of treble the amount so due.

XIV. No member of the corporation should be subject to the bankrupt laws, in respect of his

stock, and no stock of the corporation to be liable to any foreign attachment.

XV. The stock of the bank was to be personal, and not real, estate. And the annuity payable by the Crown was not to be liable to foreign attachment. All the debentures given in by the subscribers to be cancelled, and an annuity of £24,000 to be given to the proprietors of the stock, for the use of the subscribers to the bank.

XVI. At any time, upon twelve months' notice, after the 1st January, 1794, published in the *Dublin Gazette*, and repayment of the principal sum of £600,000 and all arrears, without any deduction whatever, or at any time before the 1st January, 1794, upon repayment of the said sum, and by the desire and consent of the said governor and company, duly expressed, the corporation was to cease and determine.

XVII. In case of the determination of the said company, in consequence of such notice, or request, or in case of insolvency, before any distribution or dividend shall be made of the said stock, or the produce thereof, the said governor and company shall be obliged, in the first instance, to apply the said stock, and the produce thereof then on their hands, or a competent part of the same, to discharge and pay off the total sum of the debts which they shall owe to others; and in case the same shall not be sufficient to pay off and discharge such debts so due to others, that then each member of the said corporation shall, in his, her, or their private capacity, according to the proportions of their respective interests in the said capital stock, be liable to the payment of such debts, until the whole shall be discharged.

XVIII. The dividends are to be payable every six months.

XIX. No transfer of stock to be valid, unless registered in the Bank's books in seven days from the contract, and actually transferred in fourteen.

XX. No act done by the corporation should forfeit or affect the private estate of any member of it.

335. The Bank began business on the 25th June, 1783. In 1791 by the Act, Statute 1791, c. 22, the Corporation was erected into a perpetual corporation, subject to the proviso, that at any time upon twelve months' notice, to be given after the 1st of January, 1816, and repayment of all parliamentary debts due to it, or upon their own desire, as in the former case, the corporation might be dissolved. The Company was allowed to increase its capital to £1,000,000; £200,000 to be subscribed and paid up on, or before, the 24th June, 1796, and the remainder on or before the 24th June, 1801; and this additional sum might be applied to their banking business. The new subscribers were to be incorporated, and the Bank might then increase their liabilities to the amount of £1,000,000. Part of the additional profits, however, to be made by this increase of capital, were to go to the public. And if the said sums of £200,000 each were not subscribed, and paid, within the time limited by the Act, the Company should lose the benefit of the Act.

336. In 1797 the Bank was authorized by the Act, Statute 1797, c. 50, to increase its capital to £1,500,000, provided the new stock was subscribed and paid, before the 17th February, 1798, in certain instalments provided. The new sub-

scribers to be incorporated as the old ones, and the Bank was allowed to increase its liabilities to £1,500,000. The new subscription of £500,000 was to be paid into the Exchequer, as a loan to the Crown, for which the sum of £25,000 was to be paid as interest, by two half-yearly payments; and besides that, an annuity of £3 12s. 6d. per cent. for nineteen years from the 24th of June, 1797. The sum of £2 10s. per cent. was allowed as discount for prompt payment. The interest granted on the first loan of £600,000 to Government was raised to 5 per cent.

337. An Act also was passed to confirm and continue the minute of council of the 2nd of March, 1797, directing the Bank to suspend cash payments, as the Bank of England had been ordered to do on the 27th February. During the restriction no action was to be maintained by any person against the Bank for the payment of any note, for which they were ready to give a note of equal amount in exchange. And any Court of Law might stay proceedings in any action to enforce payment until the restriction should be taken off. The Bank might pay any sum less than 20s. in cash, and any sum for the payment of the army or navy, in pursuance of an order of council, which was to be laid before Parliament within three days. But the Bank might receive any sum in cash from any person, not being less than £50, and agree to repay three-fourths of it. All payments in the Bank's notes during the restriction should be deemed payments in cash, if made and accepted as such. And no person who made a tender of the Bank's notes in payment, should be held to special bail. The restriction on the Bank should continue for three months after the restriction should be taken off the Bank of England, unless sooner ordered to cease by the Lord Lieutenant.

338. In 1799, the abuses which developed themselves both in England and Scotland, under the power of unlimited issues possessed by every one, were very annoying in Ireland, and the Act, Statute 1799, c. 48, was passed to remedy them. It enacted that in future, all promissory or other notes, or negotiable obligations for the payment of less than five guineas, except such notes under 20s., as were allowed to be issued by registered bankers, not resident in Dublin, should be made payable to some certain person or persons named, and their place of abode specified therein. That they should bear date before, or at, the time of issuing them, and not any subsequent date, and should be payable within twenty-one days next after the date thereof, and should not be negotiable after that date. All indorsements were to be made before that time, and all signatures and indorsements to have at least one attesting witness, whose name and abode were to be written on the note. During the restriction on the Bank of Ireland, any person might make, issue, or draw any inland bill of exchange, or obligation, for any sum not less than three guineas, and for no sum below it, and any such obligation, between three guineas and five guineas, should be made payable to the person by whom, or for whose use the value of such obligation should have been paid, and no one else. Such obligations were to be drawn in accordance with the previous provisions of the Act. All obligations under five guineas were to be payable only to the person who gave value,

under the penalty of forfeiting treble their value. All obligations for sums under 20s. were to be payable in cash on demand, and only to be issued by registered bankers. For the convenience of traders, registered bankers, not resident in Dublin, might issue obligations for 9s., 6s., and 3s. 9d., singly, and not in sheets, and the holders might demand payment in Bank of Ireland notes, and in no other form.

339. We have observed that, on the passing of the Bank Restriction Act in England, it was generally expected that their notes would fall to a discount, but that for a year or two their issues were made with so much discretion that no discount took place. In 1800, however, owing to the famine, and commercial embarrassments at Hamburg, a great drain of gold occurred, and the paper price rose to £4 5s., and the exchange fell very rapidly. It was at this time that the great discovery was made, *that the rise of the paper price of gold above the Mint price was the proof and the measure of the depreciation of the paper currency.* The first writer, whom we are aware of, who called public attention to this, was Mr. Boyd, in a letter to Mr. Pitt (Boyd). In a short time, however, the paper price of gold fell, and was not higher than £4, and no very great practical inconvenience being consequent upon this, the subject dropped out of discussion. The issues of the Bank of England were in a very severely contracted state in February, 1797, at the time of the suspension, and many very able writers, indeed, attributed the suspension to the severity of the contraction. After that, they had increased, but not to any very immoderate amount. But when the directors of the Bank of Ireland were relieved from cash payments, they lost all notions of prudence. In the space of six years they increased their issues to all but five times their amount at the time of the restriction. For while on the 1st January, 1797, they were £621,917, by the 1st of April, 1801, they were £2,266,471, and by November, 1803, they were £2,911,628. And the exchange between Dublin and London had fallen very rapidly, and proportionably to these increased issues. At this time, it is necessary to mention that the Irish shilling contained 13d., and as both the English and Irish pound contained 240d., a slight calculation will show that £100 sterling = £108 6s. 8d. Irish currency. Consequently, the par of exchange between Ireland and England was called 8½. Hence, whenever the exchange was below 8½, it was *favourable* to Ireland, and whenever it was above 8½, it was *adverse* to Ireland. During the first year of the restriction, the exchange between Dublin and London was favourable to Dublin, the exchange at the close of the year being 7. But immediately after that it began to fall, and at the close of 1798 it had fallen to 9½, at the close of 1799 to 14½. In 1800 it rose to an average of 11½, but this was during the period when the English exchanges had fallen very low, and the paper price of gold had risen to £4 5s. In 1801 the average was a little below 13, in 1802 it was slightly higher, but in 1803 it rapidly fell, and in November was at 19. At this time the issues of the Bank of Ireland were £2,911,628.

340. This extraordinary derangement of the exchanges was productive of the utmost mischief and confusion to all commerce, and was repeatedly,

as stated by Lord King, brought before the notice of Parliament in the debates on the Irish Bank Restriction Bill, though it does not appear in the meagre reports that have come down to us. It also attracted the forcible attention of economists, and in 1803 and 1804 appeared two most able and remarkable tracts, one by Lord King and the other by Mr. Henry Parnell, afterwards Sir Henry Parnell, and Lord Congleton, forcibly supporting the doctrines previously propounded by Mr. Boyd, that the depression of the exchange below the cost of transmitting bullion from one place to another, was the proof and the measure of the depreciation of the paper currency. Both these pamphlets deserve the most attentive study, because they most clearly and unanswerably establish the great fundamental proposition of a paper currency—*That a rise of the market, or paper, price of gold above the Mint price, and a fall of the foreign exchanges, beyond the cost of transmitting bullion from one place to another, is the proof and the measure of the depreciation of the paper currency.*

341. Lord King's pamphlet, too, is especially remarkable as containing the first formal protest against Adam Smith's doctrine, that as long as the issues of Bank notes were confined to the discount of mercantile bills, founded upon real transactions and of undoubted solidity, they could not exceed the amount which would necessarily circulate, if the currency was purely metallic, and therefore could not be excessive. This doctrine was stoutly maintained by some of the witnesses in the Parliamentary Inquiry, which will be shortly noticed, as well as by the Directors of the Bank of England before the Bullion Committee. This doctrine is very specious, but perfectly delusive, and Lord King has the merit of first declaring its fallacy. These two little treatises must therefore be considered as among those which have established fundamental principles in Political Economy, and will be found fully analysed in their proper places (KING, LORD), and (PARNELL). They also deserve to be particularly mentioned, because they are the true founders of a doctrine whose discovery many persons most unjustly attribute to Ricardo in 1809. And the phenomena, we are now going to consider, are precisely the same as those which led to the appointment of the Bullion Committee in 1810.

342. In 1804 the extravagant issues of the country bankers and others reached such an intolerable height, that all the monetary transactions between Dublin and London were deranged, while those between Belfast, where nothing but specie was current, and London, were perfectly regular. In the debate on the Irish Bank Restriction Bill, February 13, 1804, Lord Archibald Hamilton called the attention of the House very strongly to the evils of the excessive issues of paper. At the time that the Bank of Ireland Restriction Bill passed the Irish House of Commons the amount of notes issued was £600,000, and at that time they were £2,700,000. While the par of exchange between Ireland and London was 8½, it was then 17, 18, and even 19 per cent., and in some instances 20, and thus an Irish gentleman who came to attend his duty in Parliament, found at the end of his journey, where he had allotted £500 for his expenses, that only

£400 were to be received. Mr. Foster declared that he did not believe that there was one real shilling to be found from one end of Ireland to the other; there was even a scarcity of brass. Mr. H. Thornton, one of the authors of the bullion report, said that it appeared to him clear, that the excess of paper circulation was the cause of the bad state of exchange in that country.

343. The state of the exchanges between the two countries was productive of so much inconvenience, that on the 2nd March, 1804, Mr. Foster moved for a committee of the House of Commons to inquire into it. He said that guineas were then at a premium of 2s. 4d. or 2s. 6d. in the current paper of the country, and whatever causes it might be attributed to, the whole bank paper of Ireland was then at a depreciation of 10 per cent. But even that was not the worst. There was scarcely anything in the shape of money to be seen, but a miserable coinage of adulterated copper, and of counterfeit shillings, so bad, that for a pound bank note even at its depreciated rate, twenty-six or twenty-seven of such shillings would be given in exchange. Mr. Ponsonby said that no man, who had not been in the country, could form any conception of the distress from the state of the currency. There was not to be found in the country parts of Ireland except in the north, any description of coin whatever, except some very bad copper; silver or gold there was none. But as something must be used for circulation, there were many persons who, without any capital whatever, set up a kind of banking shops, and issued notes of 6d. or a 1s., and a note for 3s. 6d. was considered as a very large one. Mr. Fox, too, saw clearly that the bank paper was depreciated, and not the guinea that was raised. A committee was then appointed to inquire into the causes of the extraordinary state of the exchange between Dublin and England, and the state of the currency in Ireland.

344. The circumstances which gave rise to the appointment of this committee, and its report, are deserving of great attention, as this was the first parliamentary investigation into the theory of the paper currency, and they are the antetype of what afterwards occurred in England, and gave rise to the appointment of the Bullion Committee.

345. The evidence given before this committee of the state of the currency of Ireland, was most extraordinary. Mr. D'Olier, a director of the Bank of Ireland, had some of the base currency in circulation weighed. He found that it took 128s. to the pound weight, such as remained of the old mint issues weighed 94s. 6d. to the pound, being delivered at the rate of 62s. to the pound. He estimated that the best of the base silver shillings were not worth 6d., and the worst about 3d. The makers of this base coinage sold it to persons who had an opportunity of circulating it, at the rate of from 28s. to 35s. the guinea. Mr. Roach said, that in the South of Ireland, the silver currency had entirely disappeared from circulation, and its place was supplied by the issue of silver notes. These, together with the increasing issues of bankers' notes of all descriptions, had enhanced the price of all articles of the export trade above their natural value, and had created a degree of false credit in the southern parts of Ireland, which increased the prices of land, &c. These issues of

silver notes were constantly increasing, especially during the last twelvemonths. He said that there was in reality a very good supply of real silver in the south of Ireland, which was hoarded and concealed, and which would again come into circulation, if these silver notes were suppressed as they ought to be. Traders almost universally issued notes for 3s. 9d., and 6s., payable to bearer at twenty-one days after date, to evade the law. Mr. Colville, a director of the Bank of Ireland, thought there might be some small proportion of mint silver, greatly worn, in circulation in Dublin, but not more than 2 per cent. This had been gradually getting worse and worse for more than five years. Crowns and half-crowns, originally issued from the mint, were not circulated, but kept as curiosities, and from the high state of the exchange, the best pieces were carefully picked out for exportation. There were at this time in Ireland 7 bankers issuing bank notes, 28 issuers of gold and silver notes, 62 issuers of silver notes, and 128 issuers of I. O. U.'s. In the Youghall district alone, there were 70 issuers of currency, of which 62 issued I. O. U.'s, from 6s. down to 3d.

346. In the North of Ireland, where nothing but gold was current, the exchange at Belfast with London had always continued favourable to Belfast, and even while the exchange at Dublin was progressively sinking, the exchange at Belfast continued to rise. From 1794 to the end of 1798 the exchange had been invariably favourable to Dublin, being generally about 7½, and sometimes even so high as 5, but at the end of 1798 it fell to 9; during 1799 it fell rapidly to 14 in the beginning of December, but it being expected that Bank of Ireland notes would be exchanged for those of the Bank of England, it rose to 9, and continued a little below that rate during 1800, but at this time the Bank paper in England had fallen to a considerable discount. In 1801 it began steadily to fall again, and this became much more rapid and severe during 1803. In August and September of that year it reached a depression of 19, and though it afterwards rose to 13, it continued to exhibit the most extraordinary fluctuations, and was at 18 at the end of January, 1804, when it was brought before the House. The following figures exhibit the difference of the exchange on London between Dublin, where all the currency was paper, and Belfast, where it was all specie:—

1802	Dublin.	Belfast.
Average of	£. s. d.	£. s. d.
1st Quarter . . .	11 5 11	6 13 4
2nd " . . .	11 11 3	7 15 0
3rd " . . .	11 2 7	8 0 10
4th " . . .	10 13 5	7 3 9
1803.		
1st Quarter . . .	11 1 9	7 12 6
2nd " . . .	13 8 11	8 8 8
3rd " . . .	15 17 0	7 12 6
4th " . . .	15 8 7	5 12 6
1804.		
January 27 . . .	18 0 0	6 0 0

At Newry, which was a kind of debateable land between specie and paper, the exchange upon London, according as bills were purchased with specie, or bank notes, was as follows:—

1803.	Specie.	Bank Notes.
	£ s. d.	£ s. d.
January . . .	7 17 6	12 17 6
April . . .	8 0 0	13 0 0
July . . .	8 10 0	13 10 0
October . . .	6 0 0	15 10 0
1804.		
January . . .	6 0 0	15 10 0

In 1696 the extremely depreciated state of the silver coinage of England had turned the exchanges, greatly against this country. But it was a principle perfectly well known to the merchants of that time, as any one who reads the pamphlets of that period may see, that the *real exchange between any two places could never vary more than the cost of sending bullion from one place to the other.* The question, therefore, before the committee was, to what could this extraordinary state of the exchange at Dublin on London be owing? Especially what could be the reason of the difference of the rate between Dublin and Belfast? One set of witnesses plainly and unhesitatingly declared that it was owing to the over-issues of bank paper in Dublin.

347. When the directors of the Bank of Ireland were asked whether they thought the Bank's notes were depreciated, they indignantly repudiated such a notion. Mr. Colville, being asked what could be the motive for so large an increase in its issues, as from £600,000 to £3,000,000 in so short a time, said that the course of exchanges having about two years after the restriction become very high, and greatly against Ireland, the money of the country was carried out of it, for the purpose of paying the balance of remittances against Ireland. The consequence was, that as the circulating medium of gold decreased, it became necessary to supply its place with paper. He said that, after the restriction, it was necessary to supply notes for the payments that would have been made in guineas, and this amount he placed at £1,200,000. He said that he thought it was a very great error to suppose, as was generally done, that the extension of paper in Ireland has been a cause of raising the exchange; in his opinion it was directly the reverse, inasmuch as the circulation of paper supplied the circulating medium, it enabled the gold, which before stood in its place, to be exported out of the country, and, as far as it went in weight and measure, so far it was a clear and decided cause of preventing the exchange from getting to a higher pitch than it had hitherto attained. And it was evident that the more paper issued by the Bank, in consequence of an extension of loans, so far as it further extended the notes of the Bank, it further enabled a greater drain of specie to take place, and consequently to strengthen the cause, which kept down the rate of exchange. This witness attributed the state of the exchanges exclusively to the fact, as he alleged, that Ireland owed a great deal more money than she was able to pay. These opinions he repeated over and over again.

348. We shall find in this witness's evidence one of the most curious specimens of reasoning in a circle, that can be easily met with. He was asked—"To what do you attribute the unfavorable exchange which has existed between Dublin and London?—I decidedly and clearly consider the sole efficient cause to be that Ireland owes a great deal more money to Great Britain than she is able to pay.—What do you take to be the true criterion of such balance of debt?—The true criterion I take to be, the state of exchange between Dublin and London, and London and Dublin.—Explain your reasons?—When exchange is considerably above par, it is said to be against Ireland, and in that case certainly, at that time Ireland owes more money than she is able to pay." That is to say, the *reason* why the ex-

changes were unfavorable, was *because* Ireland owed money, and the *proof* that she owed money was *because* the exchanges were unfavorable! Marvellous logic! He was asked if the rate of exchange could be influenced by the value of the medium in which the balance of debt between the two countries was paid, as if, for instance, it was paid in a degraded or adulterated coin. He admitted it might be so if paid in base coin, but he denied that such views in any way applied to Bank of Ireland paper.

349. Mr. D'Olier entirely coincided in these views; being asked—"Do not you conceive that there may be an augmentation of Bank of Ireland paper, which may be so large as to have the effect of diminishing its value in exchange for goods, supposing bank paper to be not now convertible into coin, and that the public confidence in the ultimate solvency of the Bank, and even in the certainty of the Bank paper being again converted into gold, at some remote and indefinite period, may be perfectly maintained?—I think it possible, but by no means probable. I have heard it stated that, because gold is bought at a premium, that therefore Bank of Ireland notes are by so much depreciated, and at an absolute discount to the amount of that premium, but I do not conceive that that is the way to look at the question. The circulation of the paper said to be depreciated, must first be proved to have become burdensome to the holders, and bargains to have been made by unnecessary purchasers to get rid of that which they found inconvenient or were apprehensive to hold. The mere buying of gold at an advanced price beyond that of the Mint is the effect, and not the cause, of the exchange, and therefore no proof of the depreciation of the paper itself."

350. The theory of these gentlemen was, that the exchange could only be depressed on account of money being remitted, and that it might be depressed to any extent in proportion to the money that had to be remitted. Now, if this theory was true, it happened, as may be seen from the above figures, that while the exchange was adverse to Dublin, it was favourable to Belfast; consequently, while enormous remittances were making from Dublin to London, there must at the same time have been large remittances making from London to Belfast. Nay, the phenomena at Newry were more astounding still, for at that place, when payments were made both in specie and paper, the exchange, if paid in specie, was favourable to Newry, and if paid in paper was adverse; consequently, that reasoning would show that London was largely in debt to Newry, and Newry enormously in debt to London!

351. Mr. Colville fully admitted, that before the restriction, the Bank was obliged to contract its issues during an unfavourable exchange and a drain of guineas. He was asked, "Was it the practice of the Bank, antecedently to the restriction, in any degree to restrain the total amount of its loans, when it experienced a diminution of cash in consequence of an unfavourable exchange, or of any other circumstances producing a drain of its guineas?—It must be very obvious that, if the directors of the Bank did not pay a very great attention to such an important consideration, they would be very unfit to conduct the business put under their care. Do you mean, then, to say, that they were accustomed to lessen the total

amount of their loans, including loans in the way of discounts, when they found their guineas going from them?—*I certainly do.* Did not that limitation of loans necessarily operate as a limitation also of the total amount of their circulating paper to an equal amount?—It certainly does generally, but from the nature of the case, it is impossible to state the specific proportion. Would not the Bank paper, in such a case, be necessarily reduced, not only in the degree in which the loans were reduced, but even in a still greater degree—namely, in the same proportion, also, as the gold of the Bank was diminished?—It certainly would; and in the former answer given I think I have explained it. * * * Do you admit, then, that, antecedently to the restriction, the paper of the Bank of Ireland naturally diminished itself whenever gold was drawn out of the coffers of the Bank, supposing even its loans to remain the same?—As the notes came in for payment of the cash, the cash was diminished, and the circulation of paper was diminished in the same proportion; but in all these cases the prudence of the Bank induced them to call in their loans, in order to strengthen the Bank provisionally against the continuance of such a drain," p. 102-3. There is a good deal more of evidence to the same effect, the gist of which is, that before the restriction the Bank instinctively felt it their duty to contract their issues during an adverse exchange, no matter how good the bills presented for discount were.

352. But at this time the doctrine of Adam Smith was brought forward, which we have noticed above, as having been denounced by Lord King, that the Bank's issues could not be excessive, so long as they were advanced on mercantile bills of undoubted solidity, and based on a real transaction. The directors of the Bank of Ireland, of course, were not likely to admit that their own notes were depreciated, because that would be condemning themselves. Several of the other witnesses maintained the same doctrine. Mr. Irving, a merchant of London, was asked, "Do you deal with Ireland?—I do; I know the Exchange has been high. Has there been a depreciation of circulating paper in Ireland?—I have heard so. Is it your opinion that it has been depreciated?—It is not. Have you heard that guineas have been purchased for a premium there?—I have; and I believe it. Do you not think, of course, that paper is depreciated, when guineas are bought at a premium?—I do not. Explain your reasons.—I am of opinion that a bank, managed with prudence, would only issue its notes in proportion to the demand, which may be made for those notes, in exchange for good and convertible securities, such as mercantile Bills of Exchange, payable at specific periods, of undoubted respectability, founded upon real mercantile transactions, upon government securities, such as Exchequer Bills, in the purchase of Spanish dollars, or other bullion; and the circumstance of the bank notes of Ireland being demanded for such good and convertible securities, I am of opinion, is a proof that they are not too large in amount, and that their value has not depreciated." * * * Another reason why I am of opinion that Bank notes have not depreciated in value is, that the interest of money has not been diminished. May not notes be depreciated in the value of their currency, although they are

in no way depreciated in the opinion of their security?—I think not, because, by a parity of reasoning, it might be said that a guinea is also depreciated; because, comparing the quantity of gold which is contained in a guinea, according to its Mint price, it would yield, according to the present market price of that commodity, a premium. Might not a greater quantity of notes being in circulation than the country requires, cause their depreciation?—Yes, I have already stated that Bank notes can only maintain their value, when they are demanded in exchange for good and convertible securities." Now, we shall not, in this place, investigate the accuracy of this theory, because it was reproduced with much greater force and emphasis before the Bullion Committee, and the Irish Committee pronounced no opinion upon upon it in their report. The Bullion Committee did investigate it, and condemned it. We only say here, that it is one of the most subtle and plausible theories ever started, but it is in reality only another phase of John Law's theory of basing a paper currency on land. If this theory were true, the whole public debt of Great Britain might at once be converted into notes, as well as all mercantile bills. It is only one form of Lawism. (BULLION REPORT. LAW.)

353. In 1696, during the recoinage of the silver money, the Bank of England stopped payment, and a difference arose between Bank notes and specie of 20 per cent., and between tallies and specie of 40 per cent., and it was universally said that Bank notes and tallies were at a discount of 20 and 40 per cent. respectively. There is no trace of any other language but that being applied to them. At the period we are now speaking of, the Irish Bank had suspended payments, and Irish Bank notes and specie exchanged at a difference of 10 per cent., so that it required a guinea note and 2s. 6d. to buy a guinea in specie. The merchants and statesmen of 1696 would have expressed this state of things by saying that the Bank note had fallen to a discount of 10 per cent. But at this period a new mode of expressing it was discovered; it was stoutly maintained that it was not the paper which was depreciated, but the guinea which had risen in value! or was *appreciated*, as the jargon was. Mr. Harman, whom we meet again before the Bullion Committee, was asked, "Do you know that the Bank of Ireland paper is depreciated?—I am not aware of it, because I should not say that paper was depreciated unless there was a forced issue of it, and that it was offered at a discount on all occasions; I should rather now say, that gold is increased in value, than the paper is depreciated. When 2s. is given in Ireland universally for the exchange of a Bank of Ireland guinea note into gold, do you not estimate that the note is depreciated to the amount of 2s.?—The distinction may seem nice, but guineas are wanted in Ireland chiefly for one purpose—the trade of the North, as I have understood—and as the transactions of the North are carried on by guineas only, I apprehend that is the cause. * * * Do you, then, think the present rate of exchange to depend wholly on the balance of payments due to Great Britain, and not to be affected by anything relating to the circulation of that country, as it at present stands?—I am inclined to think that the circumstances alluded to are sufficient to produce the evil. I do not say

there may not be other circumstances which may contribute towards it. I allude to the balance of debt which Ireland owes. * * * What do you consider to be the best criterion of the depreciation of paper currency, an alteration of its value, compared with the general property of any country, or its alteration compared with a given article, viz., guineas?—I think the first the best criterion, because guineas may be wanted, as in the present case, for special purposes. Is there not at present a difference between the value of Irish and English Bank paper in Ireland?—For the purposes of remittance, certainly. Do you not conceive that the fact of a premium existing on English Bank notes in Ireland, and exchanged for Irish Bank notes, affords some indication that it is Irish paper which is depreciated, and not the price of gold which is locally raised?—I do not."

354. It is remarkable that when Mr. Harman said that he considered the value of paper, as regards other things, a better criterion than its value compared to gold, he did not remember that the Bank notes were a "promise to pay" gold, and they were not a promise to pay anything else. The same opinions were expressed by other witnesses, who seemed to think that there could be no possible cause, which influenced the rate of exchange, but the remittances to be made to or from the country. When we consider the nature of an exchange, and the state of facts proved with regard to the Irish coinage at that time, we might almost smile at these ideas, and attribute them to the peculiar modes of thinking, which are sometimes prevalent on the western side of St. George's Channel. But we shall find that, when a precisely similar state of things took place in England, with regard to the foreign exchanges, the very same doctrines were long and stoutly asserted by a very numerous party in this country, and would probably be so again, under similar circumstances.

355. There was one witness, however, who held very different opinions—Mr. Marshall, Inspector-General of Imports and Exports of Ireland. Being asked, "What is the rate of exchange between England and Ireland, and how has it stood for some time past?—In order to answer that question, I will beg leave, in the first place, to state some facts which prove that Bank notes, including bankers' as well as Bank of Ireland notes, are not exchangeable for specie without a premium; and then I will proceed to state some acknowledged principles and facts relative to the rate of exchange, together with such opinions as I have been enabled to form on the subject. First, as to the premiums on specie. A premium has been taken upon exchange in Dublin ever since the year 1799, for exchanging Bank of Ireland notes for specie. The premium did not exceed 5 per cent. on the amount of the notes prior to the summer of 1803; but since that time it has risen to 10 or 12 per cent. Secondly, there are also specie shops, as they are now called, in some of the principal streets of Dublin, with these inscriptions over the door, "Guineas bought and sold here," and "Bank notes exchanged for guineas," &c. &c. About the time of the insurrection, the 23rd of July last, the retail price of a guinea in gold was a paper guinea and 2s. 8½d.; on the 31st December, 1803, the day on which I made my last inquiry on the subject, the retail

price of a guinea in gold was a paper guinea and 2s. 2d. Thirdly, about the end of December last, the price of a bill in Dublin upon London for £100 British was £116 10s. Irish, if purchased with Irish Bank notes, but if purchased with specie, the price was only £106 10s. Irish. Fourthly, but it is not only when we buy bills of exchange that we find out the premium, we perceive it also in all our domestic transactions; the man who goes to market with a guinea in gold, has an advantage, to the extent of the premium, over another going to market with a guinea in paper. The man with the guinea in gold calls in his way to market at a specie shop, and sells the guinea for a paper guinea, and the premium; he has then a bank note of equal value with that of the other man, and he has besides the premium. Fifth, the premium given with Bank of Ireland notes, when exchanged in Dublin for those of the Bank of England, is much the same as when exchanged for specie. From these facts, it appears that Irish Bank notes want 10 or 12 per cent. of the value of specie. Specie could not have risen so high in Ireland, or, which is the same thing, all her commodities could not have fallen so low as 10 or 12 per cent., and have continued in that state for any considerable time, circumstanced as that country is with regard to Great Britain; because such a degree of cheapness of all commodities in Ireland would have attracted specie from Great Britain, where it has not risen materially, and reduced the value of it to the ordinary level. But were it possible that specie should have risen with regard to all commodities in Ireland 10 or 12 per cent., or any supposable height, Bank notes which were issued for specie at its current value, whatever it may be, ought of course to have risen *pari passu*, and to be exchangeable for it, and therefore, whatever Bank notes may now want of this exchangeable property, must be considered as a falling off from their original value, or a depreciation to that extent. In speaking of Bank notes, I speak of the paper currency of Ireland at large issued by bankers. Are you of opinion that the paper currency of Ireland at large is depreciated?—I am clearly of that opinion, for the reasons I have mentioned. To what causes do you ascribe the depreciation of paper, whether from discredit, or over issue, or otherwise?—As to discredit, I never heard the solvency of the Bank of Ireland doubted by any one, and I am inclined to impute it to an over issue, but I cannot give a decided opinion; I mean an over issue of paper in general, and not of the Bank of Ireland particularly.”

356. Mr. Marshall then shewed most clearly, that the real exchange arising from a balance of payments was in favor of Ireland, and not adverse to it as appeared by the nominal exchange. That the exchange appeared to be against Dublin was owing to its always being computed in bank notes, which having ceased to represent the full quantity of specie for which they were issued, required an additional number of them to make up that quantity. This additional number swelled the exchange, and made it appear to be against Dublin, when in reality it was in its favor. The proof that the real exchange was in favor of Dublin was very simple, because bills of exchange purchased with specie in Dublin, or with Bank of Ireland notes equal in amount to specie at their

market price, would then yield about £1 16s. 8d more in London than they would cost in Dublin. Whereas during an unfavorable exchange a merchant could always get more for his bill in Dublin than in London. These facts decisively proved that the real exchange was in favor of Ireland.

357. Mr. Marshall put before the committee an elaborate statement, regarding the true state of the balance of debt, to which the lowering of the exchange was attributed; and also to shew whether the balance of debt influenced the depreciation of the paper currency. He said that there were some points involved in obscurity, but at the period of the suspension, it might be assumed that the balance of debt was in favor of Ireland, because the exchange was then steadily favorable to Dublin. Starting from this point, it might be shewn whether the circumstance which had arisen since had had any, and what, effect upon the state of things, assumed to have been favorable at that time. From this statement, Mr. Marshall shewed most conclusively, that the balance of debt which was favorable to Ireland at the time of the suspension, had since that event become still more favorable to it. Having shewn that in fact the balance of debt was in favor of Ireland, his second object was to shew whether it influenced the depreciation of the paper currency. He shewed that on the 3rd March, 1797, when the bank suspended cash payments, the exchanges were favorable, and during that year a larger quantity of specie was remitted to Ireland than had ever happened before. Nevertheless, while the specie was flowing into Ireland, the depreciation of the notes commenced. From August, 1801, to the time he was speaking, April 24, 1804, no remittances of consequence had been made to London in specie, “Bank notes, however, have never ceased, whether the specie was coming into Ireland, or going out of it; whether the exchange was under par or above par; whether the balance of debt was favorable or unfavorable, to be depreciated; and the depreciation appears to have been higher when the balance of debt was more favorable, and lower when it was less so; and upon the whole it is evident that the depreciation has not been influenced by the balance of debt. Do you mean, then, upon the whole of your evidence, to give it as your decided opinion, that the general balance of debt between England and Ireland, including trade, remittances, and every species of pecuniary transaction, has been each year since the restriction on specie, in favor of Ireland?—I do, very clearly, except during the two years of scarcity, and upon the whole six years taken together the general balance must have been considerably in favor of Ireland. Do you also mean, upon the whole of your evidence, to give it as your decided opinion, that there is, and has been, a depreciation of the paper currency of Ireland, and that the high rates of exchange which have prevailed, and still prevail, have arisen from that depreciation?—I do; the high exchange in Dublin, which has now continued for some years, MUST NO DOUBT HAVE ARISEN, LIKE ALL OTHER PERMANENTLY HIGH EXCHANGES, WHICH HAVE EVER EXISTED, FROM THE DEPRECIATED STATE OF THE CURRENCY, WITH WHICH BILLS OF EXCHANGE ARE PURCHASED, and the same remedy might perhaps be resorted to with success in the present case, which

has never failed to be effectual on all former occasions, namely, a removal of the depreciation."

358. We shall now give a somewhat full analysis of this report, because it is the first parliamentary investigation into the theory of the paper currency; and though, comparatively speaking, little known, it is one of the great landmarks of Political Economy. The report divides the inquiry, 1st, into the state of the Exchange, and 2nd, the state of the Currency. The first of these, namely, the state of the Exchange, is considered under three heads:—

I. As to the fact of an unfavourable Exchange existing, and to what extent.

II. As to the causes which have created it.

III. As to the remedies which can be resorted to, for either removing, or alleviating the inconveniences arising from it.

With respect to the first, tables of the rates of Exchange between Dublin and London, and Belfast and London, had been laid before them, showing a difference of 10 per cent between the two, in some cases. In the former place, bills were purchased with Bank of Ireland, and other bankers' notes; in the latter, with guineas. The exchange, if stated as between Belfast and London, appeared to be in favour of Ireland; if stated as between Dublin and London, to be uniformly against Ireland, ever since 1798, and to have risen to an unprecedented degree. The former they would call the real, and the other the nominal exchange, and the difference between the two arose from the depreciation of the circulating paper. It was true that some reasons were urged to shew that it was the value of guineas that was raised; but if a person who had a guinea could buy with it, a Bank of Ireland guinea note, and also two shillings; and if any one who wanted a guinea, must give a Bank of Ireland note, and also two shillings, it is evident that the paper being of so much less value than the guinea, is by so much depreciated, especially when exchange is the object of inquiry, which is estimated by the value of bullion, or specie; and the guinea, being the same coin current in England and Ireland, is the true standard to which the value of the circulating paper is to be referred. *It was not to be supposed that by any circumstances guineas can be rendered 10 per cent higher in Ireland than in England, when the expense of conveying them from one country to the other, does not amount to 1 per cent.* But further, the circulating paper of Ireland was equally depreciated, when compared with a Bank of England note. The same premium was given to obtain Bank of England notes as guineas; and they commanded the same premium as guineas. It was therefore certain that Bank of Ireland paper was depreciated. The causes and the effect of this depreciation on the rate of exchange they would inquire into afterwards. The point to be considered next was, whether the real state of the exchange was then favourable, or adverse, to Ireland; and this was to be kept separate from the degree or rate in which it was.

359. The exchange was unfavourable to a country when it sent more money away from it, than it received; because, of course, it must defray the expense of sending it. This expense, however, while guineas could be procured by the debtor country, could only amount to the actual

cost of transporting specie from one country to the other, and between Dublin and London did not amount to more than one per cent, including insurances; *but any excess in the rate of exchange beyond this, forms a separate consideration, and must arise from other causes.*

360. The real exchange, that is, where the bills of exchange are bought with specie, as in Belfast, being in favour of Ireland, during the whole of the year 1802, the committee examined documents to ascertain whether, upon the whole year's transactions, England was debtor to Ireland, or the reverse; and the investigation would satisfy those who thought that the state of exchange depends on the balance of payments, that the rise of the Irish exchange was not due to that balance. During that year, upon the different accounts, there could be no possible doubt that a very large balance was due to Ireland in 1802; if it was estimated according to Mr. Marshall's principle, it would be about £1,241,624. It was undoubtedly certain, therefore, that during 1802, the balance was in reality, favourable to Ireland, and there was every reason to believe it would be still more so during that year, 1804. On the lowest calculation, it would not be under £2,400,000. The Committee were therefore decidedly of opinion that the real balance of pecuniary transactions was greatly in favour of Ireland, and consequently, that the real exchange ought to be, and was, under par. They were therefore compelled to seek in other causes than the balance of debt, for the unfavourable exchange then subsisting between the two countries, and when they considered the length of time which it had continued, and its unprecedented rise, and that it was unfavourable not to the debtor, but to the creditor country, they concluded that the balance of debt had operated to lower an exchange rendered unfavourable to Ireland by other causes.

361. Without questioning the policy of the Irish Bank Restriction Act, it was adopted purely from English considerations. There was no drain of specie, the exchange was highly favourable to Ireland; nor had the Bank of Ireland any reason to dread any alarming demand upon it, as the Bank of England had. The restriction, however, was supposed to be a necessary consequence of the restriction in England. And to the consequences of that restriction, the committee attributed the unfavourable state of the exchange.

362. It compelled the Bank to refrain from sending into circulation gold, the only common medium between the two countries. Paper was issued to supply the place of the gold so withdrawn, and at the same time the best and most effective check against the depreciation of paper, namely, convertibility into gold at the will of the holder, was removed. The Bank, by being released from their engagements, were encouraged to make excessive issues, and the only criterion they formerly had, a diminution of their gold, which they were accustomed to look to for judging when their paper became excessive, was taken away.

363. The natural and constant effect of an adverse exchange, correcting itself by diminishing the issue of paper, was also counteracted by this measure. For when the exchange was so adverse as to draw gold out of the country, for every guinea drawn out of the bank, an equal

quantity of paper must be paid in to buy the guineas. Besides that the directors would be probably induced to lessen their discounts, so that the quantity of paper is reduced in a greater degree than the gold withdrawn.

364. Such was the natural practice of banks before the restriction. And such, as stated very clearly by Mr. Colville, was the practice of the Bank of Ireland before the restriction. If prudence had not dictated such a course, necessity would have compelled a diminution of issues, by diminishing the stock of specie, which could only be replaced at a loss, proportionate to the existing rise of exchange, and the committee declared *that in fact as well as in theory, the result of such practice always was, and must be, the redress of the unfavourable exchange.*

365. But the Restriction Act freed the directors from that necessity, and so far from contracting their issues in consequence of the unfavourable exchange, they had increased them, which the state of the exchange would have prevented them from doing, if they had not been relieved of the obligation to pay their notes in cash. The fact of the excessive issues of paper in 1753-54, and the adverse exchange which accompanied it, proved that excessive issues of paper produced a corresponding rise in the rate of exchange, and when the excess of paper was annihilated by the failure of the bankers, the exchange immediately became favourable. The reason was obvious—the nominal rates of exchange are influenced by the medium in which the payments are made, and the quantity of that medium, necessary to effect a given payment, must be increased as the value of the medium diminishes. This must equally take place, whether the payments are made in a degraded or adulterated coin, or in a depreciated paper.

366. The exchange between London and Holland in 1694 was a case in point. The currency of England was then degraded 25 per cent. below its proper value, and the exchange with Holland was 25 per cent. against England. As soon as the coin was reformed, the exchange fell to par. If paper, therefore, by depreciation comes to represent a less quantity of money than it professes to do, it must make the exchange which it has to pay appear unfavourable, in the same manner as coin, which contained less gold than it ought, would do. And the removal of the degradation in the one case, and of the depreciation in the other, would have the same effect in bringing the exchange to its true state.

367. The committee thought it probable that this depreciation in Ireland arose almost entirely, if not solely, from excessive issues of paper. They detailed the extraordinary increase in the Bank's issues, and that, as Mr. Colville admitted, the rise in the exchange was concomitant with these extended issues. In March, 1797, the paper of the Bank was between £600,000 and £700,000, and exchange in Dublin was 5½ to 6½. In April, 1801, the paper was £2,266,000, and exchange rose to 11½ and 13. In January, 1804, the paper was £2,986,999, and exchange rose to 17 and 18. How far these increased issues from the Bank of Ireland facilitated an increase from private bankers was not clearly proved, but it certainly did so to an immense extent, silver notes and L. O. U.'s, especially, were issued with

the greatest profusion. In 1799 the number of bankers issuing notes was eleven; in 1800, it was twenty-three; in 1801 it was twenty-nine; in 1802 it was thirty; and in 1803, forty; the number of notes paying duty, in the same periods, was, in—

	11d.	3d.	4d.
1799 . .	148,112 . .	198,361 . .	104,248
1800 . .	245,673 . .	147,211 . .	65,201
1801 . .	941,894 . .	196,108 . .	95,600
1802 . .	823,673 . .	204,940 . .	67,594
1803 . .	1,110,217 . .	256,801 . .	90,265

The notes under three guineas requiring a 1½d. stamp; those under £10, a 3d. stamp; and those under £50, a 4d. stamp. These immense issues, along with the profusion of silver notes, and the base and counterfeit coin, kept up the prices of all necessaries and manufactures, drove out of circulation what little good silver had been in it; and above all, kept up a high and unexampled rate of exchange against the kingdom, unwarranted in its height and continuance, by any other great or adequate cause than that depreciation, which such extravagant issues had assisted. The total number of houses that issued tokens and notes, according to the best accounts they could procure, was considerably above 200. Mr. Beresford, a banker in Dublin, estimated that the country issues had increased fourfold since the restriction. The committee enumerated some other causes, which might help to increase the unfavourable rate.

368. The repeal of the Restriction Act, from which all these evils flowed, would undoubtedly be the great and effectual remedy for the high and fluctuating rates of the exchange. The common medium of payment being thereby restored, the rise of exchange above par would be limited to the expense of transporting specie, and paper being convertible into gold, its depreciation would be prevented. The inconveniences, however, to which the Bank of Ireland and other banks would be exposed, if such a measure were suddenly adopted, at the present rate of exchange, was a strong argument against its being done at present. But there was no commercial reason against its being done, as the real exchange was undoubtedly in favour of Ireland. The continuance of the restriction was no doubt connected with political considerations, which the committee could not inquire into.

369. Seeing, then, that the removal of the restriction was not to be expected at that period, it only remained to consider what other remedies might be adopted to cure the evil. One which had been suggested, was the consolidation of the two Banks of England and Ireland, but there did not seem to be any likelihood of effecting this. It had also been suggested, that Bank of Ireland paper might be made convertible into Bank of England paper, either in Dublin or London, or the Bank might give bills of exchange on London for them. These means would certainly have the effect of rectifying the exchange. The Bank of Ireland objected to the difficulty and expense of establishing a fund in London for this purpose. But the argument had no weight, because the expense of this would not be so great as the Bank was subject to before the restriction, in order to maintain the convertibility of its notes, and which they must again incur, when the re-

striction should be removed. Besides, the Scotch banks had done the very same thing with the most complete success. The Scotch currency had never varied from par since they had organized a measure of this sort, even during periods of great discredit, and no restriction had been imposed on them, when it was on the Banks of England and Ireland.

370. The undoubted success of this measure, in the case of the Scotch Banks, was a strong argument that the Bank of Ireland should do the same thing. And there was a stronger argument still why the Bank of Ireland should do it. The Scotch Banks, of their own good sense and patriotism, organised this measure, without a precedent, and provided a fund at their own expense, but the Bank of Ireland had now an opportunity of doing it without any difficulty, risk, or expense. The sums to be remitted during that year from England to Ireland amounted to £5,000,000 Irish. This sum, or a portion of it, might, as several of the witnesses said, be appropriated for this purpose. It might be paid into the Bank of England to the credit of the Bank of Ireland, and though no doubt it would be an expense to that Bank, it would furnish a fund to draw upon, by which it could effectually control the exchange, and the evil of the expense would be temporary, the good would be permanent to the Bank and the public. And the Bank having a monopoly and a charter, were bound to think of the public before their own proprietary. In this case, however, it would be found that the interests of the public and the Bank were the same, as the Bank might make a profit out of their exchange dealings. The committee suggested some other minor remedies of the same nature, as auxiliary to the chief one.

371. But all the benefits derived from these remedies would be of little avail, and of very short duration, if they did not at the same time cure the depreciation of Irish paper, by diminishing its over issue. This consequence must necessarily follow from Bank of Ireland notes being made convertible into Bank of England notes, almost as they would be into gold, if the restriction were to cease. For if their fund in London were too rapidly drawn upon at any time, they must immediately limit their issues to lessen the demand, the notes would become of equal value with the English notes, and therefore with guineas, so long as the English notes were at par. *They did in express terms declare their clear opinion that it was incumbent on the directors of the Bank of Ireland, and their indispensable duty, to limit their paper at all times of an unfavourable exchange, during the continuance of the restriction, exactly on the same principle as they would, and must have done, in case the restriction did not exist; and that all the evils of a high and fluctuating exchange were to be imputed to them, if they failed to do so.* The effect which making Bank of England notes procurable in Ireland would have on the exchange, was clearly shewn by the great fall in it in March, April, and May, 1797, when Government passed Bank of England notes in Dublin. It would also have the beneficial effect of making the transition to a resumption of cash payments more easy, whenever other circumstances permitted that event to take place. Nevertheless this reduction in the

quantity of paper should take place gradually and cautiously.

372. But measures should also be taken to reduce the quantity of the private bankers' and others' paper in circulation. The laws respecting the registry of bankers, and the full payment of stamp duties, which were very generally evaded, should be strictly enforced. It might be advisable to forbid all bankers, except the Bank of Ireland, to issue any notes under ten guineas, and as soon as a proper and sufficient silver currency could be procured, all silver notes should be suppressed.

373. The committee called attention to the miserable state of the Irish small currency, and to the circulation of dollars, stamped to pass as tokens. They recommended that the Irish currency should be equalized with the English, by making the Irish shilling 12d., before any new coinage was struck, and that all distinctive marks between the English and Irish copper coinage should be abolished, and that the English copper coinage should be as current in Ireland as the silver and gold coinage.

374. This admirable report is the first parliamentary investigation into the theory of a paper currency, and is remarkable as the first authoritative declaration that it ought to be governed by the foreign exchanges. In this it fully adopted the truths demonstrated by Mr. Boyd, Lord King, and Mr. Parnell, and is in entire accordance with the more celebrated Bullion Report of 1810. It, however, did not discuss the new theory propounded, that the paper currency should be regulated by the mercantile bills offered for discount. This the bullion committee did, and entirely condemned it.—(BULLION REPORT). No one who has paid any attention to the principles of the subject, and carefully considered the facts produced before the committee, can fail to acquiesce in their judgment; and there is one remarkable circumstance, which we must note, as it occurred again before the bullion committee, that not one of the professional witnesses, i. e., the directors of the Bank of Ireland, or the private bankers examined, had attained the smallest glimpse of the principles which governed their own business, and by which they should have directed their policy. Its true principles were clearly seen and announced, solely by the extra-professional witnesses, and laid down by the statesmen who formed the committee.

375. The presentation of this report does not seem to have excited any discussion in the House till many years afterwards; but it seems to have produced a temporary effect on the policy of the bank, for in May, June, and July, 1804, the directors reduced their issue by half a million, and the exchange fell. They increased them again in August, and the exchange rose. In November, 1804, a large loan for Ireland was negotiated in England. This was done by sending over £200,000 of Bank of England post bills to Dublin, and selling them there; they were first advertised at 11½, but only £170,000 were subscribed. They were then reduced to 10, but that did not increase the bidders. They were then obliged to sell them at par, 8½, in order to procure the sums necessary for the public service. These caused the exchange to fluctuate between par and 10 or 11. The Chancellor of the Exchequer (Addington) said that it was a perversion of terms to infer that the depre-

ciation of paper had any real effect on the exchange. He allowed that the excessive issue of paper produced a depreciation. The fact was that in each country there was a different circulating medium, and the depreciation of either could only have a nominal effect on the course of exchange. Mr. Fox was glad to hear that the Chancellor of the Exchequer allowed that an excessive issue caused a depreciation, and that the House was never again to hear the fantastical opinion that paper was not depreciated, but the value of gold raised, as well as that these evils proceeded exclusively from the restriction on the bank. Mr. Fox's exultation was premature. Had he but lived six years longer, he would have found that this fantastical opinion not only reappeared, but was maintained with greater stubbornness and pertinacity than ever, and that too by some of the very statesmen who framed the Irish report. In 1805 the small notes under £1 were abolished, in accordance with the recommendation of the committee. In 1808, by the Act, Statute 1808, c. 103, the capital of the bank was raised from £1,500,000 to £2,000,000. In 1809, Mr. Parnell brought a motion forward in the House of Commons, to assimilate the currency of Ireland to that of England, in accordance with the recommendation of the committee, but it was negatived without a division. The exchange at that time was actually in favor of Dublin, as the Bank of England was now entering on that wild career of excessive issues, which produced the derangement of the English exchanges, which gave rise to the bullion report. During the year 1804, the exchange at Dublin on London gradually diminished from 17, at which it was in March, to 11½ at the end of the year, at which it continued with no remarkable fluctuation for about two years. At the beginning of 1808 it stood about 9½, and then gradually rose in 1809, the Bank of England then extending her issues, and in 1810, at the time of the bullion report, it stood at 8½, the Bank of England note itself being depreciated about 15 per cent. at that time. Mr. Coningham, a London merchant, who was examined before the committee of 1804, and who was of opinion at that time that the Irish paper currency was depreciated, when examined before the bullion committee in 1810, said that the Irish currency had not altered its value, compared to the currency of continental countries, since 1804. In 1812, Lord Stanhope's Act, declaring it a misdemeanour to make a difference in payments between guineas and bank notes, was extended to Ireland, in respect to the Bank of Ireland notes.

376. The Act made in the Irish Parliament in 1797, for confirming and continuing the order in council for restraining cash payments, was continued by the Act, Statute 1802, c. 45; it was further continued by the Act, Statute 1803, c. 44; further continued by the Acts, Statutes 1804, c. 21; 1814, c. 130; 1815, c. 41; 1816, c. 48; and 1818, c. 60. These enacted that the restrictions on the Bank of Ireland should continue for three months after the Bank of England had resumed cash payments. By the Act, Statute 1819, c. 24, the Bank of Ireland was forbidden to cash any notes in terms of the notices which it had given of resuming payments *pari passu* with the Bank of England. And by the same Statute, c. 99, it was enacted that between the 5th April and the 1st November, 1820, the bank should be obliged, on

any one presenting notes to an amount not less than of the value of 60 oz. of gold, calculated at the value of £4 1s. per ounce British, to pay the same in standard gold. Between the 1st November, 1820, and the 1st June, 1821, the same amount of notes was to be paid on demand in gold, at £3 19s. 6d. per ounce; and between the 1st June, 1821, and the 1st June, 1823, the rate was to be at £3 17s. 10½d. per ounce. During the first mentioned period, it might make payments at any rate between £4 1s. and £3 19s. 6d.; during the second, at any rate between £3 19s. 6d. and £3 17 10½d., upon giving three days' notice in the *Dublin Gazette*; and after they had once lowered them, they were not to raise them again. These amounts could only be demanded in ingots, or bars of 60 ounces each. After the 1st June, 1822, the bank might resume payments in coin.

377. In 1821, by the Act, Statute 1821, c. 27, the Bank was allowed to resume payments in cash on the 1st of June of that year, if they chose. No person who was offered payment in coin could demand ingots. But those who were not offered ingots, might demand coin.

378. In 1818 and 1819, which we have already shewn, was a period of monetary derangement in England; there was a general convulsion in Ireland, especially in the South. Nearly every banker in the three southern provinces failed. It was then at last determined to break up the monopoly of the Bank of Ireland, to a certain extent, to encourage the formation of banks more on the Scotch plan of having a very large number of partners. By the Act, Statute 1821, c. 72, the Bank of Ireland was authorised to advance to Government the sum of £500,000 Irish currency, at 4 per cent., for 17 years, to be repaid on the 1st January, 1838. The Bank was allowed to increase its capital from £2,500,000 Irish, at which it then stood, to £3,000,000 Irish. The notes of the Bank of Ireland were also ordered to be received in payment of all sums to the public revenue. It was also enacted that any partnership in Ireland, exceeding six persons, and having their houses of business at any place not less than fifty Irish miles from London, might borrow, owe, or take up any sum or sums of money on their bills, or notes, payable on demand, and make, and issue such notes, at any place more than fifty miles from Dublin. Every member of such a partnership should be liable to the full extent of his means for the payment of these notes. But such partnership were not to have any other privilege, or power conferred upon them, until the 1st of January, 1838, nor until the repayment to the Bank of Ireland of all sums due to it by the government. As fifty Irish miles were equal to sixty-five English ones, this Act confined the monopoly of the Bank to that limit.

379. The very narrow opening which was effected in the monopoly of the Bank of Ireland, by the Act just mentioned, produced no good. All sorts of doubts and legal objections were taken to it, and it was even maintained, and successfully too, that every partner in an Irish joint stock bank must be resident in Ireland. This of course precluded any such plan as having a head office in London with branches in the provinces of Ireland. Thus all English capital was at once excluded from banking in Ireland. By the Act, Statute 1824, c. 73, further facilities were given,

some institutions were commenced, but the Act being insufficient for its purpose, it was repealed by the Act, Statute 1825, c. 42, which was the model, upon which the Joint Stock Banking Act was framed in the following year. By this Act—

I. Any persons exceeding six in number, and not having any house of business within fifty (Irish, i.e. sixty-five English) miles from Dublin may borrow, owe, or take up any sum, or sums of money, on their bills, or notes, at any place in Ireland, beyond the prescribed limit, each member being fully responsible for the payment of all such bills and notes.

II. No such partnership could by themselves, or their agents, pay, issue, or re-issue, within the same limits any of the company's bills, or notes payable on demand, or any bank post bill, or draw upon any agent, within that limit, any Bill of Exchange payable on demand, or for less than £50. Nor were they to issue any such Bills in England, or Dublin, or within fifty miles of it, payable on demand, or at any less time than six months.

III. Any person residing in Great Britain, or Ireland, might subscribe to such a partnership.

IV. Every such banking partnership was to deliver and register at the Stamp office in Dublin, an account of the names of its partners, and of two of them resident in Ireland, who were called the public officers of the company, in whose name they might sue and be sued; and a variety of other particulars.

A number of enactments were also made for the purpose of facilitating legal proceedings by and against such partnerships. By chap. 98 of the same Statute, the Bank of Ireland was forbidden to circulate any more of the tokens, which it had issued in 1804, to supply a better currency than was then in existence. These tokens were not to be current after the 5th January, 1826; and £500,000 was voted out of the consolidated fund, to withdraw them from circulation.

360. A very important Act was also passed in the same year; for, by chapter 79, provision was made to carry out the recommendation of the committee of 1804, that the currencies of Great Britain and Ireland should be assimilated. The Act was to commence on the 5th January, 1826, and after that date the currency of Great Britain was to be the currency of the United Kingdom, and all contracts of every sort and description were to be made in that currency alone. All Irish contracts, and obligations in Irish currency, made before the commencement of the Act, were to be carried into effect, and satisfied by British currency, of the amount of 12-13ths according to Irish currency. Provision was made for cases in which any amount of currency in one came to a fractional part of a penny, or a shilling, in the other. On a given day, to be determined by proclamation, the Irish copper coinage was to be called in, and the British copper coinage substituted. All notes of bankers were in future to be in British currency.

381. The first bank which was formed under the new law, was the Provincial Bank of Ireland. This was begun at the end of 1824, and opened its first branch at Cork in September, 1825. A considerable amount of jealousy was displayed towards it by the Bank of Ireland. The Provincial made its notes payable at its Dublin agents,

and the Bank of Ireland brought an action against them for an infringement of their charter, in 1828, which was decided in their favor. The Provincial Bank presented a £100 note of the Bank of Ireland, at one of its branches, and demanded gold for it, the agent declined to pay it as he had no orders to do so. Upon this the Provincial Bank protested the note for non-payment, but it was held that the Bank of Ireland was not bound to pay its notes in gold, except in Dublin. By the Act, Statute 1828, c. 81, all banks must pay their notes at the place of issue.

382. By the Act, Statute 1824, c. 159 (local and personal), a company was established called the Hibernian Joint Stock Company, or the Hibernian Bank, for the purpose of purchasing and selling annuities, and all public and other securities, real and personal, in Ireland, and to advance money, and make loans, on real and personal security, at legal interest, and on the security of merchandize, and manufactured goods, and it might sue and be sued in the name of the governor, or secretary for the time being. This bank, something of the nature of the Million Bank, is established in Dublin; it does not issue notes, but has acted as agent to some of the country banks.

383. The strong political feeling, which has done so much to retard the advancement of Ireland, vented itself repeatedly in runs upon the banks, especially on the Provincial. These took place in 1828, twice in 1830, 1831, 1833, 1836, 1856, and 1857. The way in which this bank, as well as the other establishments in Ireland have withstood these, proves their solidity, and good management, and is a striking contrast to the wretched system that prevailed before their institution. There have undoubtedly been some failures, as, for instance, the Agricultural and Commercial Bank, which was one of the largest in Ireland, stopped in 1836, after having been in operation little more than two years, and was dissolved a few years afterwards. But there can be little doubt that a solid banking system has been at length founded in that country, and that it will in due time bear its usual fruits in the civilization and improvement of the country.

384. Simultaneously with his Act to regulate the issue of Bank Notes in Scotland, Sir Robert Peel passed an Act for a similar purpose regarding Ireland. The chief provisions of this Act, Statute 1845, c. 37, are as follows.—

I. From and after the 6th day of December, 1845, the clauses in the Bank of Ireland Act, prohibiting banking partnerships from being formed with more than six partners, were repealed. And on and after that day banking partnerships may be founded of any number of persons, and carry on business in Dublin, and within fifty miles of it, as freely as they may beyond that limit, provided all the members are liable for all the debts of the partnerships.

II. The capital of the Bank of Ireland lent to Government, amounting to £2,637,769 4s. 8d., was made chargeable on the consolidated fund of the United Kingdom, subject to redemption. And an annuity of £92,076 18s. 5d. should be paid to the Bank, being interest at 3½ per cent.

III. The Bank was to manage the public debt of Ireland, and pay all the dividends, &c., without any remuneration.

IV. The corporation may be dissolved at any

time upon twelve months' notice to be given after the 1st January, 1855.

V. The clause in the Statute 1759 (the Bankers' Act), prohibiting public officers from being partners in banks, was repealed.

VI. Bank of England notes might circulate in Ireland, but were not to be legal tender there.

VII. All bankers, claiming to issue notes, were to give notice, within a month after the passing of the Act, to the Commissioners of Stamps and Taxes in London, who were to ascertain the average amount of notes which the banker had in circulation during the year preceding the 1st May, 1845, and it should be lawful for the banker to issue from the 6th of December, 1845, such average of notes, together with notes to the amount of gold and silver coin held by him. And after the 6th of December, 1845, no person was to commence issuing notes.

VIII. If any banks had become united during the year mentioned, the commissioners might ascertain the average issued by each banker, and the united bank might issue an amount equal to the average of each separate one.

IX. If two or more banks unite after the passing of the Act, the united bank may issue to the amount of the separate banks, together with the monthly average of the gold and silver coin held by them.

X. Banks, which possessed the privilege of issuing notes, might contract with the Bank of Ireland to issue its paper instead of their own, but after they had once discontinued their privilege of issue, they were not to resume it.

XI. After the 6th December, 1845, no banker was to have in circulation, upon an average period of four weeks, a greater amount of notes than his authorised issue, together with the average amount of gold and silver coin held by him during the same four weeks.

XII. All bank notes after the 6th December, 1845, were to be for a certain number of pounds sterling, without any fractional parts of a pound, with a penalty of £20 for every breach.

XIII. All bankers issuing notes after the 6th December, 1845, were to transmit weekly accounts to the Commissioners of Stamps and Taxes, shewing the number of notes they had in circulation the preceding Saturday at the close of business, distinguishing the notes of £5 and upwards, and those below £5, and also a daily account of the gold and silver coin held by them, at each of the places of issue in Ireland, and all other calculations, necessary to verify the amount of his circulation during each period of four weeks.

XIV. The amount of silver coin, upon which notes might be issued, was not to exceed one-fourth part of the gold. And if any banker issued in excess of his authorised issue, he was to forfeit the excess.

XV. After the 1st of January, 1846, no notes, bills, drafts, or undertakings in writing, were to be made, issued, or negotiated in Ireland, for any less sum than twenty shillings, under a penalty of not less than £5, or more than £20, for each offence.

XVI. All promissory notes, bills, drafts, or undertakings in writing, being negotiable or transferable, for the payment of 20s., or any sum above that and under £5, or any similar instrument, upon which a similar sum remains undis-

charged, and which should be issued in Ireland after the 1st January, 1846, shall specify the names and places of abode of the persons respectively, to whom, or to whose order the same shall be payable, and shall bear date before, or at the time of drawing, or issuing thereof, and not any day after it, and shall be made payable within the space of twenty-one days, next after the date thereof, and shall not be transferable or negotiable after that date. Every indorsement upon it shall be made before that date, and must bear date at, or not before, the making of it; and must state the name and abode of the person, to whom, or to whose order the money contained in such instrument is to be paid. All signatures and indorsements must be attested by one witness at least. Forms of such instruments are given. And all instruments drawn and issued contrary to this clause were to be absolutely void.

XVII. If anybody politic, or corporate, or any person, after the 1st of January, 1846, should make, sign, issue, or re-issue, in Ireland, any promissory note, payable on demand to the bearer thereof, for any sum of money less than £5, except the bankers authorized to do so, such person, or body, should forfeit the sum of £20 for each note so made, signed, issued, or re-issued.

XVIII. A similar penalty on any body politic, or corporate, or person, who should, after the passing of the Act, publish, utter, or negotiate in Ireland, any promissory or other note, (not being the bank note of a banker authorized to issue such notes), or any bill, draft, or undertaking in writing, negotiable or transferable, for the payment of 20s., or less than £5, or on which a similar sum remained undischarged.

XIX. Provided that nothing should extend to prevent any person drawing a cheque on his banker for such a sum.

XX. After this Act, all companies of bankers in Dublin, and within fifty miles of it, shall have the same powers and privileges of suing and being sued, and other legal privileges, as were enjoyed by the companies established beyond that limit.

386. Since the passing of this Act, no events of a remarkable character have occurred, except the failure of the Tipperary Bank in 1856, which caused a severe run on the other banks in the rural districts of the South of Ireland, but it was well met by them, and no other disaster occurred. In 1857, the panic caused by the failure of the Western Bank of Scotland, and two very large English banks, caused a general run upon all the Irish banks, more or less. The Bank of Ireland advanced £250,000 to the other banks, but that was not sufficient, and they were obliged to send over £1,200,000 from England, but no failure took place. At the present time, there are five joint stock banks in Ireland, besides the Bank of Ireland, which issue notes, and two which do not.

Some considerations on the two grand staple commodities of England, and on certain establishments, wherein the public good is very much concerned. Humbly presented to the Parliament. By Sir Balthazar Gerbier. Knight. London. 1651.

This is the earliest tract we have been able to discover, recommending the establishment of bank in England. (GERBIER.)

Seasonable observations ; humbly offered to His Highness the Lord Protector. By Samuel Lambe, of London, merchant. 1658.

This tract, except the one quoted above, is the earliest we have been able to discover, which advocates the establishment of banks in England. It sets forth the great advantages which the Dutch derived from their banks, in respect of their stock, which was *increased* by banks. The benefits attributed by the author to the banks in Holland were:—"1. They have raised themselves from poor, distressed, to high and mighty states. 2. They have increased the general stock of their country so much, that they can, when they please, ingross the particular commodity of one country, and sell it again at their own price, in the same, or another, that wants it. 3. They maintained wars many years with the King of Spain, and hired foreign soldiers to save their own people in that war and received in ready money (with which they paid their armies), the proceeds of their utensils of war, and other commodities they sold to their enemies, which they bought with *imaginary money* in Banks, and so furnished the Spaniard with those things he wanted, for their own profit, which otherwise they knew another nation would else have done. 4. They have increased their trade, and thereby grown so rich and strong in shipping and mariners, that they have forced the King of Spain to a peace with them. 5. To make their own terms with the King of Denmark. 6. To hold the King of France to such conditions as have not always pleased him. 7. To make war with the English at sea, to whom they there always yielded, and acknowledged obedience and submission. 8. To rule over many petty kings and principalities in the East Indies, and other places, where they have power to overcome them. By the help of banks they so much augment their stocks, that they set out so many hundred of busses, and other fishing boats, yearly, to catch herring and codfish in our seas, with which they serve all Christendom, to their incredible gains, and formerly our own nation, to our great loss, decay of our fishery." He then sets forth, with great minuteness, the advantages which the English would derive from them.

He then explains the nature and constitution of a bank, and it well deserves the reader's attention, because it exactly coincides with what we have shewn to be the meaning and function of a "bank," in the preceding sections. Lambe says, "A bank is a certain number of sufficient men of estates and credit *joined together* in JOINT STOCK, being as it were, the general cashkeepers or treasurers, of that place where they are settled; letting out *IMAGINARY MONEY* at interest at £2½ or £3 per cent. to tradesmen, or others, that agree with them for the same, and making payment thereof by assignation, and passing each man's account from one to another, with much facility and ease, and saving much trouble in receiving and paying money." Appended to this tract, Lambe added proposals for establishing a bank at London. He says, "Most men will desire to have money there, *that they may have credit in bank, two or three times the value thereof*, for he will not see to be of any estate or worth, that hath not some money in bank, to procure credit there without trouble against he have occasion for it." And among other functions this bank was to perform

was, "That they let out *imaginary money* or credit upon ticket at £2½ and £3 per cent. at the most."

This tract is extremely important, because the writer, who was a merchant, thoroughly understood that banks *increase* capital, and he saw too, exactly what we have shewn to be the case in the preceding section, that *banking consists in the creation of credit*—quite contrary to the great misconception of its nature and effects, which is universally prevalent at the present day.

A Reply to the Defence of the Bank; setting forth the unreasonableness of their slow payments, &c. By a True Lover of his Country and the present Government. London, November 16, 1696.

This contains several curious details of the method of payment by the bank during its partial suspension, and of the speculation that went on in its notes. The author saw, too, what we have called Gresham's law of the currency. He lays it down as a general maxim, "When two sorts of coin are current in the same nation of like value by denomination, but not intrinsically, that which has the least value will be current, and the other (as much as possible) will be hoarded." It is an able pamphlet.

An Appeal to the People of England, the Public Companies, and Monied Interest, on the Renewal of the Charter of the Bank. London, 1742.

Charter of the British Linen Company. Edinburgh, 1746.

This is the charter incorporating the British Linen Company, with a clause granting powers of banking. In pursuance of this clause the company has developed itself into one of the most powerful and wealthy of the Scotch banks. We have mentioned in section 301, that a question has recently been raised, as to whether the three chartered banks in Scotland enjoy the privilege of limited liability. It was universally supposed, until very recently, that they did. The point has been raised within the last few years, and it is quite clear from the words of the charter, that the *British Linen Company does not enjoy limited liability, but is a bank with UNLIMITED LIABILITY.* The charter says, "We will, moreover, and by these presents for us, our heirs, and successors, do grant to the said corporation, That in order to answer ALL JUST DEMANDS on the said corporation, the general court shall have power from time to time, as they shall see cause, to call in, or direct to be paid, from their respective members for the time being, proportionally, according to their respective shares, in the capital stock of the said corporation, any sum of money, as by such general courts shall be from time to time adjudged necessary to be called in, or raised for the exigencies of the said corporation, to be paid into such hands, as they shall appoint for that purpose, so as such call do not at any one time exceed ten pounds for every hundred on the capital, and so as there be an interval of thirty days at least, between every such call." It is quite clear that these words render every member of the corporation liable to contribute to the payment of all its debts, in proportion to his stock.

Considerations relating to the two banks established in Edinburgh. 1762.

Remarks on the proposed plan for regulating the paper currency of Scotland. London, 1765.

Precipitation and fall of Messrs. Douglas, Heron and Co., late bankers, Ayr. Edinburgh, 1778.

Banking; its Utility and Economy. By Thompson Hankey, Esq. London, 1859.

Historical Sketch of the Rise and Progress of Banking in the United States of America.

386. We shall now cross the Atlantic, and trace the rise and progress of banking and paper currency in the country most nearly connected with us by blood and commercial relations, and in which it arose almost contemporaneously with England. There is no country in which the phenomena of paper money may be studied with greater advantage than in the United States of America, where it has become a kind of hereditary disease. There is no country in which it has undergone such a long-continued and inveterate depreciation. The history of banking and paper currency in the United States may be divided into four periods:—

I. The era of *Provincial* paper, in which each province did that which was right in its own eyes, issued paper money *ad libitum*, and declared it legal tender. This was brought to an end by an Act of the Imperial Parliament in 1763, putting down this legal tender paper.

II. The era of *Continental* paper, or the paper issued by the National Government during the War of Independence.

III. The era of a National Bank, which, with some interruptions, endured from 1782 to 1836.

IV. The era of the abolition of a National Bank since 1836.

387. We are fortunate in possessing a history of Massachusetts, by Mr. Hutchinson, the lieutenant-governor of the province, who, when speaker of the House, devised and carried the bill for the abolition of the paper money. In his history we have a full account of the paper currency which afflicted it so long. We shall present our readers with a series of extracts from it, showing how admirably the writer had seized the true principles of a paper currency, and how clearly and firmly he saw the great truths which were only established in England after the most protracted conflicts. The following passages from this writer exhibit a brilliant contrast to the pitiable figure made by the ministry, the bank directors, and the mercantile witnesses of

England, in the great currency discussions from 1804 to 1819, and even to a later period. It will be seen that the great truths, established with such arduous labour by the Irish Committee of 1804, the Bullion Committee of 1810, and the Committee of 1819, and for which our English economists have obtained so much credit, were perfectly well known to this admirable writer in 1747.

388. The Stuart dynasty had afflicted the colonies with the same grievances as England. The charter of Massachusetts had been forfeited, like so many in this country. The sturdy colonists were animated with the same hatred of the French, and their tyrants, as their kinsmen in the mother country. The revolution of 1688 was, therefore, hailed with the same enthusiasm on both sides of the Atlantic. New England burned for the conquest of New France. No sooner, therefore, was war declared between the parent countries, than the colonists prepared for a similar contest. The French Canadians attacked the English settlements, and the New Englanders determined to undertake the conquest of Acadia and Canada. In May, 1690, the first Congress in the New World was held under the presidency of Massachusetts. Expeditions against both the French settlements were fitted out. That against Acadia succeeded, there being merely a handful of settlers there. But the much greater expedition against Canada, directed simultaneously against Montreal and Quebec, failed completely. We now quote from Mr. Hutchinson, the historian of Massachusetts.

389. "The Government was utterly unprepared for the return of the forces. They seem to have presumed not only upon success, but upon the enemy's treasure to bear the charge of the expedition. The soldiers were on the point of mutiny for want of their wages. It was utterly impracticable to raise in a few days, such a sum of money as would be necessary. An Act was passed for levying the sum, but the men could not stay until it should be brought into the treasury. The extreme difficulty to which the Government was thus reduced, was the occasion of the first bills of credit ever issued in the colonies, as a substitute in the place of money. The debt was paid by paper notes, from two shillings to ten pounds denomination, which notes were to be received for payment of the tax, which was to be levied, and all other payments in the treasury. This was a new experiment. They had better credit than King James's leather-money in Ireland about the same time. But the notes would not command money, nor any commodities at money price. Sir William Phipps, it is said, exchanged a large sum at par, in order to give them credit. The soldiers in general were great sufferers, and could get no more than 12s. or 14s. in the pound. As the time of payment of the tax approached, the credit of the notes was raised, and the Government allowing five per cent. to those who paid their taxes in notes, they became better than money. This was a gain to the possessor, but it did not restore to the poor soldier what he had lost by the discount.

"The Government, encouraged by the restoration of credit to their bills, afterwards issued others for charges of Government. They

obtained good credit at the time of their being issued. The charges of Government were paid in this manner from year to year. Whilst the sum was small, silver continued the measure, and bills continued their value. When the charges of Government increased, after the second expedition to Canada, in 1711, the bills likewise increased, *and in the same, or greater proportion, the silver and gold were sent out of the country.* There being a cry of scarcity of money in 1714, the Government caused £50,000 to be issued, and in 1716, £100,000, and lent to the inhabitants, to be paid in at a certain time; and, in the meantime, to pass as money. Lands were mortgaged for security. As soon as the silver and gold were gone, and the bills were the sole instruments of commerce, pounds, and shillings, and pence, were altogether ideal, for no possible reason could be assigned why a bill of 20s. should bear a certain proportion to any one quantity of silver, more than another. Sums in bills were drawing into the treasury from time to time by the taxes, or payment of the loans, but then other sums were continually issuing out, and all the bills were paid and received, without any distinction, either in public, or private payments, so that, for near forty years together, the currency was in much the same state as if £100,000 sterling had been stamped in pieces of leather, or paper of various denominations, and declared to be the money of the government, without any further sanction than this, that, when there should be taxes to pay, the treasury would receive this sort of money, and that every creditor should be obliged to receive it from his debtor. Can it be supposed that such a medium would retain its value? In 1702, 6s. 8d. was equal to an ounce of silver. In 1749, 50s. was judged equal to an ounce of silver. I saw a 5s. bill which had been issued in 1690, and was remaining in 1749, and was then equal to 8d. only in lawful money, and so retained but about one-eighth of its original value. Such was the delusion, that not only the bills of the Massachusetts government passed as money, but they received the bills of the government of Connecticut, New Hampshire, and Rhode Island, also as currency. The Massachusetts bills passed also in those governments."

390. "The affair of the war," says the same historian, vol. ii., p. 206, "had so engaged the attention of all persons, that we hear little of party disputes, and discord, for five or six years past; but as soon as they were delivered from enemies without, a contention began within, from a new cause, the effects of which were felt many years together. The paper bills of credit were the cause of this contention. So many bills had been issued for the charges of the war, particularly the large sum of £40,000, issued for the Canada expedition, that they were become the sole instrument and measure of commerce, and silver and gold were entirely banished. Of two instruments, one in use in a particular state only, the other with the whole commercial world, it is easy to determine which must leave that particular state, and which remain. The currency of silver and gold entirely ceasing, the price of everything bought or sold was no longer compared therewith, but with the paper bills, or rather with mere ideal pounds, shillings, and pence. *The rise of exchange*

with England was not attributed to the true cause, the want of a fixed staple medium, but to the general bad state of the trade. It was thought that increasing the paper bills would enliven and reform the trade. Three parties were formed, one very small, which was for drawing in the paper bills, and depending upon a silver and gold currency. Mr. Hutchinson, one of the members for Boston, was among the most active of this party. He was an enemy all his life to a depreciating currency, upon a principle very ancient, but too seldom practised upon, *nil utile quod non honestum*.

"Another party was very numerous. These had projected a private bank, or rather had taken up a project published in London in 1684; but this not being generally known in America, a merchant in Boston was the reputed father of it. There was nothing more in it than issuing bills of credit, which all the members of the company promised to receive as money, but at no certain value, compared with silver and gold; and real estates to a sufficient value, were to be bound as a security that the company should perform their engagements. They were soliciting the sanction of the general court, and an act of government to incorporate them. This party generally consisted of persons in difficult, or involved circumstances in trade, or such as were possessed of real estates, but had little or no ready money at command, or men of no substance at all, and we may well enough suppose the party to be very numerous. Some, no doubt, joined them from mistaken principles, and an apprehension that it was a scheme beneficial to the public, and some for party sake, and popular applause.

"Three of the representatives of Boston, Mr. Cooke, son to the agent, Mr. Noyes, a gentleman in great esteem with the inhabitants in general, and Mr. Payne were the supporters of the party. Mr. Hutchinson, the other (an attempt to leave him out of the house not succeeding), was sent from the house to the council, where his opposition would be of less consequence. The governor was no favorer of the scheme, but the lieutenant-governor, a gentleman of no great fortune, and whose stipend from the government was trifling, engaged in this cause with great zeal.

"A third party, though very opposite to the private bank, yet were no enemies to bills of credit. They were in favor of a loan of bills from the government to any of the inhabitants who would mortgage their estates as a security for the repayment of the bills, with interest, in a term of years, the interest to be paid annually, and applied to the support of government. This was an easy way of paying public charges, which no doubt they wondered, that in so many ages, the wisdom of other governments had never discovered. The principal men in the council were in favor of it, and it being thought by the first party, the least of two evils, they fell in with the scheme, and after that the country was divided between the public and private bank. The house of representatives was near equally divided, but rather favorers of the private bank, from the great influence of the Boston members in the house, and a great number of persons of the town out of it. The controversy had a universal spread, and divided towns, parishes, and particular families.

"At length after a long struggle, the party for the public bank prevailed in the general court, for a loan of £50,000 in bills of credit, which were put into the hands of trustees, and lent for five years only, to any of the inhabitants, at 5 per cent. interest; one-fifth part of the principal to be paid annually. This lessened the number of the party for the private bank, but it increased the zeal, and raised a strong resentment in those which remained.

391. "In 1720," continues the historian, p. 231, "the trade of the province declined. There was a general cry for want of money, and yet the bills of credit, which were the only money, were daily depreciating. The depreciation was grievous to all creditors, but particularly distressing to the clergy, and other salary men, to widows and orphans, whose estates consisted of money at interest, perhaps just enough to support them, and being reduced to one-half the former value, they found themselves on a sudden in a state of poverty and want. Executors and administrators, and all who were possessed of the effects of others in trust, had a strong temptation to retain them. *The influence a bad currency has upon the morals of the people is greater than is imagined.* Numbers of schemes for private, and public, emissions of bills were proposed as remedies, *the only effectual one, THE UTTER ABOLITION OF THE BILLS was omitted.*"

In this year £50,000 had been issued and distributed to the several towns in proportion to their taxes, the bills to be repaid at a fixed time, and the governor seemed to approve of and encourage this way of issuing bills at his first arrival, but was afterwards convinced of their mischievous effects.

"At the opening of the next session, March 15, 1721, the governor in his speech, recommended measures to prevent the depreciation of the currency, to suppress a trade carried on with the French at Cape Breton, and to punish the authors of factious and seditious papers, to provide a present for the five nations, and to enlarge his salary.

"They refused directly or virtually, every proposal. To the first the house tell him in their answer 'they had passed a Bill for issuing £100,000 more in bills of credit.' This alone had a direct tendency to increase the mischief, but they add that to prevent their depreciation, they had prohibited the buying, selling, and bartering silver at any higher rates than set by act of parliament. This certainly could have no tendency to lessen it. Such an act can no more be executed, than an act to stop the ebbing and flowing of the sea. *It would probably carry away and keep out all silver and gold. The DEPRECIATION of their currency, would, notwithstanding, HAVE BEEN AS VISIBLE BY THE RISE OF EXCHANGE WITH FOREIGN COUNTRIES, and have been as sensibly felt by every creditor among themselves.*

"In 1733, there was a general complaint throughout the four governments of New England, of the unusual scarcity of money. There was as large a sum current in bills of credit as ever, but the bills having depreciated they answered the purposes of money so much less in proportion. The Massachusetts and New Hampshire were clogged with royal instructions. It

was owing to them, that those governments had not issued bills to as great an amount as Rhode Island. Connecticut, though under no restraint, yet consisting of more husbandmen, and fewer traders than the rest, did not so much feel the want of money. The Massachusetts people were dissatisfied that Rhode Island should send their bills among them, and take away their substance, and employ it in trade, and many people wished to see the bills of each government current within the limits of such government only. In the midst of this discontent, Rhode Island passed an act for issuing £100,000 upon loan, for, I think, twenty years, to their own inhabitants, who would immediately have it in their power to add £100,000 to their trading stock from the horses, sheep, lumber, fish, &c., of the Massachusetts inhabitants. The merchants of Boston, therefore, confederated and mutually promised not to receive any bills of the new emission, but to provide a currency, a large number formed themselves into a company, entered into covenants, chose directors, &c., and issued £110,000 redeemable in ten years in silver, at 19s. the ounce, the then current rate, or gold in proportion, a tenth part annually. About the same time the Massachusetts treasury, which had been long shut, was opened, and the debts of two or three years were all paid at one time in bills of credit; to this was added the ordinary emissions of bills from New Hampshire, and Connecticut, and some of the Boston merchants, tempted by an opportunity of selling their English goods, having broke through their engagements, and received the Rhode Island bills, all the rest soon followed the example. All these emissions made a flow of money; *silver rose from 19s. to 27s. the ounce, and exchange with all other countries consequently rose also*, and every creditor was defrauded of about one-third of his just dues. *As soon as silver rose to 27s., the notes issued by the merchants payable at 19s. were hoarded up, and no longer answered the purposes of money.* Although the currency was lessened by taking away the notes, yet what remained never increased in value, silver continuing several years about the same rate, until it took another large jump. Thus very great injustice was caused by this wretched paper currency, and no relief of any sort obtained; for by this sinking in value, though the nominal sum was higher than it had ever been before, yet the currency would produce no more sterling money than it would have done before the late emission were made."

392. The same historian continues, p. 392, *sub anno* 1738, "Towards the end of the year, a great clamor arose against the governor for adhering to his instruction about paper money, and against the three representatives for their pernicious principles upon the subject of paper money, and at the town election for 1739, three others were chosen in their stead, two of them professedly disaffected to the governor and promoters of popular measures, the third, though of great integrity, and for that reason desirous of a fixed currency, yet in his judgment against reducing the paper money, and a favourer of schemes for preventing its depreciation. Many country towns followed the example of Boston, and it appeared that a majority of the House were of the same principles with the town members. After Mr.

Belcher's arrival, the House, as we have observed, had passed a vote for depositing £500 sterling in the Bank of England, to be used as they, or their successors, should think proper. This was concurred in council, and consented to by the governor. This money, it was said, could not be better applied, than in soliciting a relaxation of the governor's instruction against paper money, and Mr. Kilby, one of the Boston representatives, was chosen agent for the House, and a petition was by him presented from the House to his Majesty in Council, but it had no effect.

"A general dread of drawing in all the paper money, without a substitution of any other instrument of trade in the place of it, disposed a great part of the province to favour what was called the land bank, a manufactory scheme, which was begun, or rather revived, in this year, 1739, and produced such great and lasting mischief, that a particular relation of the rise, progress, and overthrow of it may be of use to discourage and prevent any attempts of the like nature in future ages. By a strange conduct in the general court, they had been issuing bills of credit for eight or ten years, annually, for charges of Government, and being willing to each present year, they had put off the redemption of the bills as far as they could, but the governor being restrained by his instruction from going beyond the year 1741, that year was unreasonably loaded with thirty or forty thousand pounds sterling taxes, which, according to the general opinion of the people, it was impossible to levy, not only on account of the large sum, but because all the bills in the province were but just sufficient to pay it, and there was very little silver or gold, which by an act of government was allowed to be paid for taxes, as equivalent to the bills. A scheme was laid before the general court by the author of this history, then one of the representatives of Boston, in which it was proposed to borrow in England upon interest, and to import into the province, a sum in silver equal to all the bills then extant, and therewith to redeem them from possessors, and furnish a currency for the inhabitants, and to repay the silver at distant periods, which would render the burden of taxes tolerable by an equal division on a number of a future years, and would prevent the distress of trade by the loss of the only instrument, the bills of credit, without another provided in its place. But this proposal was rejected. One great frailty of human nature—an inability, or indisposition, to compare a distant, though certain, inconvenience, with a present convenience or delight, is said by some strangers, who come among us from Europe, to be prevalent in Americans, so as to make it one of their distinguishing characteristics. Be that as it may, it is certain that, at this time, a great number of private persons, alleging that the preceding general court, having suffered the province to be brought into distress, from which it was not in the power of their successors to afford relief, the royal instruction being a bar to any future emissions of bills, until all that were then extant should be redeemed, resolved to interpose. Royal instructions were no bar to the proceedings of private persons. The project of a bank in the year 1714 was revived. The projector of that bank now put himself at the head of seven or eight

hundred persons, some few of rank and good estate, but generally of low condition among the plebeians, and of small estate, and many of them perhaps insolvent. This notable company were to give credit to £150,000 lawful money, to be issued in bills, each person being to mortgage a real estate, in proportion to the sums he subscribed and took out, or to give bond with two sureties, but personal security was not to be taken for more than £100 from any one person. Ten directors and a treasurer were to be chosen by the Company. Every subscriber, or partner, was to pay 3 per cent. interest for the sum taken out, and 5 per cent. of the principal, and he that did not pay bills might pay the produce and manufacture of the province at such rates as the directors from time to time should set, and they should commonly pass in lawful money. The pretence was that, by thus furnishing a medium and instrument of trade, not only the inhabitants in general would be better able to procure the province bills of credit for their taxes, but trade, foreign and inland, would revive and flourish. The fate of the project was thought to depend upon the opinion which the general court should form of it. It was necessary, therefore, to have a house of representatives well disposed. Besides the 800 persons, subscribers, the needy part of the province in general favoured the scheme. One of their votes will go as far in popular election as one of the most opulent. The former are most numerous, and it appeared that by far the majority of the representatives for 1740 were subscribers to, or favourers of, the scheme, and they have ever since been distinguished by the name of the land bank house.

"Men of estates and the principal merchants in the province abhorred the project, and refused to receive the bills, but great numbers of shopkeepers, who had lived for a long time before upon the fraud of a depreciating currency, and many small traders, gave credit to the bills. The directors, it was said, by a vote of the company, became traders, and issued just what bills they thought proper, without any fund, or security, for their ever being redeemed. They purchased every sort of commodity, ever so much a drug, for the sake of pushing off their bills, and by one means or other a large sum, perhaps fifty or sixty thousand pounds, was abroad. To lessen the temptation to receive the bills, a company of merchants agreed to issue their notes, or bills, redeemable by silver and gold, at distant periods, much like the scheme in 1733, and attended with no better effect. The governor exerted himself to blast this fraudulent undertaking, the land bank. Not only such civil and military officers, as were directors or partners, but all who received and paid any of the bills, were displaced. The governor negatived the person chosen Speaker of the House, being a director of the bank, and afterwards negatived thirteen of the new elected councillors, who were directors, or partners in, or reputed favorers of, the scheme. But all was insufficient to suppress it. Perhaps the major part in number of the inhabitants of the province openly, or secretly, were well-wishers to it. One of the directors afterwards acknowledged to me, that although he entered into the company with a view to the public interest, yet when he found what power and influence they had in all public concerns, he was convinced that it was

more than belonged to them, more than they could make a good use of, and therefore unwarrantable. Many of the most sensible discreet persons in the province saw a general confusion at hand. The authority of Parliament to control all public and private persons in the colonies was, in that day, questioned by nobody. Application was therefore made to Parliament for an act to suppress the company, which, notwithstanding the opposition made by their agent, was very easily obtained, and therein it was declared that the Act of the 6th of King George the First, chapter 18, did and does, and shall, extend to the colonies and plantations in America. It was said that the Act of George I., when it passed, had no relation to America; but another Act, twenty years after, gave it a force even from the passing it, which it never could have had without. This was said to be an instance of the transcendent power of Parliament. Although the company was dissolved, yet the Act of Parliament gave the possessors of the bills a right of action against every partner or director for the sums expressed, with interest. The company were in a maze. At a general meeting some, it was said, were for running all hazards, although the Act subjected them to a *præmunire*, but the directors had more prudence, and advised them to declare that they considered themselves dissolved, and met only to consult upon some method of redeeming their bills from the possessors, which every man engaged to endeavor, in proportion to his interest, and to pay in to the directors, or some of them, to burn and destroy. Had the company issued their bills at the value expressed in the face of them, they would have had no reason to complain of being obliged to redeem them at the same rate, but as this was not the case in general, and many of the possessors of the bills had acquired them for half their value, as expressed, equity could not be done, and so far as respected the company, perhaps Parliament was not very anxious, the loss they sustained being but a just penalty for their unwarrantable undertaking, if it had been properly applied. Had not the Parliament interposed, the province would have been in the utmost confusion, and the authority of government entirely in the land bank company."

393. The opposition of the governor, Mr. Belcher, to the land bank, aroused a strong animosity against him, which succeeded in displacing him, and a new governor was appointed. Upon his assuming office, he found affairs in some confusion. "But the grand affair to settle was that of the bills of credit. The instruction was expressed not to consent to any act, which should continue the bills beyond the time fixed for their being brought in. If this was complied with, a tax must have been made for the whole sum extant in that year, 1741. This, it was said, would be a burden that the people would never bear. Mr. Shirley (the governor) was sensible that the intent of his instructions was the prevention of a depreciating currency. No matter how large a sum in bills was current, if their value could be secured. If the spirit of the instruction could be preserved, an exact conformity to the letter would not be required; every scheme for fixing the value of the bills had failed. A new project was reported by a committee of the House, and accepted, and afterwards concurred by the council,

and consented to by the governor. This was a scheme to establish an ideal measure in all trade, and dealings, let the instrument be what it would. The Act which passed the court declared that all contracts should be understood payable in silver, at 6s. 8d. the ounce, and gold in proportion. Bills of a new form were issued, 20s. of which expressed in the face of the bill three ounces of silver, and they were to be received accordingly, in all public and private payments, with this saving, that if they should depreciate in their value, an addition should be made to all debts, as much as the depreciation from the time of contract to the time of payment. How to ascertain the depreciation from time to time, was the great difficulty in framing the Act. To leave it to a common jury would never do. There was some doubt whether a house of representatives would be wholly unbiassed. At length it was agreed that the eldest councillor in each county should meet once a year, and ascertain the depreciation. This is said to have been the scheme of Colonel Stoddart of Northampton, a gentleman of good sense and great virtue, who probably saw the defects, but hoped to substitute a lesser evil in the place of a greater.

"This at best must have been a very partial cure. It did not prevent the loss from the depreciation of the bills in those persons' hands, through which they were continually passing. All debts, which were contracted and paid between the periods when the value of the bills were fixed annually, could not be affected by such fixing, and, unless in debts of long standing, which the debtor could not pay without an action at law, demand was not ordinarily made for depreciation, and what rendered it of little effect in all other cases, the councillors appointed to estimate the depreciation never had firmness enough, in any instance, to make the full allowance, but when silver and exchange had rose 20 per cent. or more, an addition was made of 4 or 5 only. The popular cry was against it, and one year, when Nathaniel Hubbard, Esq., the eldest councillor for the county of Bristol, a gentleman of amiable character, and who filled the several posts he sustained with applause, endeavoured to approach nearer to a just allowance than had been made in former years, he felt the resentment of the House, who left him out of the council the next election. In short, the Act neither prevented the depreciation of the bills nor afforded relief in case of it, and was of no other service than to serve as a warning, when an Act passed for the establishing a fixed currency a few years after, to leave nothing to be done by any person, or bodies of men, or even future legislatures, to give the Act its designed effect, but in the Act itself, to make full provision for its execution in every part."

"In 1747," continues the historian, p. 435, "By the expedition to Louisburgh, the preparation for the reduction of Canada, and the several supplies of men for Nova Scotia, the province had issued an immense sum in bills of credit, between two and three millions, according to their denomination in the currency. The greatest part of this sum had been issued when between five and six hundred pounds was equal to about £100 sterling, and perhaps the real consideration the Government received from the inhabitants who gave credit to them was near £400,000 sterling,

and the whole debt of the province did not much exceed £200,000 sterling. Thus the people had paid £200,000, sterling in two or three years, besides a large sum raised by taxes each year, as much as it was supposed the people were able to pay; but to pay by the depreciation of the bills, although infinitely unequal, yet, as they were shifting hands every day, it was almost insensible, a possessor of a large sum for a few days, not perceiving the difference in their value between the time when he received them, and the time when he parted with them. The apprehension of their depreciation tended to increase it, and occasioned a quick circulation for some time, even for English goods, which ordinarily sell for the longest credit, nobody pretended to ask credit. They were constantly, however, dying in somebody's hand, though nobody kept them long by them. Business was brisk, men in trade increased their figures, but were sinking the real value of their stock, and, what is worse, by endeavours to shift the loss attending such a pernicious currency from one to another, fraudulent dispositions and habits are acquired, and the morals of the people depreciate with the currency.

"The Government was soliciting for the reimbursement of the charge in taking and securing of Cape Breton, and by the address, assiduity, and fidelity of William Bollan, Esq., who was one of the agents of the province for that purpose, there was a hopeful prospect that the full sum, £180,000 sterling, would be obtained.

"Some of the ministry thought it sufficient to grant such sum as would redeem the bills issued for the expedition, &c., at their depreciated value, and Mr. Kilby, the other agent, seemed to despair of obtaining more; but Mr. Bollan, who had an intimate knowledge of our public affairs, set the injustice of this proposal in a clear light, and made it evident that the depreciation of the bills was as effectually a charge borne by the people, as if the same proportion of bills had been drawn on by taxes, and refused all proposals of accommodation, insisting upon the full value of the bills when issued. He certainly has great merit for this and other services.

"Mr. Hutchinson, who was then Speaker of the House of Representatives, imagined this to be a most favourable opportunity for abolishing bills of credit, the source of so much iniquity, and for establishing a stable currency of gold and silver for the future. About £2,200,000 would be outstanding in bills in the year 1749. One hundred and eighty thousand pounds sterling, at eleven for one, which was the lowest rate of exchange with London for a year or two before, and perhaps the difference was really twelve for one, would redeem £1,980,000, which would leave but £220,000 outstanding; it was, therefore, proposed that the sum granted by Parliament should be shipped to the province, in Spanish milled dollars, and applied for the redemption of the bills, as far as it would serve for that purpose, and that the remainder of the bills should be drawn in by a tax on the year 1749. This would finish the bills. For the future, silver of sterling alloy, at 6s. 8d. the ounce, if payment should be made in bullion, or otherwise, milled dollars, at 6s. each, should be the lawful money of the province, and no person should receive or

pay, within the province, bills of credit of any of the other governments of New England. This proposal being made to the governor, he approved of it, as founded in justice, and tending to promote the real interest of the province, but he knew the attachment of the people to paper money, and supposed it impracticable. The speaker, however, laid the proposal before the house, where it was received with a smile, and generally thought to be an Utopian project, and rather out of deference to the speaker, than from an apprehension of any effect, the house appointed a committee to consider of it. The committee treated it in the same manner, but reported that the speaker should be desired to bring in a bill for the consideration of the house. When this came to be known abroad, exceptions were taken, and a clamour raised from every quarter. The major part of the people in number, were no sufferers by a depreciating currency, the number of debtors is always more than the number of creditors; and although debts on specialties had allowance made in judgments of court for depreciation of the bills, yet on simple contracts, of which there were ten to one specialty, no allowance was made. Those who were for a fixed currency were divided. Some supposed the bills might be reduced to so small a quantity, as to be fixed and stable, and therefore were for redeeming as many by bills of exchange, as should be thought superfluous; others were for putting an end to the bills, but in a gradual way, otherwise it was said a *fatal shock* would be given to trade. This last was the objection of many men of good sense. Douglass, who had wrote well upon the paper currency, and had been the oracle of the anti-paper party, was among them, and, as his manner was with all who differed from him, discovered as much rancour against the author and promoters of this new project, as he had done against the fraudulent contrivers of paper money emissions.

"The bills, it was said, had sunk gradually in their value from 6s. 10½d. to 60s. the ounce, by this means, creditors had been defrauded, it was but reasonable they should rise gradually, that justice might be done. But the creditors and debtors would not be the same in one instance in a thousand, and where this was not the case the injury was the same to oblige any one to pay more, as to receive less, than was justly due. Others were for exchanging the bills at a lower rate than the then current price of silver. The inhabitants had given credit to the government when silver was at 30s. the ounce, and ought to be paid accordingly. Two of the representatives of Boston urged their being exchanged at 30s., which would have given a most unreasonable profit to the present possessor, who had taken them at 55s. or 60s. To draw over some of this party concessions were made, and the bills were exchanged at 50s. the ounce, instead of 55s., as was at first proposed.

"Some of the directors and principal promoters of the land bank scheme, being at this time members of the general court, unexpectedly joined with the party, who were for finishing paper money; but the opposition was so great, that after many weeks spent in debating and settling the several parts of the bill, and a whole day's debate at last in a committee of the whole house, upon the expediency of passing

the bill, as thus settled, it was rejected, and the report of the committee accepted.

"It seems to be of no consequence to the prerogative, whether the currency of a colony be silver or paper; but the royal instructions, from time to time, for preventing a depreciating currency, caused merely by a gracious regard to the interest of the people, had generally engaged, what was called the country party, in opposition to them, and in favor of paper. It was the case at this time. However, the next morning, two of the members of the house, zealous adherers to this party, and who had been strong opposers of the bill, came early to the house to wait the coming of the speaker, and in the lobby let him know, that although they were not satisfied with several parts of the bill, yet they were alarmed with the danger to the province from the schemes of those persons, who were for a gradual reduction of the bills, and by that means for raising the value of the currency, without any provision for the relief of debtors, and therefore they had changed their minds; and if the bill could be brought forward again they would give their voice for it, and others, who had opposed it, would do the same. The speaker, who had looked upon any further attempt to be to no purpose, acquainted them that he did not think it proper to desire any of the favorers of the bill to move for a reconsideration of it, inasmuch as it had been understood, and agreed in the house, the day before, that if, upon a full debate had, the bill should be rejected, no further motion should be made about it. As soon as the house met, upon a motion by one of these members, seconded by the other, the bill was again brought under consideration, and passed the house, as it afterwards did the council, and had the governor's consent. The provision made by this Act for the exchange of the bills, and for establishing a silver currency, was altogether conditional, and depended upon a grant of Parliament for reimbursement of the charge of the Cape Breton expedition. This being at a distance, and not absolutely certain, the Act had no sudden effect upon the minds of the people, but when the news of the grant arrived, the discontent appeared more visible, and upon the arrival of the money, there were some beginnings of tumults, and the authors and promoters of the measure were threatened. The government passed an Act with a severe penalty against riots, and appeared determined to carry the other Act for exchanging the bills into execution. The apprehension of a shock to trade proved groundless; the bills being dispersed through every part of the province, the silver took place instead of them, a good currency was insensibly substituted in the room of a bad one, and every branch of business was carried on to greater advantage than before. The other governments, especially Connecticut and Rhode Island, who refused, upon being invited, to conform their currency to the Massachusetts, felt a shock in their trade, which they have not yet recovered. The latter had been the importers for the Massachusetts, of West India goods, for many years, which ceased at once. New Hampshire, after some years, revived its business, and increased their trade in English goods, which formerly they had been supplied with from the Massachusetts."

394. Thus we see exemplified in this colony.

exactly the same phenomena as we have already observed in England and Ireland from excessive issues of paper. Moreover, we see that when a paper currency, which was greatly depreciated, was in circulation, and another was issued, a great deal more depreciated, the paper currency which was the less depreciated immediately disappeared from circulation. The following figures, shewing the exchange with London and the price of silver, in Massachusetts, will illustrate their rise in consequence of paper issues :—

	Exchange with London.	Silver per ounce.		Exchange with London.	Silver per ounce.
1702 . .	133 .	6 10 $\frac{1}{2}$	1728 . .	840 .	18 0
1705 . .	135 .	7 0	1730 . .	880 .	20 0
1718 . .	150 .	8 0	1737 . .	500 .	26 0
1715 . .	175 .	9 8	1741 . .	550 .	28 0
1717 . .	225 .	12 0	1749 . .	1100 .	60 0
1722 . .	270 .	14 0			

395. We have not such full and minute records of the issues of paper currency in the other colonies as in Massachusetts, and the story must be pretty much the same in all. We shall, therefore, be very brief in regard to the other states. In 1702, the colonies were called upon to join in the war between England and Spain, and South Carolina fitted out an expedition against the Spanish settlement of St. Augustine, which left her with a debt of £6,000 sterling. The legislature passed an Act to stamp bills of credit. For five or six years these were not depreciated. But they were afterwards issued in such profusion, that they became more depreciated than in almost any other colony except Massachusetts.

396. In 1703 Barbadoes adopted the scheme of Mr. Woodbridge, of New England, for creating an issue of paper money, and emitted £80,000 at 4 per cent., the usual rate of interest being 10 per cent. The bills fell to 40 per cent. discount soon after they were issued, and threw everything into confusion in the island. A few years afterwards, orders were sent out from the court of England to the Governor, Mr. Crow, to remove from the Council, and all places of trust, all who had been concerned in the issue of paper.

397. In 1709, an expedition against Canada was planned, and New York issued £13,000 in bills, to fit it out. The bills were valued at 8s. the ounce in silver, and bore interest. This State was one of the most moderate in its issues, and the exchange with London never exceeded 190. In the same year New Jersey issued £3,000 in bills, to be cancelled the same year, and in 1711 it issued £5,000, to be cancelled in 1712 and 1713. In 1750, the West Jersey currency was equal to that of Pennsylvania, and the East Jersey currency to that of New York.

398. In 1710, Rhode Island was ordered to contribute to the Canada expedition. She then commenced the issue of paper money, or as the inveterate enemy of paper money, Dr. Douglass, says, "She has found that the most beneficial business has been *banking*, or negotiating a base, fraudulent paper money currency." From 1710 to 1747, this State issued at various times, on the whole £312,000, which was redeemed at different times. In 1748, Parliament voted money to the colonies to defray the expenses they had been put to, and Rhode Island applied the money to redeem the paper currency, and in that year paid off £88,725. In 1750, it had not more than

£708 sterling outstanding. But it had issued in addition another species of paper, to the amount of £390,000, in loans on land and other securities. There had been no increase in these since 1747, and they were being gradually reduced. The exchange in 1750 stood at 200.

399. In 1712, North Carolina engaged in war with the Tuscarorae, an Indian tribe settled within its limits, and issued bills to the amount of £8,000. In the same year South Carolina issued "a Bank" of £48,000. Exchange rose in the first year to 150; in the second to 200; in 1731 it stood at 700, and continued, with very little variation, at that rate for more than forty years.

400. In 1723, Pennsylvania made its first issue of paper money. In March it issued £15,000 of bills upon land, or plate, deposited with the loan office; it charged 5 per cent., and made the bills legal tender, on pain of forfeiting the debt, or the commodity. Heavy penalties were enacted against making a difference between paper and money. It was also enacted that one-eighth of the principal, as well as the interest, should be annually paid. The same year a fresh issue of £30,000 was made. The usual consequence followed. Specie had once been abundant in the colony, but it soon disappeared; and loud complaints were made that as all their money was paper, they had very little gold and silver, and when any came in, it was accounted as merchandise. Adam Smith says of this Pennsylvania paper, "The government of Pennsylvania indeed pretended, upon their first emission of paper money in 1722, (1723) to render their paper of equal value with gold and silver, by enacting penalties against all those who made any difference in the price of their goods when they sold them for a colony paper, and when they sold them for gold and silver; a regulation equally tyrannical, but much less effectual than that which it was meant to support. A positive law may render a shilling a legal tender for a guinea, because it may direct the courts of justice to discharge the debtor who has made that tender. But no positive law can oblige a person who sells goods, and who is at liberty to sell or not to sell, as he pleases, to accept of a shilling as equivalent to a guinea in the price of them. Notwithstanding any regulation of this kind, it appeared by the course of exchange with Great Britain, that £100 sterling was occasionally considered an equivalent in some of the colonies to £130, and in others to so great a sum as £1,100 currency; this difference in the value arising from the difference in the quantity of paper emitted in the different colonies, and in the distance and probability of the term of its final discharge and redemption. * * *

"Pennsylvania was always more moderate in its emission of paper money than any other of our colonies. Its paper currency, accordingly, is said never to have sunk below the value of the gold and silver, which was current in the colony before the first emission of its paper money. Before that emission the colony had raised the denomination of its coin, and had, by act of Assembly, ordered 5s. sterling to pass in the colony for 6s. 3d., and afterwards for 6s. 8d. A pound colony currency, therefore, even when that currency was gold and silver, was more than 30 per cent. below the value of a pound sterling, and when that currency was

turned into paper, it was seldom more than 30 per cent. below that value. The pretence for raising the denomination of the coin, was to prevent the exportation of gold and silver, by making equal quantities of those metals pass for greater sums in the colony than they did in the mother country. It was found, however, that the price of all goods from the mother country rose exactly in proportion as they raised the denomination of their coin, so that their gold and silver were exported as fast as ever."

401. In this passage, Adam Smith has much underrated the depreciation of the provincial paper in general. So far from Pennsylvania maintaining her paper of equal value with gold and silver, we find that from 1723 to 1726 the price of gold was £6 6s. 6d., and silver 8s. 3d. the ounce; and from 1730 to 1738, gold was £6 9s. 3d., and silver 8s. 9d. the ounce, and the exchange with Great Britain in 1748 was 180, as may be seen in the subsequent table.

402. In 1734 Maryland began to issue paper money, which it did to the amount of £90,000. In 1740, 8s. of Pennsylvania currency was equal to 12s. of Maryland; and in 1748, £200 Maryland was equal to £100 sterling. Virginia was the only colony which abstained from paper issues till the War of Independence.

403. The following figures shew the state of the various colonial currencies compared to £100 sterling:—

	1740	1748
New England	525	1100
New York	160	190
New Jersey	160	180
Pennsylvania	170	180
Maryland	200	200
North Carolina	1400	1000
South Carolina	800	750
Rhode Island	200	200
Virginia		120

This table shews that the depreciation was very much more extensive than Adam Smith supposed, and that he was quite wrong in supposing that the Pennsylvania paper did not fall below specie.

404. At length the intolerable state of these colonial currencies, being a perfect nuisance to trade, was brought before Parliament, and an Act, Statute 1751, c. 53, was passed to regulate and restrain paper bills of credit in Rhode Island, Providence, Connecticut, Massachusetts Bay, and New Hampshire. By this Act, after stating that the Statute of Anne for ascertaining the rate of foreign coins in the American plantations had been frustrated in the above colonies, by the Assemblies issuing great quantities of bills of credit, and making them legal tender, it enacted that after the 29th September, 1751, no governor of these provinces was to give his assent to any bill creating such paper currency, on any pretence whatever, or to prolong the period of calling in the existing bills, which were all to be called in strictly according to their tenor. But the Assemblies might create bills for the current service of the year, provided funds were prepared to redeem them in two years; or in the case of extraordinary emergencies of government, such as war, or invasion, but in such a case ample provision must be made to redeem them within five years. And after the same day, no paper currency of any sort or description was to be made legal tender.

405. Twelve years later, this Act was made

general, and applied to all the American colonies. By the Act, Statute 1763, c. 34, reciting that great quantities of bills of credit had been made, and issued, and declared legal tender, by Acts of the different Assemblies, and that they had greatly depreciated in value, by which means debts had been paid with a much less value than had been contracted for, it enacted that after the 1st September, 1764, any Act creating bills of credit, and paper money of all sorts, legal tender, should be void, as well as any Act made to prolong the legal tender of existing bills beyond the period for calling them in. If the governor of any province gave his assent to any Act for the above purposes, he should forfeit £1,000, be immediately dismissed from his office, and for ever be incapable of being employed.

406. This measure was vehemently opposed by Franklin, who, in 1764, drew up a paper in answer to the reasons assigned in a Report from the Board of Trade for its adoption. This paper contains a most curious mixture of truth and error (*Memoirs, Edition London, 1833, Vol. V. p. 356*), for he is still infected with the error that the balance of trade was the cause of the disappearance of gold and silver. He strenuously defends the use of paper money in the states, while acknowledging its excessive issues on some occasions. He says, "Pennsylvania, before it made any paper money, was totally stript of its gold and silver, though they had from time to time, agreed to take gold and silver coins at higher and higher nominal values, in hopes of drawing money into and retaining it for the internal uses of the province. During that weak practice silver got up by degrees to 8s. 9d. per ounce, and English crowns were called 6, 7, and 8 shilling-pieces long before paper money was made. But this practice of increasing the denomination was found not to answer the end. The balance of trade carried out the gold and silver as fast as it was brought in, the merchants raising the price of their goods in proportion to the increased denomination of the money. The difficulties for want of cash were accordingly very great, the chief part of the trade being carried on by the extremely inconvenient method of barter; when in 1723, paper money was first made there, which gave new life to business, promoted greatly the settlement of new lands (by lending small sums to beginners on easy interest to be repaid by instalments,) whereby the province has so greatly increased in inhabitants, that the export from hence thither, is now more than tenfold what it then was, and by their trade with foreign colonies they have been able to obtain great quantities of gold and silver to remit hither, in return for the manufactures of this country. New York and New Jersey have also increased greatly during the same period, with the use of paper money; so that it does not appear to be of the ruinous nature ascribed to it. And if the inhabitants of those countries are glad to have the use of paper among themselves, that they may thereby be enabled to spare for remittances hither, the gold and silver they obtain by their commerce with foreigners, one would expect that no objection against their parting with it could arise here, in the country that receives it."

407. Franklin admits, that in particular instances, at particular times and places, during times of war and danger, and in some cases, as in

New England, from excessive issues, the merchants trading to these colonies might sometimes have suffered by a sudden and unforeseen rise of exchange. But he says that the merchants trading to the middle colonies, (New York, New Jersey, and Pennsylvania) had never suffered by any rise of exchange, as it was a constant rule there to consider British debts as payable in Britain, and only to be discharged by as much paper as would purchase a bill for the full sterling sum, whatever the rate of exchange might be. The use of paper money had been beneficial, both to the merchants and the colonists, who were so sensible of its benefits, that they had petitions to have it allowed.

408. It was alleged in the report of the Board of Trade, that every medium of trade should have an *intrinsic value*, which paper money has not. Gold and silver are, therefore, the fittest for this medium, as they are an equivalent, which paper can never be." In replying to this, Franklin has some true remarks. He urges the hardship of putting down paper in the colonies, when the greater part of business in London was carried on with bank bills, and bankers' notes, which had no *intrinsic value*, but rested on the credit of those that issued them, as paper bills in the colonies did on the credit of the respective governments there. He defends their being made legal tender, and redeemable after a certain time. "At this very time," he says, "even the silver money in England is obliged to be the legal tender for part of its value, that part which is the difference between its real weight and its denomination. Great part of the shillings and sixpences now current, are by wearing become 5, 10, 20, and some of the sixpences even 50 per cent. too light. For this difference between the *real* and the *nominal*, you have no *intrinsic value*; you have not so much as paper, you have nothing. It is the legal tender, with the knowledge that it can easily be repassed for the same value, that makes three-penny worth of silver pass for sixpence. Gold and silver have undoubtedly some properties, that give them a fitness above paper, as a medium of exchange, particularly their *universal estimation*, especially in cases where a country has occasion to carry its money abroad, either as a stock to trade with, or to purchase allies and foreign succours. Otherwise, that very universal estimation is an inconvenience, which paper money is free from, since it tends to deprive a country of even the quantity of currency that should be retained as a necessary instrument of its internal commerce, and obliges it to be continually on its guard, in making and executing at a great expense the laws that are to prevent the trade which exports it. Paper money, well funded, has another great advantage over gold and silver, its lightness of carriage, and the little room that is occupied by a great sum, whereby it is capable of being more easily, and more safely, because more privately, conveyed from place to place. Gold and silver are not *intrinsically* of equal value with iron, a metal in itself capable of many more beneficial uses to mankind. *Their value rests chiefly in the estimation they happen to be in among the generality of nations, and the credit given to the opinion that that estimation will continue, otherwise a pound of gold would not be a real equivalent*

for even a bushel of wheat. ANY OTHER WELL FOUNDED CREDIT IS AS MUCH AN EQUIVALENT AS GOLD AND SILVER, and in some cases more so, or it would not be preferred by commercial people in different countries. Not to mention again our own bank bills, Holland, which understands the value of cash, as well as any people in the world, would never part with gold and silver for credit, (as they do when they put it into their bank, from whence little of it is ever after drawn out) if they did not think and find the credit a full EQUIVALENT." From this extract it appears that Franklin saw clearly, what we have shewn elsewhere, (CURRENCY; BANK NOTE) that money is only universal credit, and that it is its *exchangeability* that gives it value, and not the *cost of its production*, or the *labor of producing it*. But he has not shaken himself free of the confusion between use and value.

409. The last reason alleged for suppressing the paper was that, even in the middle colonies, where the issues were least, the paper was constantly depreciated. To this Franklin says, "If the rising of the value of any particular commodity wanted for exportation is to be considered as a depreciation of the values of whatever remain in the country, then the rising of silver above paper to that height of additional value, which its capability of exportation only gave it, may be called a depreciation of the paper. Even here (i. e. London) as bullion has been wanted, or not wanted, for exportation, its price has varied from 5s. 2d. to 5s. 8d. per ounce. This is near 10 per cent. But was it ever said or thought on such an occasion, that all the bank bills, all the coined silver, and all the gold in the kingdom were depreciated 10 per cent.?" Now the author himself had very clearly furnished an answer to his own question, because he had already told us a few paragraphs before, that the currency of the country was then in a very degraded state, and it is quite clear that it would only pass for its weight in bullion in foreign countries. Consequently it is quite clear that it *was* depreciated. To which must be added that it was then illegal to export coin, and consequently that would still more depreciate its value, as compared to bullion. Franklin however states that the rate of the paper had not varied for forty years, and was the same when the issue was £15,000 as when it was £600,000. And he anticipates the arguments of the anti-bullionists in 1804 and 1811. "It has indeed been usual with the adversaries of a paper currency to call every rise of exchange with London, a depreciation of this paper; but this notion appears to be by no means just. For if the paper purchases everything but bills of exchange at the former rate, and these bills are not above one-tenth of what is employed in purchases, then it may be more properly and truly said, that the exchange has risen, than that the paper has depreciated." He then discusses some plans that had been proposed for making a paper currency, but which should not be legal tender, but pronounces them all to have been failures, and concludes that, "on the whole, no method has hitherto been formed to establish a medium of trade in lieu of money, equal in all its advantages to bills of credit—funded on sufficient taxes for discharging it, or on land security of double the value, for repaying it at the end of the term, and

in the meantime, made a general legal tender. The experience of now near half a century in the middle colonies, has convinced them of it among themselves, by the great increase of their settlements, numbers, buildings, improvements, agriculture, shipping, and commerce." Adam Smith entirely approved of the Act suppressing these colonial issues of paper money. Ten years afterwards, by the Act, Statute, 1773, c. 57, it was enacted, that after the 1st of September that year, any certificates, notes, bills, or debentures, which had been voluntarily accepted by the creditors of the public, as a security for payment of their debts, might be declared legal tender, in payment of taxes, duties, or any debts due to the public treasuries of the respective colonies. This closes the first era of American paper money.

410. On the 5th September, 1774, delegates from the different provinces in North America met in Philadelphia, as the first Congress. The War of Independence commenced soon afterwards, and in the next year, Congress found that it had no resources to carry it on with, as it had no power to impose taxes. In July, 1775, it was determined to issue bills of credit on the faith of the *Continental*. Benjamin Franklin was a strenuous adviser of this plan, as the only one that could carry the country through the contest. On the 25th July, 1775, 300,000 million dollars in paper were issued, which were to be redeemed in gold and silver in three years, and they were proportioned among the twelve States, which at that time sent delegates to Congress. That body could only recommend the several States to impose taxes to redeem these bills. The national enthusiasm, for a considerable time, supported the value of these bills, and in January, 1776, a resolution of Congress denounced those who obstructed their circulation, as enemies to their country. No depreciation was apparent until the issues reached 9,000,000 dollars, and no difference between specie and paper began to be seen until the campaign of 1776 was far advanced. But it was quite evident to every reflecting person, that this could not go on indefinitely. Congress could not regulate the amount of bills in circulation, as every local legislature claimed and exercised the right of issuing them as well. To impose taxes was the only way to reduce the number, but this Congress could not do, and the local legislatures were afraid to do so, for fear of exciting discontent, and damping the ardour of the people for the war. Lotteries and loans were tried with little success, as the constant necessity for issuing new bills, completely outdid the small benefit of calling in the paper by these trifling means. During 1776 upwards of twenty million dollars were issued, and in the beginning of 1777 the depreciation began to be sensibly perceived. It was, as usual, mistaken by many as a rise in the price of every article brought to market, and the usual futile attempt was made to sustain its value by violent remedies. Congress resolved that whoever made a difference between gold and silver and continental bills should be deemed as enemies to the liberties of the United States, and forfeit the value of the money, or other thing purchased. The provincial legislatures were also invited to pass laws declaring these bills legal tender, and

resolutions pledging themselves to redeem their respective quotas of paper at the end of the war, which was done, and merchants were ordered to pay all debts due by them to British creditors into the state treasury, which was declared to be a complete discharge to them from their creditors.

411. The course pursued by Congress on this occasion, was very similar to that followed twenty years later by the National Assembly of France, and partially by our Parliament in 1812, and we shall quote from an American author, Mr. Palatiah Webster, an account of it. "The fatal error that the credit and currency of continental money could be kept up, and supported by acts of compulsion, entered so deep into the minds of Congress, and all departments of administration through the States, that no consideration of justice, religion, or policy, or even experience of its utter inefficiency could eradicate it; it seemed to be a kind of obstinate delirium, totally deaf to every argument drawn from justice and right, from its natural tendency and mischief, from common justice and even from common sense.

"Congress began as early as January 11, 1776, to hold up and recommend this *maxim of mania*, when continental money was but five months' old. Congress then resolved that whoever should refuse to receive in payment continental bills, should be declared and treated as an enemy of his country, and be precluded from intercourse with its inhabitants, i. e., should be *outlawed*, which is the severest penalty (except of life and limb) known to our laws.

"This ruinous principle was continued in practice for five successive years, and appeared in all shapes and forms, i. e., in *tender acts*, in *limitation of prices*, in *awful and threatening declarations*, in *penal laws*, with dreadful and ruinous punishments, and in every other way that could be divined, and all executed with a relentless severity by the highest authorities then in being, viz., by Congress, by Assemblies, and conventions of the States, and by committees of inspection (whose power in those days were nearly sovereign), and even by military force; and though men of all descriptions stood trembling before this monster of force, without daring to lift a hand against it during all this period, yet its unrestrained energy always proved ineffectual to its purposes, but in every case increased the evils it was designed to remedy, and destroyed the benefits it was intended to promote; at best, its utmost effect was like that of water sprinkled on a blacksmith's forge, which, indeed, deadens the flame for a moment, but never fails to increase the heat and flame of the internal fire. Many *thousand families*, of full and easy fortune, were ruined by these fatal measures, and lie in ruins to this day (1790). without the least benefit to the country, or to the great and noble cause in which we were then engaged."

412. Mr. Webster describes the injuries inflicted on the country by the enemy, who had possession first to last of eleven of the capitals of the thirteen states, and ravaged the country in all directions, burning in cool blood a great number not only of houses, barns, mills, &c., but also of most capital towns, and villages. He also describes the immense losses caused to the inhabitants by seizing all their property, that was wanted for the public service. And yet he says that all these

injuries and losses were not so great as those caused by the continental money. "We have suffered more from this cause, than from *every other* cause of calamity; it has killed more men, pervaded and corrupted the choicest interests of our country more, and done more injustice than even the arms and artifices of our enemies."

413. At last in May, 1781, certain compulsory measures of the Executive Council of Pennsylvania, for the purpose of supporting the credit of the continental money, and the state bills, destroyed the system. "Thus," says Mr. Webster, "fell, ended, and died, the continental currency, aged six years. Bubbles of another sort, such as the Mississippi scheme in France, and the South Sea in England, lasted but a few months, and then burst into nothing; but this held out much longer, and seemed to retain a vigorous constitution to the last; for its circulation was never more brisk than when its exchange was 500 to 1; and yet it expired without a groan or struggle; and I believe of all things which ever suffered dissolution since life was first given to the creation, this mighty monster died the least lamented. If it saved the State, it has also polluted the equity of our laws, turned them into engines of oppression and wrong; corrupted the justice of our public administration; destroyed the fortunes of thousands of those who had the most confidence in it; enervated the trade, husbandry, and manufactures of our country; and gone far to destroy the morality of our people."

414. On the 31st of May, 1781, these continental bills ceased to circulate as money, but they were afterwards bought up on speculation from 400 up to 1,000 to 1. The exchange was very different in different parts of the country. It generally followed Philadelphia, though, sometimes, was considerably behind it; thus, in January, 1781, while it was 100 for 1 at Philadelphia, it was 75 for 1 in Virginia; and in April, when it was 135 for 1 at Philadelphia, it was 100 for 1 in Virginia. In May, 1781, when it was 225 for 1 at Philadelphia, it was 75 for 1 at Boston.

415. The quantities of it issued and the depreciation it underwent, are exhibited in the following figures:—

In 1775, issued in dollars . . .	3,000,000
1776	20,064,464
1777	26,426,833
1778	66,963,269
1779	149,708,856
1780	88,799,556
1781	12,587,344
	<hr/>
	\$362,546,822

The following table shews the rates of exchange for money at Philadelphia. Up to the end of 1776 there was no sensible depreciation:—

	1777	1778	1779	1780	1781
January . . .	14	4	7, 8, 9	40-45	100
February . . .	14	5	10	45-55	100-120
March . . .	2	5	10, 11	60-65	120-135
April . . .	24	6	12-22	60	135-200
May . . .	24	5	22-24	60	200-500
June . . .	24	4	22-18	60	
July . . .	8	4	18-20	60-65	
August . . .	8	5	20	65-75	
September . .	8	5	20-28	75	
October . . .	8	5	30	75-80	
November . .	8	6	32-45	80-100	
December . .	4	6	45-88	100	

416. In May, 1781, Congress determined to issue no more continental money, but to leave each State to raise, pay, and equip its quota of troops. A great reform in the administration also took place, for, up to this time, each department was under the management of a Committee of Congress, or a Board, the consequences of which need not be described. It was now determined to put each department under the control of a single responsible head. And amongst others, Mr. Morris, delegate from Pennsylvania, who had been very active in establishing a bank at Philadelphia, was appointed superintendent of finances, which he re-organized, in a very able manner, in 1781. This gentleman laid before Congress, on the 26th May, 1781, a plan for a National Bank, with a capital of 400,000 dollars, to be paid up by subscription, and to be incorporated by the Government, and to have its books open to the superintendent of finance. Their notes were to be receivable as specie from the respective States, into the treasury of the United States. This plan was approved of by Congress, and the Charter of Incorporation was granted on the 31st December, 1781. Thus terminated the second era of American paper money.

417. The constantly depreciating value of the continental money, the impotence of Congress to lay on taxes, and the failure of the loan and lottery schemes, convinced Washington that there was only one way of extricating the country from its financial embarrassment, and that was to raise a loan in Europe. With this view he despatched a Colonel Laurens to France in 1781, charged with the duty of negotiating a loan from the French ministry. In this he partially succeeded. Large loans were negotiated in 1782 and 1783. The cessation of the war expenditure took away the necessity for further issues, and such a conviction of the necessity of public supplies generally took place through the States, that considerable sums were raised by a tax on polls and real estates.

418. The Bank was incorporated under the name of the "President, Directors, and Company of the Bank of North America," and commenced business in January, 1782. There were not more than 70,000 dollars subscribed in specie before October, 1781; but a French frigate having brought 470,000 dollars, Mr. Morris subscribed the remainder of the necessary capital on behalf of the government of the United States, which thus became the principal stockholder in it. As the mischiefs of the continental money were still fresh in the mind of the people, there was much difficulty, at first, in obtaining currency for its notes. But as it made a profuse display of its cash, it gradually increased in credit. The bank not only got the Act of Congress to establish it, but obtained a charter as well from the State of Pennsylvania, in which it is situated, in April, 1782. The business soon became extremely profitable, and this naturally created a desire in others to participate in these profits. A project for a second bank was formed, to be called the Bank of Pennsylvania. In order to prevent this, the bank was obliged, much against its will, to enlarge its capital, and receive a new body of subscribers. The bank prospered during 1784 and 1785. But in the spring of that year a very formidable opposition was organized against it, and

petitions were presented in March to the Assembly for a repeal of the charter. A committee of the House reported in favor of the allegations of the petitioners, and on the 13th of the following September the charter was repealed. The bank, however, claimed the right to continue business under the Act of Congress. In the following year its friends tried to obtain a re-grant of its charter, but did not succeed. On the 17th March, 1787, it was re-incorporated for 14 years; and by successive Acts it still exists.

419. The intolerable evils of the provincial paper money before the War of Independence, and of the continental paper money during the war, were so clear and indisputable, that the framers of the Constitution of the United States sagaciously seized the opportunity to provide once for all against the possibility of their recurrence. By Article I., Section 10, of the Constitution of the United States, it is declared, that no State shall COIN MONEY; EMIT BILLS OF CREDIT; OR MAKE ANYTHING BUT GOLD AND SILVER COIN A TENDER IN PAYMENT OF DEBTS.

420. The feeble powers of Congress after the achievement of independence, for several years prevented them from having the means to meet the public engagements. But no sooner was the Constitution reformed in 1787, and brought into efficient working order, than the government, at the head of which Washington was now placed, directed its attention to restore public credit, and fulfil the national engagements. In August, 1790, Mr. Hamilton, the secretary to the Treasury, was directed to prepare a Report on Public Credit, which was presented to Congress in December, 1790. It appears by this document that at that time the debt of the United States amounted to \$1,854,464 dollars, divided into a foreign debt of 10,070,307, bearing an interest partly of 4, and partly of 5, per cent., with arrears of interest amounting to 1,640,072 dollars; and a domestic debt of 27,383,918 dollars, bearing an interest of 6 per cent., with arrears amounting to 13,030,168 dollars. But these debts were apportioned out to the different States. The secretary proposed various plans of funding and liquidating this debt, and in this, he brings forward an idea which has been very commonly entertained by many eminent persons even in this country, and which is one of the subtleties of Political Economy, i.e., that the public funds are money, or currency. In recommending that the debt be funded, he says, (*Gales and Seaton's Congressional Debates*, Vol. II., p. 2044.) "But there is a consequence of this less obvious, though not less true, in which every other citizen is interested. It is a well known fact, that in countries where the national debt is properly funded, and an object of undoubted confidence, it answers most of the purposes of money. Transfers of stock, or public debt, are then equivalent to payments in specie, or, in other words, stock, in the principal transactions of business, passes current as specie. The same thing would in all probability happen here under the like circumstances. The benefits of this are various and obvious. First, trade is extended by it, because there is a larger capital to carry it on, and the merchant can, at the same time, afford to trade for smaller profits, as his stock which when unemployed, brings him in an interest from the Government, serves him also as

money, when he has a call for it in his commercial operations. Secondly, agriculture and manufactures are also promoted by it, for the like reason, the more capital can be commanded to be employed in both; and because the merchant, when enterprise in foreign trade gives to them certainty and extension, has greater means for enterprise. Thirdly, the interest of money will be lowered by it; *for this is always in a ratio to the quantity of money, and to the quickness of circulation.* This circumstance will enable both the public and individuals to borrow on easier and cheaper terms. And from the combination of these effects, additional aid will be furnished to labor, to industry, and to arts of every kind. But these good effects of a public debt are only to be looked for when, by being well funded, it has acquired an adequate and stable value. Till then it has rather a contrary tendency. The fluctuation and insecurity incident to it in an unfunded state, render it a mere commodity and a precarious one. As such, being only an object of occasional and particular speculation, all the money applied to it is so much diverted from the more useful channels of circulation, for which the thing itself affords no substitute; so that, in fact, one serious inconvenience of an unfunded debt is, that it contributes to the scarcity of money. This distinction, which has been little, if at all, attended to, is of the greatest moment. It involves a question immediately interesting to every part of the community, which is no other than this, whether the public debt, by a provision for it on true principles, shall be rendered a substitute for money, or whether by being left as it is, or being provided for in such a manner as will wound these principles, and destroy confidence, it shall be suffered to continue, as it is a pernicious drain of our cash from the channels of productive industry." In this extract we have two of the most subtle principles of Political Economy mooted, 1st:—He says, that the public funds are money, or currency. 2ndly:—That the interest of money is always in proportion to the quantity of it, both of which are fundamental errors of great importance, and which are fully investigated under their respective heads. (CURRENCY. INTEREST.)

421. Concurrently with the report on public credit, the secretary presented an elaborate report on the expediency of establishing a National Bank, in which its advantages are set forth, and its alleged disadvantages examined and answered, which well deserves an attentive reading. Mr. Hamilton was perfectly well aware of what, by recent economists in England, has been strenuously denied, *that banks increase capital*, and he shews that knowledge of its mechanism, the want of which is so conspicuous in English writers, which we have already had to notice in the former part of this article. Mr. Hamilton, says, (*Gales and Seaton*, Vol. II., p. 2083). "The following are among the principal advantages of a bank. First, the AUGMENTATION of the active or productive capital of a country. * * * It is a well established fact, that banks in good credit can circulate a far greater sum than the actual quantum of their capital in gold and silver. The extent of the possible excess seems indeterminate, though it has been conjecturally stated at the proportions

of two and three to one. This faculty is produced in various ways:—1st. A great portion of the notes which are issued, and pass current as cash, are indefinitely suspended in circulation, from the confidence which each holder has that he can at any moment turn them into gold and silver. 2ndly. *Every loan which a bank makes is, in its first shape, a CREDIT GIVEN to the borrower on its books*, the amount of which it stands ready to pay, either in its own notes, or gold, or silver, at his option. But, in a great number of cases, no actual payment is made in either. The borrower frequently, by a cheque, or order, transfers his credit to some other person, to whom he has a payment to make; who, in his turn, is as often content with a similar credit, because he is satisfied that he can, whenever he pleases, either convert it into cash, or pass it to some other hand, as an equivalent for it. *And in this manner the credit keeps circulating, performing, in every stage, the office of money*, till it is extinguished by a discount with some person, who has a payment to make to the bank to an equal or greater amount. Thus large sums are lent and paid, frequently through a variety of hands, without the intervention of a single piece of coin. 3rdly. There is always a large quantity of gold and silver in the repositories of the bank, besides its own stock, which is placed there, with a view partly to its safe keeping, and partly to the accommodation of an institution, which is itself a source of general accommodation. These deposits are of immense consequence in the operation of a bank. Though liable to be re-drawn at any moment, experience proves that the money so much oftener changes proprietors than place, and that what is drawn out is generally so speedily replaced, as to authorize the counting upon the sums deposited as an effective fund, which, concurring with the stock of the bank, enables it to extend its loans, and to answer all the demands for coin, whether in consequence of those loans, or arising from the occasional return of its notes. These different circumstances explain the manner in which the ability of a bank to circulate a greater sum than its actual capital in coin is acquired. * * *

The same circumstances illustrate the truth of the position, *that it is one of the properties of banks to increase the active capital of a country*. This, in other words, is the sum of them; the money of an individual, while he is waiting for an opportunity to employ it, by being either deposited in the bank for safe keeping, or invested in its stock, is in a condition to administer to the wants of others, when he could not himself make use of it, and keeps the money itself in a state of incessant activity. In the almost infinite vicissitudes and competition of mercantile enterprise, there never can be a danger of an intermission of demand, or that the money will remain for a moment idle in the vaults of the bank. *This additional employment given to money, and the faculty of a bank to lend and circulate, a greater sum than the amount in coin, ARE TO ALL THE PURPOSES OF TRADE AND INDUSTRY, AN ABSOLUTE INCREASE OF CAPITAL*. Purchases and undertakings in general, can be carried on by any given sum of bank paper, or credit, as effectually as by an equal sum of gold and silver. And thus, by contributing to enlarge the mass of industrious

and commercial enterprise, banks become nurseries of national wealth—a consequence as satisfactorily verified by experience, as it is clearly deducible in theory.”

422. This extract is an effectual refutation of the current opinion in English books that a bank only gives a greater activity to *existing* capital, and the common opinion that a banker only *lends* out what he receives. It is perfectly plain that Mr. Hamilton knew well that a banker trades by *creating credit*, which performs the function of money. That a banker makes a loan, in the first instance, by creating a credit, and not as Sir Robert Peel said, by making a *bonâ fide* advance of capital.

423. The report then explains the reasons why it was inexpedient to graft a new National Bank on the Bank of North America, which had, however, done great service to the national cause, during the period of its existence, but which now having accepted a charter from a provincial state, was rather to be considered as a provincial bank of Pennsylvania, than a national one. He accordingly presented a plan of a new National Bank to be incorporated, with a capital not exceeding 10,000,000 dollars, three-fourths of which might be paid up in the stock, or the public debts of the Union.

424. Mr. Hamilton was decidedly against making land the basis of paper currency. “Another wish, dictated by the particular situation of the country, is, that the bank could be so constituted, as to be made an immediate instrument of loans to the proprietors of land; but this wish also yields to the difficulty of accomplishing it. *Land is, alone, an unfit fund for bank circulation*. If the notes issued upon it were not to be payable in coin on demand, or at a short date, *this would amount to nothing more than a repetition of the paper emissions, which are now exploded by the general voice*. If the notes are to be payable in coin, the land must first be converted into it by sale, or mortgage. The difficulty of effecting the latter is the very thing which begets the desire of finding another resource; and the former would not be practicable on a sudden emergency, but with sacrifices which would make the cure worse than the disease. Neither is the idea of constituting the fund partly of coin, and partly of land, free from impediments.”

425. This report was presented to both houses of Congress, and the plan was adopted without discussion by the Senate, and it passed with equal ease through the house of Representatives, until it came to the third reading, when most unexpectedly, the most vehement opposition was made to it, on a point which has been most warmly contested from that day to this, namely, *whether Congress had the power to erect a Corporation*.

426. This objection touched the very foundations of the constitutional powers of Congress. It was argued at great length by Mr. Madison on the 2nd of February, 1791. (*Gales and Seaton, Vol. II., p. 1944.*) but as it is a great constitutional question, we of course cannot enter into it, we can only say that after being debated for a week, with extraordinary keenness, it was at last carried by a majority of 39 to 20, that the bill should pass. The division of opinion on the constitutionality of the question was equally

strong in the cabinet, as in the house of representatives, and the country, but Washington having demanded an elaborate argument from each party, after mature deliberation, formed the opinion that the measure was constitutional, and gave his assent to it.

427. By Acts, Acts of the First Congress of the United States, chapters 84 and 85, February 25, and March 2, 1791, subscriptions were to be opened on the 1st July, 1791, for a bank, to be called the "Bank of the United States," with a capital stock not to exceed 10,000,000 dollars, in shares of 400 dollars, to which any one might subscribe, for not more than 1000 shares, one-fourth of which was to be paid in gold and silver, and the remainder in the public debt of the United States, bearing 6 per cent. interest. The subscribers were to exist as a corporation until the 4th of March, 1811. The total amount of debts which the corporation might at any time owe in any manner, should not exceed 10,000,000 dollars, over and above the moneys actually deposited in the bank for safe keeping, unless the contracting any greater debt should be previously authorized by a law of the United States. In case of excess, the directors, under whose administration it should happen, should be liable in their private capacities, as well as all the lands, tenements, goods and chattels of the corporation. It might sell any part of the public debt, which composed its stock, but it might not buy any; and it was not to deal, or trade, in anything except bills of exchange, or gold and silver bullion, or the sale of goods, pledged with it, and not redeemed in due time, and it might not charge more than 6 per cent. for advances. It was not to lend the government of the United States more than 100,000 dollars, or that of any State in the Union more than 50,000 dollars, without a law for that purpose. The subscription list was filled up in two hours.

428. This bank continued in operation till the term of its charter expired. As that period approached, the warm discussions as to its benefits, and constitutionality, were revived. On the 24th of January, 1811, the House of Representatives, by a majority of sixty-five to sixty-four, resolved to postpone the consideration of re-chartering it indefinitely. A bill, brought into the Senate for the same purpose, was rejected by the casting vote of the Vice-President, on the 20th February, only eleven days before the Charter expired. The bank during this interval applied to have its charter prolonged for a sufficient time to allow it to wind up. But the Committee of the House, to whom the memorial was referred, reported, through their chairman, Henry Clay, "that holding the opinion, (as a majority of the Committee do,) that the constitution did not authorize Congress originally to grant the Charter, it follows, as a necessary consequence of that opinion, that an extension of it, even under the restrictions contemplated by the stockholders, is equally repugnant to the constitution." The bank was, therefore, obliged to wind up, and on the 1st June, 1812, 70 per cent. of the capital stock was repaid to the shareholders, and 18 per cent. more on the 1st October, another 7 per cent. on the 1st April, 1813, another of 5 per cent. in April, 1815, and another of 5 per cent. in December,

1817, and some other payments were made subsequently.

429. At the time of the institution of the Bank of the United States, there were but four banks in the States,—the Bank of North America, erected by an Act of Congress of very doubtful legality, a bank at New York, one at Boston, and one in Maryland. Soon after that they multiplied rapidly. In 1791, one new bank was erected; in 1792, 8; in 1793, 3; in 1795, 5; in 1796, 1; in 1800, 2; in 1801, 3; in 1802, 4; in 1803, 16; in 1804, 10; in 1805, 4; in 1806, 4; in 1807, 9; in 1808, 1; in 1809, 3; in 1810, 8; in 1811, 11; in 1812, 22; the capital of these formed an aggregate of 77,258,000 dollars. In 1814, a project was brought before the Assembly of Pennsylvania, by which forty-one new banks would have been established at once, but the Governor, in well founded alarm, rejected it. But yet they multiplied with astonishing rapidity, for, by 1816, they amounted to 246. The same nuisance was felt from the power of issuing notes without limit as to their amount, as was felt in this country. In 1814, the New England Banks issued notes for 25 cents, whereby it was rendered so difficult in some of the Eastern States to get a dollar changed, that it was necessary to purchase change of the money dealers in towns, for current travelling expenses. And many of the banks, with many hundred thousand of paper dollars in circulation, had little or no specie in their coffers. In one bank, that failed in 1809, no accurate account was kept of the notes in circulation, but when it failed, there were not less than 648,000 in circulation, and their specie was found to be eighty-six dollars. Of two banks in Massachusetts, one was found to have thirty or forty dollars in specie, and the other none; and the whole of them had not as much specie as the paper issued by a single one. The first bank of the United States issued no notes below ten dollars, which, to a certain extent, controlled the issues of the local banks.

430. The Bank of the United States having failed to obtain a renewal of its charter from Congress, tried to get a charter from the State of Pennsylvania, but was refused from the preponderance of local interests, even though they offered a very large bribe. A banking mania began to declare itself in 1810, and the Legislature passed a law prohibiting any unincorporated companies from carrying on any of the operations of banking, but this was generally disregarded, and even companies incorporated for other purposes, issued notes. During the session of 1812-13, a bill to incorporate 25 banks passed both houses of the Legislature, by a majority of one in each house. The governor returned the bill with his objections. But the next session a bill to incorporate 41 banks with capitals amounting to 17 million dollars, passed by a large majority. The governor again returned it with objections, but two-thirds of each house having agreed to it, it became law on the 21st March, 1814, and under this Act 37 banks were actually instituted. The simultaneous operations of these manufactories of paper, produced its natural effect. The paper became depreciated, and caused a heavy pressure on the banks for specie. The Western and Southern Banks had been doing exactly the same, and the consequence was that in August and September,

1814, all the banks in the United States, except those in New England, stopped payment. In November, the paper of the best banks in Philadelphia was at 14 per cent. discount.

431. In October, 1814, during this general suspension, Mr. Dallas, secretary to the Treasury, recommended the establishment of a National Bank, with a capital of 50,000,000 dollars, of which 20 millions should be subscribed by government, and paid in 6 per cent. stock. The remainder to be subscribed by individuals, and of it 18 millions might be in stock. The bank was to be allowed to suspend specie payments, if the President thought it desirable. After many discussions and changes of plan, a bill for a bank passed the Legislature, but was vetoed by President Madison. The banks being freed by popular acquiescence from paying in specie, multiplied rapidly, and extended their operations, so that the notes of the city banks fell 20 per cent., and those of the country ones from 20 to 50 per cent., and specie so entirely disappeared from circulation, that even the fractional parts of a dollar were paid in small notes, and tickets issued by banks, corporations, and individuals. Prices rose correspondingly, and people were for a long time deluded into the belief that this was a real rise in their value. The government in vain tried to curb these issues. But the banks were independent, and rejected all attempts to establish some fixed medium of circulation. They thought that it was their duty to make as much profit as they could for themselves, and every effort and plan devised by the government to give uniformity to the currency failed.

432. The entire failure of all attempts at negotiation with the banks, which appeared to have adopted a suspension of cash payments *en permanence*, made the government once again bring forward the scheme of a National Bank. In his message to Congress on the 5th December, 1815, President Madison called the attention of the Legislature to the intolerable state of the currency, and said that if the State banks could not remedy it, the probable operation of a National Bank would merit consideration. So weak was the government, that it did not venture to condemn the suspension of cash payments, but it said that the continuance of it must be ascribed to a new cause. But now was manifested the wisdom of the founders of the constitution of the States, which declared that no State should make anything but gold and silver legal tender; if it had not been for this fundamental enactment, there can be little doubt that the States would either have gone back to their old paper issues, or the banks, by a permanent refusal to pay specie, would have produced the same effects. The delusion was the prevailing one in England at the same time, where the doctrines of the bullion report were now held in great contempt, by the majority of Parliament and the public. At length, however, returning sense dawned upon the public, and towards the close of 1815, the doctrine so generally taught and believed that it was not the paper currency which was depreciated, but specie which had risen in value, began to be abandoned.

433. In January, 1816, a bill was brought in to establish a Bank of the United States, and after very warm debates, was passed and approved by the President on the 10th of April. By Act

1816, c. 44, the Bank of the United States was established, with a capital of 35,000,000 dollars, in 350,000 shares of 100 dollars each. Seventy thousand shares were to be subscribed for and paid by the government of the United States, the remainder by individuals, amounting to 28,000,000 dollars, of which 7 millions were required to be in gold or silver, and the remaining 21 millions, either in gold or silver, or the funded debt of the States. The secretary to the Treasury might subscribe on behalf of the government for 7 million dollars, either in coin or in the funded debt of the Union. The government might redeem the funded debt subscribed to the capital of the bank, at certain rates, and the bank might sell it on certain conditions. The subscribers were to continue as a corporation till the 3rd March, 1836, and they were enabled to possess and hold in law, lands, rents, tenements, hereditaments, goods and chattels, and effects of whatsoever kind, nature, and quality, to an amount not exceeding in the whole 55 millions of dollars, including the amount of capital aforesaid. The usual provisions as to trading were inserted; and its bills obligatory, and of credit under seal, were to be transferable by indorsement, but they were not to be for a less sum than 5,000 dollars. All its bills and notes were to be payable to bearer on demand, except those for any sum not less than 100 dollars, payable to order of any individual, and at any time not exceeding 60 days from their date. The bank was to establish a branch of deposit and discount in Columbia, whenever any law of the United States ordered so, and also in any State in which 2,000 shares should be subscribed, or held, whenever, upon the application of the Legislature of the State, Congress might require it by a law. They might also establish any such branches at their own discretion, within the United States, or its territories. No note was to be for less than 5 dollars, and so long as they were payable on demand, they were to be received in payment of all debts due to the United States. It was forbidden to lend the government of the Union more than 500,000 dollars, or that of any State more than 50,000, or to foreign ones at all. All deposits of the money of the United States, in places in which the bank and its branches were established, were to be made in it, unless the secretary to the Treasury should at any time otherwise order and direct, and if he did so, he should immediately lay before Congress his reason for doing so. It was prohibited from suspending payments in specie of any of its obligations; and if it refused payment at any time of any of its obligations to their just holders, it should pay interest at 12 per cent. upon them. In consideration of its exclusive privileges, it should pay the Government of the United States one million and a-half of dollars. It was to exist for two years after the expiry of its charter, for the purpose of winding up its concerns. The same session a resolution was passed, declaring that after the 20th February, 1817, nothing but gold and silver, treasury notes, and the notes of specie-paying banks, *ought* to be received in payment of dues to the United States. The banks had got such a mastery over the community, that a person who wished to enforce payment of ten notes for 100 dollars each from a bank, could get no advocate to undertake the cause for many months.

When at last proceedings were begun, the president of the bank refused to appear. The Sheriff called a *posse comitatus* to his aid, and took the president, by force, before the Court. The bank refusing still to pay the notes, its doors were shut by the sheriff, but in defiance of that, it was soon opened again. In defiance of the resolution of Congress, the banks determined not to resume payment before the 1st July, 1817. At length the legislature of New York passed a law, that imposed a penalty of 12 per cent. on any bank that should not pay its notes in specie.

434. The bank of the United States commenced business at Philadelphia, on the 1st January, 1817, and the opinion held of its utility and operation by the government of the country well deserves our attention, because Sir Robert Peel attributed the subsequent crisis in America to its suppression; this will render it necessary to give these to our readers at some length, in order to enable them to judge whether Sir Robert Peel was borne out in his conclusions. The capital of the bank when it began business was 1,400,000 dollars in specie, and 14,000,000 in public stocks. A second instalment of 2,800,000 became due soon after. "But it is clear," said a contemporary pamphlet, "that the bank having commenced operations, and put its paper into circulation, could not enforce the payment of the specie part of the second and third instalments of the capital in *new acquisitions* of specie. They would be paid either in the notes of the bank, or in the specie which they would draw out of the bank, or with *cheques drawn on the credit of the discounts*, or not at all." But the directors did not wait until the second instalment was due, they passed a resolution in December, before any of the bank's notes were in circulation, authorizing discounts on a pledge of stock. By these means the *payment* of the second instalment was chiefly effected by the credit created on discounting on the pledge of stock; and instead of 2,800,000 of dollars in specie, there were only 324,000 paid in coin. A third instalment of 2,800,000 dollars in coin, and of 7,000,000 in public stock was due on the 1st of July, but a Committee of Congress said, "Of the 2,800,000 dollars which was to have been paid at the third instalment, it is believed that a very trifling amount was paid in coin, and as little of the funded debt, *but that nearly the whole were paid by the proceeds of notes discounted on stock.*" Thus the capital of the Bank of the United States, when all paid in, consisted of about 2,000,000 in specie, instead of 7,000,000, and of about 21,000,000 of funded debt, instead of 28,000,000, and of about 12,000,000 in the bank's own notes obtained by discounts on its own stock!

435. "The Directors," says the Report to Congress, "did not confine themselves to the amount prescribed in the resolution of December the 27th, that is, to the proportion of the coined part of the second instalment, but discounted to the full par value of the stock, *which was paid for by the proceeds of the same discounts*; and the discounts, the payment of the second instalment, the payment of the price to the owner, the transfer, and the pledge of the stock, were, as it is termed, simultaneous operations. All the discounts on stock after the 20th February, 1817, were made at the par value of the shares, which

enabled the discounter not only to pay the whole of the instalments, including the specie part, and the funded debt part, but also to draw out of the bank the amount which might have been paid in on his shares." Every species of gambling in the price of shares, immense loans to directors, and stock-jobbing followed. In January, a convention of delegates from the banks of New York, Philadelphia, Baltimore, Richmond, and Norfolk, met at Philadelphia, and resolved to resume specie payments on the 20th February, provided that the United States Bank should not demand payment for balances due to it from them until it had discounted for persons in New York to the amount of 2,000,000, in Philadelphia, 2,000,000, in Baltimore 1,500,000, and half a million in Virginia. One of the objects of the bank was to equalize the exchange throughout the Union, but this was done, not by making the local banks pay their notes in specie, but by a system of drawing and re-drawing, carried on between the head bank and its branches. The directors at some of the branches caused much embarrassment by their excessive issues. The discounts of the bank, which were 3,000,000 in February, increased to 20,000,000 in April, to 25,000,000 in July, and to 33,000,000 in October; and at the end of the year the "expansion" made by the United States Bank greatly exceeded the "contraction" made by the local banks. The committee of the Senate of Pennsylvania say, "Had the United States Bank been conducted with the discretion and wisdom which were so essential to so powerful a machine, its influence might have been productive of the most happy consequences. The public was aware that the currency of the State banks was still depreciated from excess, and that nothing but a further reduction of their issues could remove its unsoundness, and yet with this fact evident to the most limited capacity, the directors of the new bank fancied, that if they could only persuade the city banks to call that a sound currency, which was in reality an unsound one, the evil of depreciation could be cured, and they accordingly proposed to them to enter into an arrangement to resume specie payment on the 21st of February following. The city banks, sensible that their power over the community was so great, that few individuals would have the boldness to make large demands on them for coin, and relying on the forbearance that had hitherto been extended to them by an injured public, who had for two years and a-half been paying them 6 per cent. for their dishonoured bills, consented to the arrangement, and specie payments were nominally resumed on the appointed day. We say *nominally*, because in point of fact, a *bonâ fide* resumption did not take place, as is evident from the well-known circumstance that for a long time after that period *American*, as well as *foreign* coins, would command on the spot, a price in city bank notes, above their nominal value. Depreciation can as well result from the forbearance of the public to demand their rights, as from the refusal of the banks to pay their engagements; and the arrangement alluded to was not any real resumption of cash payments, but a mere change of one species of convertibility for another. No sooner, however, had the directors of the National Bank succeeded in the

desirable object of rendering depreciated paper an equivalent for their own convertible notes, than, instead of reflecting from an acquaintance with general principles, and from the experience of the past, that the channels of circulation could contain only, without depreciation, but a limited amount of paper credits; and that that amount was already in these channels, they began to add to the mass already redundant, by emissions of their own notes; and in the course of a few months added to the mass of bank loans an amount greatly beyond the reduction which had been made. By these means the currency, although nominally convertible, was depreciated below its former low state, and was thrown back instead of being advanced, on the road to restoration, and thus was rendered nugatory all the pain and embarrassment which the public had suffered from the former curtailments of the State banks."

436. "And," say the Committee of Congress, "the bank improvidently afforded a temptation to the Western Banks particularly, to extend their circulation of notes, by insisting on its branches paying out their own notes in preference to those of the State Banks, and on their delivering drafts on the eastern cities, whenever it could be done, to prevent the remittance of their own notes. The branch notes, and the drafts issued in consequence of these instructions, were swept away, the facility of remittance thus unwarily given, as well as by the ordinary balance of trade. A vacuum in the circulation was thus produced, which could be supplied only by the local notes, which were readily received by the offices of the Bank of the United States, and were retained by them as a fund upon which interest was paid by the State Banks. The committee are of opinion, that instead of conducting with the alleged rigor towards the State Banks, the Bank of the United States is liable to the more serious charge of having increased the amount of notes in circulation by its acceptance of them in those places where it was known they would not be redeemed in specie, and by making them, in the manner before-mentioned, the only circulating medium in that part of the country."

437. The bank went on in the same way the next year, by which time its discounts were 43,000,000. It issued its notes so fast that the officers of the bank could not sign them sufficiently quickly for the demand, and a bill was brought in to appoint extra officers for that purpose, but it was not carried. It sold a considerable part of its funded debt for specie, and then imported 7,000,000 dollars in specie. But as the issues were still excessive, specie was exported faster than it was imported by the bank. From Boston and Salem alone, 5,000,000 of dollars were exported in twelve months, and it was estimated, that from the whole Union, at least 12,000,000 were exported. And, notwithstanding its imports, the bank never had at one time, 3,000,000 dollars in its vaults. In July, it found itself in danger of bankruptcy, and it ordered, that by the 1st of November, there must be a reduction of discounts to the amount of 2,000,000 at Philadelphia, the same at Baltimore, 700,000 at Richmond, and 500,000 at Norfolk; and that the banks of Cincinnati and Columbia must pay their balances due. But

even this was not enough, and a reduction of another million was thought necessary at Philadelphia, a course indeed highly necessary, as the premium on Spanish dollars was already 10 per cent., and was considerable on other coins.

438. This sudden and violent contraction of discounts, to so large an amount in so short a time, caused widespread distress and ruin, which was further increased by an order not to receive at the head office, or branches, as deposits, any notes but those issued at the same office. Thus, every office of the bank dishonoured the paper of every other office of the same bank! This distress spread through the whole community, and plans were broached for creating an inconvertible paper money. Public opinion became hostile to the banks, and they were strongly denounced by the governors of several States. The Governor of New York said, "The embarrassments arising from the disordered state of our currency, have increased instead of diminishing, since I had the honour to address the Legislature on the subject. And unless efficient preventives are adopted, and suitable remedies applied, the evil will be in a state of progressive augmentation. A proposition to invest banks with a power of coining money would have no advocates, and yet it might not be so pernicious as the authority already granted of emitting bank notes." The Governor of Ohio said much the same. The Governor of Kentucky denounced the whole banking system, in the most vehement terms.

439. In November, 1818, a committee of Congress was appointed to investigate the affairs of the bank, and they reported in January, 1819, that it had violated its charter in four particulars,—in buying 2,000,000 of public debt; in not requiring the shareholders to pay the second and third instalments in coin, or public debt; in paying dividends to shareholders who were in arrear for calls; and in allowing persons to have more than their legal number of notes. Motions to cause a *scire facias* to issue, to have the charter forfeited, and to repeal it, were made, but rejected,—a very large number of members being shareholders in it. On the publication of this report, the shares immediately fell to 93, and the President resigned, and Mr. Cheves, of South Carolina, was elected to his place. This gentleman, three years afterwards, gave the shareholders an exposition of the affairs of the bank, and its mismanagement,—the length of which prevents us giving it entire. It details the extravagance of its issues, and the violent contraction it found necessary. Among other things, it said, that on the 1st of April, 1819, the bank at Philadelphia had only 126,745 dollars in its vaults; and the same day, upon striking a balance between it and the city banks, it owed them 79,125 dollars. On the 12th of the same month it had but 71,522 dollars, and it owed the city banks 196,418 dollars: the offices at New York and Boston were even in a worse state, and at the same time, it owed some English houses 900,000 dollars, which it was bound to pay immediately. He said that all the resources of the bank could not have sustained it another month; when, twenty-seven months before, it had commenced business with a free capital of 28,000,000 dollars. Its own officers defrauded it; and at Baltimore alone, it lost from this cause 1,671,221 dollars. Its ag-

gregate losses, arising out of operations which preceded the 6th of March, 1819, exceeded considerably 3,500,000 dollars. The dividends, during the same time, were 4,410,000. But of this 1,348,553 were received as interest on the public debt held by the bank, and the entire losses exceeded the entire profits by more than half a million dollars. It had imported many millions of specie at a great loss, which were entirely exhausted, *and were not yet paid for*, and the directors then expected that it would shortly have to stop payment. This event was universally expected both in and out of the bank. However, upon a general meeting of the directors being held on the 9th of April, strong measures were adopted, and in the space of seventy days it had not only righted itself, but was able to afford assistance to other institutions, which were ascertained to be solvent. But these measures were not effected without the most terrible distress. For a time the general question was not who had gone, but who had stood; confidence was so terribly shaken that even persons in good credit had to pay 36 per cent. for discounts.

440. In August, 1819, it was estimated that there were 20,000 persons daily seeking employment in Philadelphia; the case was very much the same in New York and Baltimore. A committee was appointed to investigate the situation of the manufacturers of Philadelphia. They reported that thirty trades, which employed 9,672 hands in 1816, only employed 2,137 persons in 1819. In Pittsburg, trades which employed 1,960 persons in 1815, employed only 672 persons in 1819. The distress was universal. The papers in the Western States were filled with descriptions of the general ruin and depreciation of the value of property. In one small State, Maryland, the *Gazette* of one day contained six columns of advertisements, by order of the Insolvent Commissioners. The Senate of Pennsylvania appointed a committee to examine into the causes of the distress. The committee reported on the 20th of January, 1820. It enumerated the evils, which were deep and general, and attributed them almost entirely to the abuses of banking, and most severely blamed the misconduct of the United States Bank. The House of Representatives also appointed a committee, which came to the same conclusion. The committee said, "In defiance of all experience, and in contempt of warnings almost prophetic, which were given to them at the time, the people of Pennsylvania, during an expensive war, and in the midst of great embarrassments, established forty-one new banks, with a capital of 17,500,000 dollars, and authority to issue bank notes to double that amount. In consequence of this most destructive measure, the inclination of a large part of the people, created by past prosperity, to live by speculation, and not by labour, was greatly increased, a spirit in all respects akin to gambling, prevailed; a fictitious value was given to all descriptions of property; specie was driven from circulation, as if by common consent; and all efforts to restore society to its natural condition were treated with undisguised contempt. * * * A new measure, however, remained to be adopted, that was really to close the last scene in the drama of error, the currency had already nearly vanished,

but was temporarily restored on the seaboard. The enormity of fictitious credit began to be felt; the abusive extent of paper issues was about to effect its own remedy in the State, when Congress created a *Corporation*, with authority to circulate upwards of 100,000,000 of a new paper medium, a corporation spreading its branches over the Union, with the baneful influence of the fabled upas."

441. To give an adequate picture of the universal ruin and misery, which at this period prostrated the whole country, would far exceed our limits, and yet it is not possible to form a proper conception of its extent, without presenting a large number of extracts from contemporary publications. Those who take an interest in the matter, we may refer to Mr. Gouge's *Short History of Paper Money and Banking in the United States*—Philadelphia, 1833, where they will find an ample series of extracts on the subject.

442. The effects of this terrible revulsion were felt in many States of the Union for several years afterwards. But the interest of the banking portion of the community was too powerful for the good sense of the authorities, and multitudes of fresh banks started on the debris of the old ones, and it would only weary our readers to enter into minute details. In 1824-25 a sympathetic speculation broke out, with the contemporaneous one in England, which of course was followed by an equivalent re-action, and nothing remarkable occurred to detain us till 1829.

443. In the message of President Jackson this year, December 8, 1829, the first attack by the government was made on the bank of the United States. The charter did not expire until 1836; but the President said that a measure of such importance could not be too soon presented to the deliberate consideration of the legislature and the public. "Both the constitutionality and the expediency of the law creating this bank are well questioned by a large portion of our fellow-citizens; and it must be admitted by all, *that it has failed in the great end of establishing a uniform and sound currency.*" This portion of his message was referred to the Committee of Ways and Means to report upon. This report was presented on the 13th of April, 1830, and was a very long and a very able document, taking the opposite view to the President's. It entered into a minute history of the establishment of a National Bank; the evil effects which the abolition of the first bank had upon the currency; the necessity for organizing a second one, which it maintained had fully answered its purpose. It deprecated in the most earnest manner the refusal of a grant of a renewal of the bank's charter.

444. In his message of December, 1830, the President again urged consideration of the bank question on Congress. On the 2nd February, 1831, Mr. Benton moved in the Senate to introduce a resolution that the charter of the bank of the United States ought not to be renewed. Leave, however, was refused by a majority of 23 to 20. In his message of 1831, the President again recommended the bank question to the notice of Congress. On the 9th of January, 1832, the president and directors of the bank presented

a memorial to the Senate, requesting a renewal of the charter, which was referred to a committee of five. This committee prepared a bill to renew the charter of the bank for fifteen years from the time of its expiry in 1836. The bill was introduced into the Senate by Mr. Webster, in an able speech. (*Gales and Seaton, Vol. VIII., p. 954.*) Mr. Benton strongly opposed the renewing of a charter to a single great corporation. He infinitely preferred having a larger number of moderate establishments. He saw the advantage of checking powers in banking governments, as well as in political governments. "The three Scottish banks had held each other in check, had proceeded moderately in all their operations, conducted their business regularly and prudently, and always kept themselves in a condition to face their creditors; while the single English bank, having no check from rival institutions, ran on in the wantonness of its own unbridled power, deluging the country, when it pleased, with paper, and filling it with speculation and extravagance, drawing in again when it pleased, and filling it with bankruptcy and pauperism; often transcending its limits, and twice stopping payment, and once for a period of twenty years. *There can be no question of the incomparable superiority of the Scottish banking system over the English banking system, even in a monarchy.* * * * In the peculiar excellence of the Scottish plan lies a few plain and obvious principles, closely related to Republican ideas. First. No exclusive privileges. Secondly, Three independent banks to check and control each other, and diffuse their benefits, instead of one to do as it pleased, and monopolize the moneyed power. Thirdly. *The liability of each stockholder for the amount of his stock on the failure of the bank to redeem its notes in specie.* Fourthly. The payment of a moderate interest to deposits. Upon these few plain principles, all of them founded in Republican notions, equal rights, and equal justice, the Scottish banks have advanced themselves to the first rank in Europe, have eclipsed the Bank of England, and caused it to be condemned in its own country, and have made themselves the model of all future banking institutions in Great Britain." After a great many amendments and minor divisions, the bill finally passed the Senate by a majority of 28 to 20. In the House of Representatives, the memorial of the bank was referred to the Committee of Ways and Means by a majority of 100 to 90. On the 10th of February, 1832, this Committee, by a majority, brought in a bill to prolong the charter for twenty years after 1836, with some modifications. On the 23rd February, 1832, Mr. Clayton moved for a select committee to examine into the affairs of the bank of the United States, which, after a very keen debate, was carried. The report of the majority of this committee was highly adverse to the management of the bank; it charged it with the same mismanagement and overtrading as in 1819, and in consequence of that a very severe contraction was then going on. On the 1st of March the bank had only 6,800,000 dollars in specie, 2,860,000 dollars in notes of other banks, and no funded debt to meet notes of its own, in circulation 23,717,000 dollars, deposits 17,050,000 dollars, and foreign debts 1,876,000, making an

aggregate of 42,643,000 dollars. The report of the majority of the committee recommended that the present bank should not be re-chartered, nor any other one chartered, until the public debt should have been paid off, and the revenue adjusted to the expenditure. The report of the minority, however, emphatically refuted the charges brought by that of the majority against the bank, in every particular. The bill sent down from the Senate was finally passed by a majority of 106 to 84, and on the 4th July was sent up to the President. The President, however, on the 10th July vetoed the bill as mischievous and unconstitutional, adducing many arguments of great cogency. On the message being sent to the Senate, and a motion made to declare the bill law, notwithstanding the veto of the President, which required a majority of two-thirds, the motion was lost by 22 to 19.

445. In his message to Congress in December, 1832, the language of the President regarding the bank became stronger and more decided: he even gave very strong hints as to its doubtful solvency. "Such measures as are within reach of the Secretary of the Treasury have been taken to enable him to judge whether the public deposits in that institution may be regarded as entirely safe; but as his limited power may prove inadequate to this object, I recommend the subject to the attention of Congress, under the firm belief that it is worthy of their serious investigation. An inquiry into the transactions of the institution, embracing the branches as well as the principal bank, seems called for by the credit which is given throughout the country to many serious charges, impeaching its character, and which, if true, may justly excite the apprehension that it is no longer a safe depository of the money of the people." In consequence of this portion of the message, the House of Representatives referred the question to the Committee of Ways and Means, to examine into the grounds of the doubts of the solvency of the bank. The majority of the committee reported entirely in its favour; it said that the total liabilities of the bank were \$7,800,000 dollars, and, if the evidence and statements of the directors could be relied on, its available and secure resources were 80,865,000 dollars. The report concluded by saying that if the evidence could be relied on, there could be no doubt of the entire soundness of the whole bank capital, after meeting all demands upon it; and it recommended a resolution that in the opinion of the house the government deposits might safely be continued in it, which was carried by a majority of 109 to 46.

446. At the Presidential election of 1832, the question of the renewal of the bank charter was one of the principal ones on which the election turned. General Jackson had always been inflexibly opposed to the monopoly of the bank. When he was elected, it was understood as the general verdict of the majority of the people against the continuance of the bank. Notwithstanding the vote of the House of Representatives in July, that the deposits of the United States might be safely continued in the bank, the Secretary to the Treasury withdrew them from the bank in September and October, 1833, and placed them in several of the State banks. In accordance with the law, the secretary laid before Congress a statement of his reasons for

so doing. In this he alleged not only that the approaching period of the termination of the charter imperatively required that such a thing should be done some time before its expiring, in order to prevent much inconvenience both to commerce and the government from such an event taking place on a sudden, but he brought forward the gravest charges of corruption and misconduct against the bank itself, which were corroborated by memorials from the government directors. He alleged that the bank had ostensibly petitioned for a renewal of its charter in 1832, four years before its expiring, on the ground that its operations were so extensive, that if the charter was not to be renewed, it was necessary, for the welfare of the country, that it should begin cautiously and gradually to contract them; and yet, since then, when the bank was still nearer the end of its existence, and when they had no reason to expect a renewal of the charter, they had increased their issues most extravagantly. In the end of December, 1830, its advances were 42,402,304 dollars, and at the end of 1831 they were 63,026,452 dollars, being an increase of 20,000,000, or nearly 50 per cent.; and by the end of May, 1832, they had still further increased to 70,428,070 dollars, being an increase of 28,026,766 dollars, or 66 per cent., in the space of sixteen months. There was ample evidence before the government that this extraordinary increase had taken place for political reasons, and in order to give the bank a greater hold over the community. They had spent immense sums in disseminating speeches, pamphlets, essays, and articles throughout the Union, and the other directors had systematically excluded the government directors from the knowledge of many of the most important of the bank's operations. The other directors of the bank were not slow in replying, and they well bespattered the President and his friends with mud, and countercharges of political hostility to the Bank. It is certainly possible, that there was an amount of truth in this, but yet the solid facts charged against the bank were unrefuted.

447. This very strong measure of removing the deposits from the Bank of the United States, gave rise, of course, to the most virulent and protracted controversy. The President had dismissed Mr. Duane, the Secretary of the Treasury, because he had declined to remove them. The debates began in the Senate on the 26th December, 1833, when Mr. Clay moved that the President, by dismissing a Secretary to the Treasury, because he conscientiously disapproved of removing the deposits, and appointing another to effect that purpose, had assumed a power over the Treasury of the United States, not granted to him by the constitution and laws, and dangerous to the liberties of the people; and that the reasons assigned by the Secretary to the Treasury for removing the deposits were unsatisfactory and insufficient. The conclusion of Mr. Clay's speech was followed by the most vehement outbursts of applause from the crowds which thronged the galleries and lobbies. The debate continued, with little interruption, for three months, at the end of which Mr. Clay modified his resolution, and proposed it thus, *resolved*, "That the President, in the late executive proceedings in relation to the public revenue, has assumed upon himself

authority and power not conferred by the constitution and laws, but in derogation of both;" and this resolution was carried by 26 to 20. To this very serious resolution the President returned an energetic protest, showing its unconstitutionality, and quoting resolutions from the legislatures of the States, in accordance with his own views. The President demanded that his protest should be entered in the journals of the Senate. Upon this, a debate began ten times more furious than the preceding one; and after nearly a month, it was resolved by a majority of 27 to 16 that the protest asserted powers on behalf of the President, which were inconsistent with the constitution and the just authority of Congress, that it was a breach of the privileges of the Senate, and should not be entered in their journals. The debates in the House of Representatives were equally animated. But the will of the President finally prevailed, notwithstanding all the speeches and resolutions of both houses of Congress; and a bill was eventually passed for regulating the deposits in the State banks.

448. But the bank and its friends were by no means inclined to give up the struggle. On the 18th of March, 1834, Mr. Webster moved for leave to bring in a bill to continue for six years, the Act incorporating the subscribers to the bank of the United States. He described the universal distress the country was suffering under, which he attributed entirely to the removal of the deposits from the United States Bank. He dwelt upon the extreme importance of credit in modern commerce. "Commercial credit is the creation of modern times, and belongs in its highest perfection, only to the most enlightened and best-governed nations. In the primitive ages of commerce, article is exchanged for article, without the use of money or credit. This is simple barter. But in its progress a symbol of property, a common measure of value is introduced, to facilitate the exchanges of property, and this may be iron, or any other article fixed by law, or by consent, but has generally been gold and silver. This, certainly, is a great advance beyond simple barter, but no greater than has been gained, in modern times, by proceeding from the mere use of money to the use of credit. Credit is the vital air of the system of modern commerce. *It has done more, a thousand times, to enrich nations, than all the mines of all the world.* It has excited labour, stimulated manufactures, pushed commerce over every sea, and brought every nation, every kingdom, and every small tribe among the races of men, to be known to all the rest; it has raised armies, equipped navies, and triumphing over the gross power of mere numbers; it has established national superiority on the foundation of intelligence, wealth, and well-directed industry. Credit is to money what money is to articles of merchandize. * * * I hold the immediate convertibility of bank notes into specie to be an indispensable security to their retaining their value; but consistently with this security, and indeed, founded upon it, credit becomes the great agent of exchange. It is allowed that it increases consumption, by anticipating products; and that it supplies present wants out of future means. And as it circulates commodities without the actual use of gold and silver, it not only saves much by doing away

with the constant transportation of the precious metals from place to place, but accomplishes exchanges with a degree of dispatch and punctuality not otherwise to be obtained. All bills of exchange, all notes running upon time, as well as the paper circulation of the banks, belong to the system of commercial credit. * * *

It is very true that commercial credit, and the system of banking as a part of it, does furnish a substitute for capital." Nothing, however, eventually came of this motion, as the public mind was so distracted and divided upon the subject, that it was impossible to agree upon any course. The will of the President prevailed over the votes of both houses of Congress, and the charter of the bank was not renewed; but it obtained one as an ordinary State bank from the legislature of Pennsylvania, and thenceforth, during the short remainder of its existence, it was no more than a common State bank.

449. In December, 1834, the President having conquered all opposition, was still more emphatic in his denunciation of the bank. "Circumstances make it my duty to call the attention of Congress to the bank of the United States. Created for the convenience of the government, that institution has become the scourge of the people. Its interference to postpone the payment of a portion of the national debt, that it might retain the public money appropriated for that purpose, to strengthen it in a political contest, the extraordinary extension and contraction of its accommodations to the community—its corrupt and partisan loans—its exclusion of the public directors from a knowledge of its most important proceedings—the unlimited authority conferred on the President to expend its funds in hiring writers, and procuring the execution of printing, and the use made of that authority—the retention of the pension-money and books, after the selection of new agents—the groundless claims to heavy damages in consequence of the protest of the bill drawn on the French government, have through various channels been laid before Congress. Immediately after the close of the last session, the bank, through its President, announced its ability and readiness to abandon the system of unparalleled curtailment, and the interruption of domestic exchanges which it had practised upon from the 1st of August, 1833, to the 30th of June, 1834, and to extend its accommodations to the community. The grounds assumed in this annunciation amounted to an acknowledgment that the curtailment in the amount to which it had been carried, was not necessary to the safety of the bank, and had been persisted in merely to induce Congress to grant the prayer of the bank in its memorial relative to the removal of the deposits, and to give it a new charter. They were substantially a confession that all the real distresses which individuals and the country had endured for the preceding six or eight months, had been needlessly produced by it, with the view of affecting, through the sufferings of the people, the legislative action of Congress. It is a subject of congratulation that Congress and the country had the virtue and firmness to bear the infliction; that the energies of our people soon found relief from this wanton tyranny, in vast importations of the precious metals from almost every part of the world, and at the close of this tremendous

effort to control the bank, our government found itself powerless, and no longer able to loan out its surplus means. The community had learnt to manage its affairs without its assistance, and trade had already found new auxiliaries, so that on the 1st of October last the extraordinary spectacle was presented of a National Bank, more than one-half of whose capital was either lying unproductive in its vaults, or in the hands of foreign bankers."

450. One great object of President Jackson and the party with which he acted was to abolish the small notes, which circulated throughout the Union, for a dollar, and even half-a-dollar, and to substitute gold and silver. In his message of 1835, he again recurs to the bank. "Connected with the condition of the finances, and the flourishing state of the country in all its branches of industry, it is pleasing to witness the advantages which have already been derived from the recent law regulating the value of the gold coinage. These advantages will be more apparent in the course of the next year, when the branch mints authorized to be established in North Carolina, Georgia, and Louisiana, shall have gone into operation. Aided, as it is hoped they will be, by further reforms in the banking systems of the States, and by judicious regulations on the part of Congress in relation to the custody of the public moneys, it may be confidently anticipated that the use of gold and silver as a circulating medium, will become general in the ordinary transactions connected with the labour of the country. The great desideratum in modern times, is an efficient check upon the power of banks, preventing that excessive issue of paper, whence arise the fluctuations in the standard of value which render uncertain the rewards of labour. It was supposed by those who established the bank of the United States, that from the credit given to it by the custody of the public moneys and other privileges, and the cautions taken to guard against the evils which the country had suffered in the bankruptcy of many of the State institutions of that period, we should derive from that institution all the security and benefits of a sound currency, and every good end that was attainable under that provision of the constitution, which authorizes Congress alone to coin money, and regulate the value thereof. But it is scarcely necessary now to say that these anticipations have not been realized. After the extensive embarrassments, recently produced by the bank of the United States, from which the country is now recovering, aggravated as they were by pretensions to power, which defied the public authority, and which, if acquiesced in by the people, would have changed the whole character of our government, every candid and intelligent individual must admit that for the attainment of the great advantages of a sound currency, we must look to a course of legislation radically different from that which created such an institution. * * *

The experience of another year has confirmed the utter fallacy of the idea that the bank of the United States was necessary as a fiscal agent of the government."

451. In 1836, the President again entered very fully into the question of the currency, and a national bank. "It is apparent from the whole

context of the constitution, as well as the history of the times, which gave birth to it, that it was the purpose of the convention to establish a currency consisting of the precious metals. These, from their peculiar properties, which rendered them the standard of value in all other countries, were adopted in this, as well to establish its commercial standard in reference to foreign countries, by a permanent rule, as to exclude the use of a mutable medium of exchange, such as of certain agricultural commodities, recognized by the statutes of some States as a tender for debts, or the still more pernicious expedient of a paper currency. The last from the experience of the evils of the issues of paper during the revolution, had become so justly obnoxious, as not only to suggest the clause in the constitution forbidding the emission of bills of credit by the States, but also to produce that vote in the convention, which negatived the proposition to grant power to Congress to charter corporations; a proposition well understood at the time as intended to authorize the establishment of a national bank, which was to issue a currency of bank notes, as a capital to be created to some extent out of government stocks. Although this proposition was refused by a direct vote of the convention, the object was afterwards in effect obtained by its ingenious advocates, through a strained construction of the constitution. The debts of the Revolution were funded at prices which formed no equivalent, compared with the nominal amount of the stock, and under circumstances which exposed the motives of some of those who participated in the passage of the Act, to some distrust. The fact that the value of the stocks was greatly enhanced by the creation of the bank, that it was well understood that such would be the case, and that some of the advocates of the measure were largely benefited by it, belong to the history of the times, and are well calculated to diminish the respect which might otherwise have been due to the action of the Congress which created the institution. On the establishment of a national bank, it became the interest of its creditors that gold should be superseded by the paper of a bank, as a general currency. A value was soon attached to the gold coins, which made their exportation to foreign countries as a mercantile commodity, more profitable than their retention and use at home, as money. It followed as a matter of course, if not designed by those who established the bank, that the bank became in effect a substitute for the Mint of the United States. Such was the origin of a national bank currency, and such was the beginning of those difficulties which now appear in the excessive issues of the banks incorporated by the various states. Although it may not be possible by any legislative means within our power, to change at once the system which has been introduced, and has received the acquiescence of all portions of the country, it is certainly our duty to do all that is consistent with our constitutional obligations, to prevent the mischiefs which are threatened by its undue extension. That the efforts of the fathers of our government to guard against it by a constitutional provision were founded on an intimate knowledge of the subject, has been frequently attested by the bitter experience of the country.

The same course which led them to refuse their sanction to a power authorizing the establishment of incorporation for banking purposes, now exists in a much stronger degree to urge us to exert the utmost vigilance in calling into action the means necessary to correct the evils resulting from the unfortunate exercise of the power; and it is to be hoped that the opportunity of effecting this great good will be improved before the country witnesses new scenes of embarrassment and distress. Variableness must ever be the characteristic of a currency, of which the precious metals are not the chief ingredients, or which can be expanded or contracted without regard to the principles that regulate the value of those metals as a standard in the general trade of the world. With us, bank issues constitute such a currency, and must ever do so until they are made dependant on those just proportions of gold and silver, as a circulating medium, which experience has proved to be necessary, not only in this, but in all other commercial countries. When those proportions are not infused into the circulation, and do not control it, it is manifest that prices must vary according to the tide of bank issues, and the value and stability of property must stand exposed to all the uncertainty which attends the administration of institutions that are constantly liable to the temptations of an interest distinct from that of the community in which they are established. The progress of an expansion, or rather a depreciation of the currency, by excessive bank issues, is always attended by a loss to the labouring classes. This portion of the community have neither time nor opportunity to watch the ebbs and flows of the money market. Engaged from day to day in their useful toils, they do not perceive that although their wages are nominally the same, or even somewhat higher, they are greatly reduced in fact by the rapid increase of a spurious currency, which, as it appears to make money abound, they are at first inclined to consider a blessing. It is not so with the speculator, by whom this operation is better understood, and is made to contribute to his advantage. It is not until the prices of the necessities of life become so dear, that the labouring classes cannot supply their wants out of their wages, that the wages rise, and gradually reach a justly proportioned rate to that of the products of their labour. When thus by the depreciation, in consequence of the quantity of paper in circulation, wages as well as prices become exorbitant, it is soon found that the whole effect of the adulterations is a tariff on our home industry, for the benefit of the countries where gold and silver circulate, and maintain uniformity and moderation in prices. It is then perceived that the enhancement of the price of land and labour produces a corresponding increase in the price of products, until these products do not sustain a competition with similar ones in other countries, and thus both manufactured and agricultural productions cease to bear exportation from the country of the spurious currency, because they cannot be sold for cost. This is the process by which specie is banished by the paper of the banks. Their vaults are soon exhausted to pay for foreign commodities, the next is a stoppage of specie payments,—a total degradation of paper as a currency, un-

usual depression of prices, the ruin of debtors, and the accumulation of property in the hands of creditors, and cautious capitalists. It was in view of these evils, together with the dangerous power wielded by the bank of the United States, and its repugnance to our constitution, that I was induced to exert the power conferred upon me by the American people to prevent the continuance of that institution. But although various dangers to our republican institutions have been obviated by the failure of that bank to extort from the government a renewal of its charter, it is obvious that little has been accomplished except a salutary change of public opinion towards restoring to the country the sound currency provided for in the constitution. In the Acts of several of the States prohibiting the circulation of small notes, and the auxiliary enactments of Congress at the last session, forbidding their reception or payment on public account, the true policy of the country has been advanced, and a larger portion of the precious metals infused into our circulating medium. These measures will probably be followed up in due time by the enactment of State laws, banishing from circulation bank notes of still higher denominations; and the object may be materially promoted by further Acts of Congress, forbidding the employment as fiscal agents, of such banks as continue to issue notes of low denominations, and throwing impediments in the way of the circulation of gold and silver. The effects of the extension of bank credits, and over issues of bank paper, have been strikingly illustrated in the sale of public lands. From the returns made by the various registers and receivers in the early part of last summer, it was perceived that the receipts arising from the sales of the public lands were increasing to an unprecedented amount. In effect, however, these receipts amounted to nothing more than credits in bank. The banks let out their notes to speculators, they were paid to the receivers, and immediately returned to the banks, to be sent out again and again, being mere instruments to transfer to speculators the most valuable public land, and pay the government by a credit on the books of the banks. *These credits on the books of some of the Western banks, usually called deposits,* were already greatly beyond their immediate means of payment, and were rapidly increasing. Indeed, each speculation furnished means for another, for no sooner had one individual, or company, paid in the notes, than they were immediately lent to another for a like purpose, and the banks were extending their business and their issues so largely, as to alarm considerate men, and render it doubtful whether these bank credits, if permitted to accumulate, would ultimately be of the least value to the government. The spirit of expansion and speculation was not confined to the deposit banks, but pervaded the whole multitude of banks throughout the Union, and was giving rise to new institutions to aggravate the evil. The safety of the public funds, and the interest of the people generally, required that these operations should be checked, and it became the duty of every branch of the general and State governments, to adopt all legitimate and proper means to produce that salutary effect. Under this view of my duty, I directed

the issuing of the order which will be laid before you by the Secretary of the Treasury, requiring payment for the public lands sold, to be made in specie, with an exception until the 15th of the present month, in favour of actual settlers. This measure has produced many salutary consequences. It checked the career of the western banks, and gave them additional strength in anticipation of the pressure, which has since pervaded our eastern as well as the European commercial cities. By preventing the extension of the credit system, it measurably cut off the means of speculation, and retarded its progress in monopolizing the most valuable of the public lands. It has tended to save the new States from a non-resident proprietorship, one of the greatest obstacles to the advancement of a new country, and the prosperity of an old one. It has tended to keep open the public lands for entry by emigrants at government prices, instead of being compelled to purchase of speculators at double or treble prices. And it is conveying into the interior large sums in silver and gold, there to enter permanently into the currency of the country, and place it on a firmer foundation. * * * Experience continues to realize the expectations entertained as to the capacity of the State banks to perform the duties of fiscal agents for the government, at the time of the removal of the deposits. It was alleged by the advocates of the Bank of the United States, that the State banks, whatever might be the regulations of the Treasury department, could not make the transfers required by the government, or negotiate the domestic exchanges of the country. It is now well ascertained that the real domestic exchanges, performed through discounts, by the United States Bank, and its 25 branches, were at least one-third less than those of the deposit banks for an equal period of time; and if a comparison be instituted between the amounts of service rendered by these institutions, on the broader basis which has been used by the advocates of the United States Bank, in estimating what they consider the domestic exchanges transacted by it, the result will be still more favourable to the deposit banks. The whole amount of public money transferred by the Bank of the United States in 1832, was 16,000,000 dollars. The amount transferred and actually paid by the deposit banks, in the year ending the 1st of October last, was 39,319,899 dollars; the amount transferred and paid between that period and the 6th of November was 5,399,000 dollars, and the amount of transfer warrants outstanding on that day was 14,450,000 dollars, making an aggregate of 59,168,894 dollars. These enormous sums of money first mentioned have been transferred with the greatest promptitude and regularity, and the rates at which the exchanges have been negotiated, previously to the passage of the Deposit Act, were generally below those charged by the Bank of the United States. Independently of these services, which are far greater than those rendered by the United States Bank and its twenty-five branches, a number of the deposit banks have, with a commendable zeal to aid in the improvement of the currency, imported from abroad, at their own expense, large sums of the precious metals for coinage and circulation. In the same manner have nearly all the

predictions turned out in respect to the effect of the removal of the deposits—a step unquestionably necessary to prevent the evils which it was foreseen the bank itself would endeavour to create in a final struggle to procure a renewal of its charter. It may be thus, too, in some degree, with the further steps which may be taken to prevent the excessive issue of other bank paper; but it is to be hoped that nothing will now deter the federal and state authorities from the firm and vigorous performance of their duties to themselves and the people in this respect. . . . The conduct and present condition of that bank, and the great amount of capital vested in it by the United States, require your careful attention. Its charter expired on the 3rd day of March last, and it has now no power but that given in the 21st section,—“to use the corporate name, style, and capacity for the purpose of suits, for the final settlement and liquidation of the affairs and accounts of the corporation, and for the sale and disposition of their estate, real, personal, and mixed, but not for any other purpose, or in any other manner whatsoever, nor for a period exceeding two years after the expiration of the said term of incorporation.” Before the expiration of the charter, the stockholders of the bank obtained an act of incorporation from the Legislature of Pennsylvania, excluding only the United States. Instead of proceeding to wind up their concerns, and pay over to the United States the amount due on account of the stock held by them, the president and directors of the old bank appear to have transferred the books, papers, notes, obligations, and most or all of its property, to this new corporation, which entered upon business as a continuation of the old concern. Amongst other acts of questionable validity, the notes of the expired corporation are known to have been used as its own, and again put in circulation. That the old bank had no right to issue or reissue its notes after the expiration of its charter, cannot be denied, and that it could not confer any such right on its substitute, any more than exercise it itself, is equally plain. In law and honesty, the notes of the bank in circulation, at the expiration of its charter, should have been called in by public advertisement, paid up as presented, and, together with those on hand, cancelled and destroyed. Their re-issue is sanctioned by no law, and warranted by no necessity. If the United States be responsible in their stock for the payment of these notes, their re-issue by the new corporation, for their own profit is a fraud on the government. If the United States is not responsible, then there is no legal responsibility in any quarter, and it is a fraud on the country. They are the redeemed notes of a dissolved partnership, but contrary to the wishes of the retiring partner, and without his consent, are again re-issued and circulated. . . . The lessons taught by the Bank of the United States cannot well be lost upon the American people. They will take care never again to place so tremendous a power in irresponsible hands; and it will be fortunate if they seriously consider the consequences which are likely to result on a smaller scale from the facility with which corporate powers are granted by the State governments.” Thus ended the era of a central national bank in the United States.

452. We have already shown, in the sketch of the history of Banking in England, that the years 1834-35-36 were years of great commercial speculation, arising, very greatly, from the extremely plentiful harvests, and the rapid multiplication of joint-stock banks. We have just seen that the very same thing took place in the United States. The Bank of the United States took the lead in this race of evil. We have already shown how it increased its issues in these years, partly as alleged by the President, for party purposes: but the other banks did exactly the same thing. The consequence was a general spirit of wild speculation in every conceivable thing. The year 1837 began with a very severe pressure on the money market in London; and this was not long in extending itself to America. In the beginning of this year, however, we may note that the Senate ordered the resolution of censure which it had passed on President Jackson to be expunged from its books, declaring it to be arbitrary and contrary to the constitution, and unjust and unmerited. To show how banking had increased at this time, the Report of the Secretary to the Treasury showed that in 1834 the circulation of the banks in the Union was 94,000,000 dollars; in 1836 it was 140,000,000 dollars; the total liabilities of the banks in 1834 were 195,000,000 dollars; in 1836 they were 330,000,000. In March, the difficulties in London were supposed to have been got over, and attention began to be strongly directed to the United States, as it was known that English persons who had sent their money over to be invested there, when it was cheap in London, were now calling it in as rapidly as they could. It was fully expected that this would cause great distress in New York, and all the other trading cities in the United States. (*The Times*, March 8, 1837). And the same doubts were then beginning to press upon the Americans. They were then becoming alarmed as to how they were to meet the payments due for the enormous importations of the preceding year. About the end of March a number of large American houses were obliged to apply for assistance to the Bank of England, which was granted to them.

453. While a crisis was generally expected on both sides of the Atlantic, President Jackson retired from office, and in his farewell address to the citizens of the United States he took occasion to reiterate his solemn warning of the danger of the American system of paper currency. “In renewing the conflicts which have taken place between different interests in the United States, and the policy pursued since the adoption of our present form of government, we find nothing that has produced such deep-seated evil as the course of legislation in relation to the currency. The constitution of the United States unquestionably intended to secure to the people a circulating medium of gold and silver; but the establishment of a National Bank by Congress, with the privilege of issuing paper money receivable in the payment of the public dues, and the unfortunate course of legislation by the several States on the same subject, drew from general circulation the constitutional currency, and substituted one of paper in its place.” He then entered into a minute account of the evils caused by the arbitrary increase and contraction of a paper

currency, the gambling spirit evoked by the fluctuations in value of a paper currency, and the ruin caused by it. "Recent events have proved that the paper money system of this country may be used as an engine to undermine your free institutions; and that those who desire to engross all power in the hands of the few, and to govern by corruption or force, are aware of its power, and prepared to employ it. Your banks now furnish your only circulating medium, and money is plenty or scarce, according to the quantity of notes issued by them. While they have capitals not greatly disproportioned to each other, they are competitors in business, and no one of them can exercise dominion over the rest; and although in the present state of the currency, these banks may and do operate injuriously upon the habits of business, the pecuniary concerns and the moral tone of society, yet from their number and dispersed situation, they cannot combine for the purposes of political influence, and whatever may be the dispositions of some of them, their power of mischief must necessarily be confined to a narrow space, and felt only in their immediate neighbourhoods. But when the Charter of the Bank of the United States was obtained from Congress, it perfected the schemes of the paper system, and gave its advocates the position they have struggled to obtain, from the commencement of the federal government down to the present hour. The immense capital, the peculiar privileges bestowed upon it, enabled it to exercise despotic sway over the other banks in every part of the country. From its superior strength, it could seriously injure, if not destroy, the business of any one of them which might incur its resentment; and it openly claimed for itself the power of regulating the currency throughout the United States. In other words, it asserted, (and it undoubtedly possessed), the power to make money plenty or scarce at its pleasure, at any time, and in any quarter of the Union, by controlling the issues of other banks, and permitting an expansion, or compelling a general contraction of the circulating medium, according to its own will. The other banking institutions were sensible of its strength, and they soon generally became its obedient instruments, ready at all times to execute its mandates; and, with the banks, necessarily went also that numerous class of persons in our commercial cities, who depend altogether on bank credits for their solvency and means of business, and who are therefore obliged, for their own safety, to propitiate the favour of the money power by distinguished zeal and devotion to its service. The result of the ill-advised legislation which established this great monopoly, was to concentrate the whole monied power of the Union, with its boundless means of corruption, and its numerous dependents, under the direction and command of one acknowledged head, thus organizing this particular interest as one body, and securing to it unity and concert of action throughout the United States, and enabling it to bring forward upon any occasion its entire and undivided strength, to support or defeat any measure of the government. In the hands of this formidable power, thus perfectly organized, was also placed unlimited dominion over the amount

of the circulating medium, giving it the power to regulate the value of property and the fruits of labour in every quarter of the Union, and to bestow prosperity, or bring ruin upon any city or section of the country, as might best comport with its own interest or policy.

"We are not left to conjecture how the monied power, thus organized, and with such a weapon in its hands, would be likely to use it. The distress and alarm which pervaded and agitated the whole country, when the Bank of the United States waged war upon the people, in order to compel them to submit to its demands, cannot yet be forgotten. The ruthless and unsparing temper with which whole cities and communities were oppressed, individuals impoverished and ruined, and a scene of cheerful prosperity suddenly changed into one of gloom and despondency, ought to be indelibly impressed on the memory of the people of the United States. If such was its power in a time of peace, what would it not have been in a season of war, with an enemy at your doors. No nation but the freemen of the United States could have come out victorious from such a contest; yet, if you had not conquered, the government would have passed from the hands of the many to that of the few; and this organized money power, from its secret conclave, would have dictated the choice of your highest officers, and compelled you to make peace or war, as best suited their own wishes. The forms of your government might for a time have remained; but its living spirit would have departed from it.

"The distress and sufferings inflicted upon the people by the bank, are some of the fruits of that system of policy, which is continually striving to enlarge the authority of the federal government beyond the limits fixed by the constitution. The powers enumerated in that instrument do not confer on Congress the right to establish such a corporation as the Bank of the United States; and the evil consequences which followed may warn us of the danger of departing from the true rule of construction, and of permitting temporary circumstances, or the hope of better promoting the public welfare, to influence in any degree our decisions upon the extent of the authority of the general government. Let us abide by the constitution as it is written, or amend it in the constitutional mode if it is found to be defective. The severe lessons of experience will, I doubt not, be sufficient to prevent Congress from again chartering such a monopoly, even if the constitution did not present an insuperable objection to it."

454. The crisis in America, which had long been foreseen by every rational man who paid attention to its commercial dealings during the preceding twelve months, began at New Orleans, at the beginning of March, when several houses were obliged to apply to the banks there for assistance. About the 18th of that month the houses of New York connected with those in the South began to fail, and by the end of the month, the failures had become general throughout the Union. The Bank of the United States was applied to, to remit coin to Europe, to issue post notes payable at Philadelphia, and bonds payable at some distant date in London, Paris, and Amsterdam. The bank promptly agreed to assist the mer-

chants; and the banks of New York agreed to co-operate with the United States Bank, and increase their discounts by the aggregate sum of 1,500,000 dollars. The Philadelphia banks did the same. These new securities were sent over to England and favourably received. By the beginning of April the failures in New York reached 100, and their amount was not less than £3,000,000. Immense quantities of these bonds were remitted, and soon after the people in America began to think that they were not so advantageous as had been supposed. The bonds were sold at prices equivalent to borrowing at two per cent. per month, and the bank of the United States had got possession of all the best New York paper which fell due during the next six months, of which it would demand payment in specie. The banks in New York began to organize measures to resist this demand for specie. In New Orleans, discount on the best paper rose to five or six per cent. per month. "The distress and panic," says a contemporary writer, "now pervading the United States, have never been equalled since the Revolutionary war. * * * The accounts from every quarter of the union are of the same gloomy character;—every mail adds to the list of failures. In this city, during the month of April, about 250 houses have already suspended payment: it will be fortunate if the number is not doubled during the next thirty days."

455. At length the crisis burst at New York on the 8th of May. The shares of the Bank of the United States fell from 118 to 98 in a few days; and those of other banks in a greater ratio. A run began on the Mechanics', and the Dry Dock Banks;—the former stood, but the latter, after paying away 100,000 dollars, stopped. The three banks in Buffalo stopped. The entire body of banks then in New York, after full deliberation, resolved to suspend specie payments together; and an Act was hurried through the Legislature, which was then sitting, to legalize the suspension. This measure produced great instant relief, and was immediately followed by all the banks in the Union, about 700 in number, the Bank of the United States among the rest. In New York the paper of the city banks fell to ten or twelve discount. This depreciation, of course, extended rapidly throughout the country. The notes in Mississippi fell to a discount of 25 per cent. compared with the city notes of New Orleans; and to 45 per cent. compared with specie. The distress and confusion caused by this state of things caused somewhat of a re-action in favour of a national bank.

456. A very general demand arose that the President should summon an early meeting of Congress to consider what was to be done, which the President, having resisted for some time, was obliged to do. Congress was summoned to meet in September. The message, of course, was entirely occupied with the commercial crisis, which the President attributed to the excessive issues of banks, both in England and America. He decidedly discouraged the idea of founding another national bank, and said that experience disproved the idea that the existence of a national bank would have prevented the crisis. The Bank of the United States did not, and could

not, prevent former and similar embarrassments, and, notwithstanding the strength it had been supposed to acquire under its present charter, had it either checked other institutions, or been able to save itself. The question of a national bank was of course brought up; but a majority of 123 to 91 in the House of Representatives voted against it.

457. The Bank of the United States having been defeated in its attempt to obtain a renewal of its charter from Congress, applied for and obtained one from the Legislature of Pennsylvania. The stockholders were incorporated,—except the United States,—and allowed to make up their capital to its former amount by other subscriptions; but the charter conferred upon them novel and most dangerous powers, namely, dealing in exchanges and merchandize;—that is, the directors were allowed to apply the money of the stockholders or depositors in any commercial speculation they chose. At this period, finding that their bonds had been so well received in England, they determined to send over agents of their own to manage their exchange and mercantile speculations. This was viewed with much jealousy in the city.

458. Many meetings were held in the States by the banks with a view to resume payments in cash. The Bank of the United States made an attempt to resume cash payments in August, in order to obtain the government deposits, in terms of the law which enacted that they should be placed in the nearest specie paying bank, but the entanglements and engagements of this bank were so great that it was found to be quite impossible; and thus Mr. Biddle's expected triumph over the executive was frustrated. In the month of January, 1838, things became still worse in New England;—several of the banks in Boston became insolvent, and an association was formed, which refused to take the notes of a number of the others; the discount on the bills and notes fell still lower,—in some cases as much as 70 and 80 per cent. An investigation into the affairs of the Franklin Bank, showed the statements and figures put forward by many of the banks were fraudulent. To show how extravagantly the Massachusetts banks had been over-trading, the following figures exhibit the specie they held as compared to their issues:—In the county of Suffolk the banks had 1 dollar in specie to 4 in paper; in Middlesex, 1 to 11; in Worcester, 1 to 18; in Franklin, 1 to 17; in Hampshire, 1 to 41; in Hampden, 1 to 19; in Berkshire, 1 to 25; in Norfolk, 1 to 19; in Bristol, 1 to 19; in Plymouth, 1 to 16; in Barnstable, 1 to 16; and in Nantucket, 1 to 11; and the investigations that took place shewed that a number of the banks were in the habit of loaning a quantity of specie to each other to make up the quantity required by law, when the commissioners came to inspect the state of the bank.

459. In March, 1838, the New York banks having been for some time acting on a system of severe curtailment, the exchanges turned in favour of America, and left a large profit on the import of gold. The Bank of England, which had only just escaped a very severe crisis itself, adopted the astounding measure of exporting a million of gold to the United States. The New

York banks, meantime, had been making the most vigorous efforts to obtain specie. They had reduced their liabilities from 26,480,000 dollars on the 1st of January, 1837, to 12,920,000 dollars on the 1st of January, 1838; and they sold every description of security which had come into their hands. To show the rash and dangerous character of their system, one bank alone, at a single public sale, put up 6,378 shares in twenty-two different companies. Advances had been made in 1836, upon the security of shares, to the amount of 20 per cent. above their par value, and as they then sold for 40 per cent. below that, it was calculated that this one bank would not get out of that single sale with a loss less than 800,000 dollars. And the case of this bank was more or less that of many others. It was, however, determined, if possible, to resume payments on the 10th of May.

460. At the same time the extraordinary operations of Biddle's Bank (as the United States Bank was called,) began to excite, in the minds of mercantile men, great doubts of its stability. The reports from various branches disclosed that a very large portion of its assets were of a bad and doubtful nature, and it began new issues of paper, payable in distant parts of the Union, without any authority beyond a State charter. Immense quantities of obligations were sent over by every mail to London to the agency there, promising about double the rate of interest obtainable on the best English securities. The consequence was that numbers of people were tempted to buy these up, trusting to the supposed magnitude of the capital.

461. Up to this time all the banks in the States were chartered, and no private or unincorporated persons were allowed to carry on the business of banking. In 1829 the numerous bank failures which had occurred in the Union since 1816, induced the Legislature of New York to organize what was called "a safety fund." By this Act all monied corporations, having banking powers, created in future, or whose charters should be renewed or extended, were ordered to pay to the treasurer of the State, every 1st of January, a sum equal to one half per cent. of its capital stock, and such payments were to be continued until they had paid in 3 per cent. of their capital. This money was to remain the property of the corporation, but was to be invested by the treasurer, and the annual profits paid over to the corporation. This fund was to be applied to the payment of the notes of any one of the corporations which might become insolvent, and not leave sufficient to discharge its notes after the sale of its assets. But the State banks having been so grossly mismanaged, and led to so much distress, it was now resolved, by Act, April 18, 1838, to open the business of banking to others besides incorporated banks. These companies and firms were called "Monied Corporations," "Banking Associations," and "Bankers," which were all regulated by very stringent enactments. With regard to the chartered banks, it was enacted, that they should not make dividends except from the surplus profits arising out of their business; pay to the stockholders, or in any way withdraw any part of the capital stock without the consent of the legislature; discount, or receive any note or

other evidence of debt in payment of any instalment actually called in, or with the intent to provide the means of making such a payment; receive or discount any note or other evidence of debt with the intent of enabling any stockholder to withdraw any part of the money paid in by him on his stock; apply any of the corporate funds, except surplus profits, directly or indirectly, to the purchase of their own stock; receive any of their own shares in payment or satisfaction of any debt due to them; or exchange any of their own stock, or obligations, for the stock, or obligations, of any other corporation; to make any loans or discounts exceeding three times the amount of capital actually paid in; to make any loans or discounts to the directors, or upon paper bearing the directors' names, to more than one third of the capital. In the calculation of profits all interest due, but unpaid, was not to be reckoned; all expenses of management were to be deducted; also all interest due or paid on the debts of the company, and all losses sustained; all debts due, upon which no interest has been paid for one year, or debts upon which judgment has been recovered, but remained unsatisfied, for two years. All losses sustained which exceeded the undivided profits, should be subtracted from capital, and no dividend declared until the capital was replaced. All shares given as security for a debt which should not be paid, were to be sold within sixty days after the debt was due and unpaid, and if not sold, they were to be deducted from capital, and no dividend was to be declared until the loss should be made good. Every chartered bank was, on the 1st of January in each year, to send to the comptroller a very minute statement of its affairs, under the penalty of being proceeded against as insolvent, if it delayed doing so for one month. This statement is to show the amount of capital stock paid in or invested according to the charter; the value of the real estate of the company, and how much of it is occupied for the purpose of business; the amount held of its own stock, and whether absolutely or as collateral security; the debts due to it, specifying each kind; the debts due by it, also specifying each kind; the claims against it not acknowledged as debts; the amount for which it is bound as surety, or for which it may become liable by the happening of contingent events; of its notes and bills in circulation, its loans and discounts, and its specie in hand. Every such statement after the first shall also contain the amount of losses charged since the last, and the dividends declared. The comptroller is to tabulate all these particulars in a book, to be open to public inspection, and if he suspects that the figures are inaccurate, or that the corporation is insolvent, he is immediately to report to the legislature. No corporation having banking powers is to issue any note, or bill, for less than one dollar. And no banking company is by itself, or its agents, to buy up directly, or indirectly, any of its obligations for less than the sum then due on the face of them. No officer is to make any loan or advance on any security which he shall know to have been refused by any other officer of the bank. Every one of the company's obligations are to be payable at the banking house of the company. Many minute

regulations are made as to the election of directors, and the management of the safety fund.

462. With respect to unincorporated banks, or "banking associations" and private "bankers," it was enacted that the superintendent of the bank department should cause to be engraved a certain number of notes, like bank notes, of the same denominations as those authorized to be issued by the incorporated banks, and whenever any person, or association of persons, formed for the purpose of banking, should transfer to the superintendent, any portion of public stock, issued or to be issued by the State, such person, or association of persons, should be entitled to receive in return an equal amount of these notes. All such stock to be made equal to State stock at six per cent., and to be taken at its current market value, but not above its par value. But stock of the United States might be held instead of stock of the State. Such persons and associations having received these notes, and having signed them, so as to make them payable on demand at their houses of business, may loan and circulate them. No association may commence banking business until they have deposited with the superintendent securities required by law to the amount of 100,000 dollars, nor any private banker less than 50,000 dollars. Every individual banker, who receives such notes from the superintendent, must declare whether any other person is interested in the securities deposited, and he must also certify the town, city, or village, in which he resides himself. No banking association or private banker may issue or put in circulation any of their notes, except such as are payable on demand and without interest. If any person issuing such notes fail or refuse to pay them upon demand, during usual business hours, in the lawful money of the United States, the holder may cause them to be protested, and the superintendent, on receiving such protest, shall give notice in writing to the makers of the notes to pay them; and if they neglect to do so for fifteen days, the superintendent is to give notice in the State papers that all the notes issued by such persons shall be redeemed out of the securities held by him. All notes or bills, where payment is secured by the deposit of public stock, are to be stamped on their face "Secured by the pledge of public stocks." Instead of public stocks, such banking association, or private banker, may deposit one half the amount in bonds, or mortgages, upon real estate, bearing at least seven per cent. interest, of the State of New York, payable annually, or semi-annually, and in such case the bills and notes are to be stamped "Secured by pledge of public stocks, and real estate." All the securities lodged with the superintendent are to be held exclusively for the redemption of the bills and notes of such person or association put in circulation as money. Any number of persons may associate to establish offices of discount, deposit, and circulation, upon the terms and conditions of the Act, but the aggregate amount of the capital stock of such association must not be less than 100,000 dollars; and they are to certify under their hands and seals the name they intend to use in business; the place where their operations are to be carried on; the amount of their capital stock, and the number of shares into which it is

divided; the names and residences of the shareholders, and the number of shares held by each. Such associations may carry on the business of banking, by discounting bills, notes, and other evidences of debt; receive deposits; buy and sell gold and silver bullion, foreign coins, and bills of exchange; lend money on real security. The shares are to be deemed personal property, and may be transferred: such associations may provide by their articles for an increase of their capital, and the number of the associates, from time to time, as they may think proper. All suits and actions by and against such associations are to be in the name of the president, and all judgments and decrees obtained or rendered against such associations, are to be enforced only against the joint property of the association. No shareholder of any such association shall be liable in his private capacity for any of the debts, or engagements of the company, unless the articles of association signed by him shall declare him to be so. Such association is forbidden to purchase, hold, or convey, real estate, except such as shall be necessary for the transaction of its business, or such as shall be mortgaged to it *bonâ fide*, as security for a loan or a debt due to it, or such as it shall purchase at sales under judgments, decrees, or mortgages held by it. Upon application made by creditors, or shareholders, to the amount of 1,000 dollars, stating facts, verified by affidavit, the supreme court may, in its discretion, order a strict examination to be made in the affairs of the association to ascertain its condition, and the prudence of its management, and the result of such investigation is to be published in such manner as the court may direct.

463. Every banking association and private banker shall make out an annual statement, shewing the amount of certified stock paid in or invested, according to law; the value of the real estate held, specifying what portion of it is occupied for the transaction of business; the shares of stock held by such association, or individual banker, whether absolutely, or as collateral security, specifying each kind and description of stock, and the number and value of the shares of each. The debts due to them, specifying such as are due from moneyed or other corporations, and their names, and amounts, and the amount secured by bond and mortgage, or judgment; the amount which ought be included in the computation of losses, and the total amount then collectable; the amount of debts due by them, specifying such as are payable on demand, such as are due to moneyed, or other corporations, associations, or individual bankers, their names and the amounts due to each. The amount of claims against them not acknowledged as debts. The amount for which they are bound as sureties, or for which they may become liable on the happening of contingent events. The amount of the notes or bills then in circulation, of loans, and discounts, and of specie on hand; the same for the preceding July. The amount of losses charged, whether against capital or profits, since last preceding statement, and of the dividends declared and made during the same period; the amount of mortgages on real estate, and state stocks, together with the description of such stocks deposited as security for the circulating

notes issued, the market value of such stocks, as near as can be ascertained, and the date to which payment of interest has been made upon such mortgages and stocks, and whether the interest has been paid to the association or banker, or passed to their credit in the books of the superintendent. If any association neglected to make out and send this statement, it may be dissolved, and any private bankers be restrained from carrying on business. All banking companies and bankers, except those carrying on business in New York, Albany, Brooklyn, or Troy, must keep an agent in New York, Albany, or Troy, to pay all such of their notes as may be presented for payment, at a rate of discount not exceeding one quarter per cent. No banker is to receive, pay out, give, or offer in payment, as money, to circulate, or attempt to circulate as money, any bill, note, or other evidence of debt, issued, or purporting to be issued by any corporation, association, or individual, situated or residing without the State, and which shall purport to be payable or redeemable at any place, or by any person, association, or corporation within the State. All bankers and banking institutions are forbidden to borrow from each other any notes, bills, &c., for the purpose of putting them into circulation, nor are they to issue any of their notes, &c., at a discount. By a subsequent act, in 1850, it is enacted that if any banking institution which issues any kind of paper credit to circulate as money, shall make default in paying any engagement, the stockholders are to be liable in their private capacities in proportion to their shares.

464. It had been resolved by the New York banks to resume specie payments on the 10th of May, and the convention of bank delegates had endeavoured to induce the Philadelphia banks to agree to do so at the same time. But they, or rather Mr. Biddle, who was the autocrat of the banking interest at Philadelphia, refused, and threw every impediment in the way that he could. This person and his bank were now deep in cotton speculations, which a resumption of cash payments would have disturbed, he, therefore, so far from taking the lead in resuming cash payments, as he had boasted he would, manifested the most vehement hostility to those who did. But the New York banks, notwithstanding, adhered to their resolve, and many of them, as well as those of Boston, commenced paying cash on the 1st of May. The New York and Boston banks, however, were the only ones that did so. Mr. Biddle was repeatedly called upon to resume payment, as he boasted of his perfect ability to do so, but always put it off, on one pretext or another. His party had always maintained that the specie circular of the President, in July, 1836, had been the chief cause of the embarrassments. In July, 1838, this was repealed by an Act of Congress which forbade any difference to be made in receiving payments of the public revenue. Mr. Biddle's swagger now rose higher than ever: he declared that he now saw no difficulty in resuming cash payments, and that he was ready to co-operate with the executive in restoring a sound currency. Nevertheless he made no movement towards it, and always tried to defeat any effort for that purpose. A meeting of the Philadelphia banks took place, and resolved, by a majority, to resume on the

1st of August, but Mr. Biddle's agent voted in the minority, and did everything he could to upset the decision of the majority. A general cry was then raised, that Mr. Biddle's bank was in a state of insolvency, and wholly unable to resume payments. However all delays were cut short by the Governor of Pennsylvania issuing a proclamation, that all banks in the State must resume payment on the 13th of August, under the penalty of forfeiting their charters. But Mr. Biddle's wild speculations in cotton now began to bear their legitimate fruit. From the quantities of cotton known to be held by him, and the prices paid for them, *The Times* of September 29, 1838, calculated that his losses then amounted to £500,000.

465. In his message to Congress in 1838, President Van Buren adopted and continued the policy of his predecessor with regard to a National Bank. "The contrast between the suspension of 1814 and that of 1837, is most striking. The short duration of the latter, the prompt restoration of business, the evident benefits resulting from an adherence by the government to the constitutional standard of value, instead of sanctioning the suspension by the receipt of irredeemable paper, and the advantages derived from the large amount of specie introduced into the country previous to 1837, afford a valuable illustration of the true policy of the government in such a crisis. Nor can the comparison fail to remove the impression that a national bank is necessary in such emergencies. Not only were specie payments resumed without its aid, but exchanges have also been more rapidly restored than when it existed; thereby shewing that private capital, enterprise, and prudence, are fully adequate to those ends. On all these points experience seems to have confirmed the views heretofore submitted to Congress. We have been saved the mortification of seeing the distresses of the community for the third time seized on to fasten upon the country so dangerous an institution; and we may also hope that the business of individuals will hereafter be relieved from the injurious effects of a continued agitation of that disturbing subject. The limited influence of a national bank in averting derangement in the exchanges of the country, or in compelling the resumption of specie payments, is now not less apparent than its tendency to increase inordinate speculations by sudden expansions and contractions; its disposition to create panic and embarrassment for the promotion of its own designs; its interference with politics, and its far greater power for evil than for good, either in regard to the local institution, or to the operations of Government itself. What was in these respects but apprehension, or opinion, when a national bank was first established, now stands confirmed by humiliating experience. The scenes through which we have passed conclusively prove how little our commerce, agriculture, manufactures or finances, require such an institution, and what dangers are attendant on its power—a power, I trust, never to be conferred by the American people upon their government, and still less upon individuals not responsible to them for its unavoidable abuses."

466. Towards the end of 1838, the Bank of Belgium had failed, and the whole of that country

was thrown into confusion by the mismanagement of several monetary companies, who had been speculating in all sorts of things they ought not to have done. These failures deranged the commerce of France, in which a very large number of the shares of these Belgian companies were held. In the beginning of 1839, the Scotch banks, who were the most sagacious in perceiving danger from afar, sold out large quantities of government securities. These circumstances caused a heavy demand for bullion from the Bank of England, which (as usual) was fast asleep, while everyone else saw that danger was approaching. At last, in April, the bank directors could no longer conceal from themselves their impending danger, and made no secret of their uneasiness at their position. They began to make violent efforts to contract their issues to stop the outflow of bullion. At the same time news of a similar character arrived from America. Several failures had taken place among the banks, and a number more were expected in various parts of the Union. They were especially severe in Michigan, where all the joint stock and private bankers failed. A bill was brought into the assembly to make land a legal tender at two-thirds of its appraised value, in the absence of specie and bank paper currency. Immense failures also took place in the other Western States. A demand began upon the banks generally for specie, which were thus obliged to contract their business, and this produced a panic about the end of March. The stock of the banks fell rapidly. The State Bank of Illinois failed, and the domestic exchanges became rapidly disordered. The stock of Mr. Biddle's bank fell rapidly, and his wild operations had raised up against him a strong opposition in Pennsylvania, who wished to annul his charter. In April the banks in Mississippi and Georgia began to fail, most of the Western banks having followed the example of the Bank of the United States, and become traders as well as bankers. Some bank notes were already at 25 discount. The abominable system which the Mississippi banks followed, of buying up vast quantities of cotton on speculation, now began to be felt severely. The quantities accumulated were so great, that it was clear to every one, that their sale would be attended with a frightful loss. In the midst of this panic, Mr. Biddle suddenly resigned the Presidency of the United States Bank, to everybody's astonishment, on the pretence of ill health, but at the same time publishing to the world that it was in a safe and prosperous condition, which nobody believed; but set it down to the inevitable crisis which was rapidly approaching in American banking.

467. Not only were the actual operations of the American banks at this period of the most dangerous description, but there was published at this time a remarkable little monthly periodical, called *The Counterfeit Detector and Bank Note List*, 12½ pages of which, out of 16, were occupied with accounts of the different sorts of counterfeit dollar paper afloat, with lists of the broken and suspended and fraudulent banks. In the list of "counterfeit and altered notes" nearly forty different sorts are enumerated as in circulation, as forgeries of the Notes of the Bank of the United States at Philadelphia, and 140 different sorts are described as being afloat as forgeries of

its different branch notes in various parts of the Union. The total number of kinds of forged notes of other banks known to be in circulation was about 600, so that an immense proportion of the paper currency actually afloat was known to be forged. Moreover, there were a number of fraudulent banks, which in fact had no existence at all, except on the paper in circulation. They were generally made in imitation of the name of some well known institution. Of these imaginary banks, there were fifty whose paper was in circulation. This was technically called "wild cat money."

468. As the summer went on, difficulties thickened round the Bank of the United States, which was under immense obligations on account of her post notes and bonds, which had been poured out in such torrents on the English market. The Bank of England, being in the direct extremity itself, in August, 1839, raised the rate of discount to 6 per cent., which at last ruined the market for these American speculators. The Bank of the United States opened a negotiation in Holland, to raise funds to meet their obligations in England. At length the blow fell. On the 16th September, 1839, the Paris correspondents of the Bank of the United States refused acceptance of its drafts. The sagacity of the *Times*, which had for a long period denounced the bank and its wild mismanagement, and which, indeed, was the first to raise the cry of danger, was fully vindicated. On the 26th, the London agent of the bank made application to the Bank of England for assistance, as their negotiations in Holland had been interrupted by the news of the dishonour of their bills by their Paris correspondents. Assistance to a small amount was granted, on the guarantee of several of the first names in the city, pending the arrival of the next steamer from America, upon which the fate of the bank hung. In the meantime, the struggles of the bank to maintain its credit, were causing the deepest distress throughout the Union. The *New York Evening Post* said, "It is hardly possible to describe the exasperation against the United States Bank of Pennsylvania, which now prevails among the mercantile part of our population. Everybody understands and declares that the operations, of which that bank is the source and centre, are the cause of the present paroxysm of pressure. Everybody sees that it regulates currency and credit, to be sure, but it regulates them with a view to its own profits in the cotton trade, from which it has elbowed every individual merchant. It regulates the currency by throwing out a debased issue of post notes; it regulates credit by bestowing it in large proportions upon its favourite customers, and by compelling the smaller banks, by a run upon their vaults, to contract their discounts, and withhold their usual accommodations. If a storm of execrations could blow down the bank, not a stone of its walls would be left upon another." In order to provide means to meet its engagements, the bank was then selling its post notes at a discount of 1½ per cent. per month, in New York. The price of the stock fell rapidly. It was fully expected that the Bank of England itself would suspend cash payments, and have to issue £1 and £2 notes.

469. The last struggles of this wretched bank were now at hand, after straining all its resources,

and exhausting all its powers to raise money at 24 per cent. interest, and before its European difficulties were known in America, it could only send £120,000 by the steamer of September to London. The *New York Evening Post* said, "LE COMMENCEMENT DE LA FIN. The movements of the Bank of the United States appear certainly exceedingly suspicious, and seem to caution all prudent men too portentously to be disregarded, to 'beware of the flurry.' What is the meaning of the desperate game of post notes, pushed abroad in all quarters, to raise money upon at the ruinous rate of 20 per cent. discount (equal to 25 per cent. interest)? One of the most intelligent and reliable authorities in Wall Street estimates their amount in New York alone, from data within his own knowledge, at upwards of 10,000,000! Another, not less so, remarks that he has reason to know it to be not less than 20,000,000. The excuse put forth that this loss is sustained by other institutions and individuals, they being willing to take them as cash from the bank, and not by the bank itself, is miserably futile; for the question immediately occurs, what sort of parties must these be, in responsibility and strength, who can be willing to pay the bank 6 per cent. for their loans, and then turn round and convert the funds thus received into cash at a further discount of 20 per cent.? Is Mr. Benton right after all, who has for years back entertained a profound conviction that the bank was at bottom insolvent, and that it was merely staggering on from expedient to expedient, to shift its responsibilities and postpone the evil day of payment? Is this the meaning of Mr. Biddle's sudden resignation and departure for Europe, and of the substitution of a man of straw in the throne so long and so ably filled by him? Is this the meaning of the so long withheld monthly publication of its condition, required by its charter? Is this the meaning of the late rapid and unparalleled depreciation of its stock?" The bank was also receiving money at Boston on similar terms. "The Bostonians lately had a requital for their adhesion to the United States Bank in its non-resumption policy. Their money matters had been quiet and they were going on easily, when the Bank of the United States put its sucker into their pond in the shape of 800,000 dollars of post notes. * * * The long continued fictitious operations of the United States Bank to raise money, have at last awakened an anxious inquiry on all hands for the cause. A bank with 35,000,000 of capital giving its note at six months for a single hundred dollars, to be sold in the street at the rate of 18 per cent per annum, discount—realizing vast sums by drawing bills on Europe without funds there at the time of drawing, and yet having no money to loan here, while those bills are running to maturity—so completely without means that it cannot help a customer to 5000 dollars, except by giving him a post note running to maturity at a period much more distant than the maturity of the securities it receives. Did ever a well managed bank behave so?" Another paper, the *Newhaven Columbian Register*, said, "There are thousands of the business men of our country, who are now satisfied, though they formerly thought otherwise, that the United States Bank of Pennsylvania, instead of being the 'regulator,' is the 'great disturber' of the

currency, and of all regular dealings. They were unwilling to believe that an institution whose first duty it was to lend its capital to the prudent dealer at 6 per cent., should have become so entangled in its own speculations, as to be compelled to borrow money at 18 and 21 per cent. But they cannot shut their eyes to the facts that are daily passing before them, and which the sales of post notes, as constantly reported in the New York, Boston, and Philadelphia papers, verify. If the evils of the post note system were confined to the United States Bank, they might be borne with; but the greatest difficulty is, that many of the other banks, all over the country, instead of aiding business people, as they should with their loans, employ their funds in shaving the post note paper of the United States Bank. The mechanic, manufacturer, or merchant, who goes to their counter with a well endorsed note of a few hundred dollars, is told that he cannot be accommodated. The civil cashier does not now as formerly, tell the applicant that the deposits have been removed, or the specie circular issued, and that money can never be plenty until the administration of the general government be overthrown, because such excuses would not at the present day be available with men of any party. The public have closely watched the dividends of these banks, and have discovered that while the people are cramped in their loans, and are told that money never was so scarce, when in short the banks are "doing nothing" over their counters, many of them are making larger dividends than ever they did before. How is this, when according to the rules of old-fashioned banking, the dividends, or profits, should depend on the prosperity of business, and the 6 per cent. loans of those most active in business pursuits? But the career of the United States Bank solves the mystery. It has set an example which has reversed the old system of lending money at 6 per cent. That institution, instead of lending to those who do business, has undertaken to trade and speculate on its own hook. And when it wishes to borrow money to carry its trading operations through, it offers to pay usurious interest, so far beyond the regular 6 per cent. borrower, that other banks are tempted to withdraw their funds from the business community, and make loans at usurious rates to the monopolizer; or, in other words, they buy its post notes at the rate of 18 and 21 per cent. a year, and leave their old 6 per cent. customers to take care of themselves as they can. All our principal cities have thus been interfered with by the "great disturber." The city of Boston has been, till quite lately, exempt, and was getting along in comparative prosperity, but a few days ago, the "great disturber" put its sucker in the midst of them, and all was at once thrown into confusion. It was done in this way. an agent of the United States Bank appeared in Boston with 800,000 dollars of post notes at six, nine, and twelve months to run, which were in the market at the tempting offers of 18 per cent. or more discount. These offers were snapped at by the capitalists and banks, who advanced the cash to the agent; he quickly drew the specie from them, and carried it to the United States banking house at Philadelphia, where it was, no doubt, wanted to meet the pressing engagements of that institution. When the business people of

Boston the next day applied as usual for bank accommodation, they were told there was a dreadful pressure on the money market just then, and they could on no terms be accommodated." Another paper says: "It is only repeating what has become the common declaration on change, and in the counting-houses, to say, that the almost universal opinion of the mercantile community demands some check upon the caprices of the United States Bank. Its despotism has become intolerable." In the midst of this financial distress, the United States Bank contracted to lend the State of Pennsylvania 2,000,000 dollars, on condition of being allowed to issue 5-dollar notes. This expedient, however, was tried and found useless; they were returned on the bank as soon as issued.

470. The final catastrophe came on the 10th October. On that day the United States Bank stopped payment, and this was immediately followed by nearly all the banks in the Southern States, except New Orleans. The notes of the Philadelphia banks at once fell 10 per cent. at New York. The banks in New England vigorously stood their ground, notwithstanding strenuous efforts were made to induce them to stop payment. Thus, after a career of three years and a half, this Bank, which professed to have a capital of 35,000,000 dollars, or £7,000,000, failed twice, after raising an amount of money equal to half its capital, at rates from 6 to 24 per cent.

471. A large portion of the President's message in December was, of course, occupied with the monetary crisis. He dwelt with great length and emphasis on the extravagant abuses of the credit system in America. He congratulated Congress on the success of the government in withdrawing its deposits from the different banks, and keeping them itself, and earnestly pointed out the advantages of a metallic currency, and animadverted upon the low morality of the banks, which now seemed to think that they might adopt a suspension of cash payments whenever it suited their interests. "It now appears that there are other motives than a want of public confidence, under which the banks seek to justify themselves in a refusal to meet their obligations. Scarcely were the government and the country relieved, in a degree from the difficulties occasioned by the general suspension of 1837, when a partial one accruing within 30 months of the former, produced new and serious embarrassments, though it had no palliation in such circumstances as were alleged in justification of that which had previously taken place. There was nothing in the condition of the country to endanger a well-managed banking institution; commerce was deranged by no foreign war; every branch of manufacturing industry was crowned with rich rewards; and the more than usual abundance of our harvests, after supplying our domestic wants, had left our granaries and storehouses filled with a surplus for exportation. It is in the midst of this, that an irredeemable and depreciated paper currency is entailed upon the people, by a large portion of the banks. They are not driven to it by an exhibition of a loss of public confidence, or from a sudden pressure of their depositors, or noteholders; but they excuse themselves by alleging that the current of business, and exchange with foreign

countries, which draw the precious metals from their vaults, would require, in order to meet it, a larger curtailment of their loans to a comparatively small portion of the community, than it will be convenient for them to bear, or the banks to exact. The plea has ceased to be one of necessity. Convenience and policy are now deemed sufficient to warrant these institutions in disregarding their solemn obligations. Such conduct is not merely an injury to individual creditors, but it is a wrong to the whole community, from whose liberality they hold most valuable privileges—whose rights they violate—whose business they derange, and the value of whose property they render unstable and insecure. It must be evident that this new ground for bank suspensions, in reference to which their action is not only disconnected with, but wholly independent of that of the public, gives a character to their suspension, more alarming than any which they exhibited before, and greatly increases the impropriety of relying on the banks in the transactions of the government. * * * * *

New dangers to the banks are also daily disclosed from the extension of that system of extravagant credit, of which they are the pillars. Formerly our foreign commerce was principally founded on an exchange of commodities, including the precious metals, and leaving in its transactions but little foreign debt. Such is not now the case. Aided by the facilities afforded by the banks, mere credit has become too commonly the basis of trade. Many of the banks themselves not content with largely stimulating this system among others, have usurped the business while they impair the stability of the mercantile community; they have become borrowers instead of lenders; they establish their agencies abroad; they deal largely in stocks and merchandize; they encourage the issues of state securities, until the foreign market is glutted with them, and unsatisfied with the legitimate use of their own capital, and the exercise of their lawful privileges, they raise by large loans additional means for every variety of speculation. The disasters attending on this deviation from the former course of business in this country are now shared alike by banks and individuals, to an extent of which there is perhaps no previous example in the annals of our country. So long as the willingness of the foreign lender, and a sufficient export of our productions to meet any necessary partial payments, leave the flow of credit undisturbed, all appears to be prosperous, but as soon as it is checked by any hesitation abroad, or by an inability to make payment there in our production, the evils of the system are disclosed. The paper currency which might serve for domestic purposes, is useless to pay the debt due in Europe. Gold and silver are therefore drawn in exchange for their notes from the banks. To keep up their supply of coin, these institutions are obliged to call upon their own debtors, who pay them principally in their own notes, which are as unavailable to them, as they are to the merchant to meet the foreign demand. The calls of the banks, therefore, to meet such emergencies, of necessity exceed that demand, and produce a corresponding curtailment of their accommodation, and of the currency, at the very moment when the state of trade renders it most inconvenient to be borne.

The intensity of this pressure on the community, is in proportion to the previous liberality of credit, and consequent expansion of the currency; forced sales of property are made at the time when the means of purchasing are most reduced, and the worst calamities to individuals are only at last arrested by an open violation of their obligations by the banks, a refusal to pay specie for their notes, and an imposition upon the community of a fluctuating and depreciated currency. These consequences are inherent in the present system. They are not influenced by the banks being large or small, created by national, or state governments. They are the results of the irresistible laws of trade and credit. In the recent events which have so strikingly illustrated the certain effects of these laws, we have seen the bank of the largest capital of the Union, established under a national charter, and lately strengthened, as we were authoritatively informed, by exchanging that for a state charter, with new and unusual privileges—in condition too, as it said, of entire soundness and great prosperity—not merely unable to resist these effects, but the first to yield to them."

472. The President then showed that these were valid reasons for not entrusting the moneys of the State to these banks, or taking their notes in payment of dues, and such a rule could have no real harshness. "It is, moreover, a principle, than which none is better settled by experience, that the supply of the precious metals will always be found adequate to the uses for which they are required. They abound in countries where no other currency is allowed. In our own States, where small notes are excluded, gold and silver supply their place. When driven to their hiding places by bank suspensions, a little firmness in the community soon restores them in a sufficient quantity for ordinary purposes. Postage and other public dues have been collected in coin, without serious inconvenience, even in a State where a depreciated paper currency has existed for years, and this with the aid of treasury notes for a part of the time, was done without interruption during the suspension of 1837. At the present moment the receipts and disbursements of the government are made in legal currency, in the largest portion of the Union. No one suggests a departure from this rule, and if it can now be successfully carried out, it will surely be attended with even less difficulty when bank notes are again redeemed in specie."

473. The President pointed out that the enforcement of cash payments in all transactions of the government would have a strong effect in moderating the excessive credit operations of ill-managed banks, and strengthening well managed ones. He adverted to the scheme for founding a new national bank, to control the issues of the provincial ones. "I am aware that it has been urged that this control may be best attained, and exerted by means of a national bank. The constitutional objections which I am well known to entertain, would prevent me in any event from proposing or assenting to that remedy; but in addition to this, I cannot, after past experience, bring myself to think that it can any longer be extensively regarded for such a purpose. The history of the late national bank, through all its mutations, shews that it was not so. On the con-

trary, it may, after a careful consideration of the subject, be, I think, safely stated, that at every period of banking excess it took the lead; that in 1817, and 1818, in 1823, in 1831, and 1834, its vast expansions followed by distressing contractions, led to those of the state institutions. It swelled and maddened the tides of the banking system, but seldom allayed, or safely directed them. At a few periods only was a salutary control exercised, but an eager desire on the contrary exhibited for profit in the first place, and if afterwards its measures were severe towards other institutions, it was because its own safety compelled it to adopt them. It did not differ from them in principle or form; its measures emanated from the same spirit of gain; it felt the same temptation to over issues; it suffered from, and was totally unable to avert, these laws of trade, by which it was itself affected equally with them; and at least on one occasion, at an early day, it was saved only by extraordinary exertions from the same fate that attended the weakest institution it professed to supervise. In 1837, it failed, equally with others, in redeeming its notes, though the two years allowed by its charter for that purpose had not expired, a large amount of which remain to the present time outstanding. It is time that, having so vast a capital, and strengthened by the use of all the revenues of the government, it possessed more power, but while it was itself, by this circumstance, freed from the control which all banks require, its paramount object and inducement were left the same—to make the most for its stockholders; not to regulate the currency of the country. Nor has it, as far as we are advised, been found to be greatly otherwise elsewhere. The national character given to the Bank of England has not prevented excessive fluctuation of their currency; and it proved unable to keep off a suspension of specie payments, which lasted for nearly a quarter of a century. And why should we expect it to be otherwise? A national institution, though deriving its charter from a different source than the State banks, is yet constituted upon the same principles; is conducted by men equally exposed to temptation; and is liable to the same disasters; with the additional disadvantage that its magnitude occasions an extent of confusion and distress, which the mismanagement of smaller institutions could not produce. It can scarcely be doubted that the recent suspension of the United States Bank of Pennsylvania—of which the effects are felt not in that State alone, but over half the Union—had its origin in a course of business commenced while it was a national institution, and there is no good reason for supposing that the same consequences would not have followed, had it still derived its powers from the general government. It is in vain, when the influences and impulses are the same, to look for a difference in conduct or results. By such creations we do, therefore, but increase the mass of paper credit and paper currency, without checking their attendant evils and fluctuations. The extent of power and the efficacy of organization which we give, so far from being beneficial, are in practice positively injurious. They strengthen the claim of dependence throughout the Union, subject all parts more certainly to common disaster, and bind every

bank more effectually, in the first instance, to those of our commercial cities, and in the end to a foreign power. In a word, I cannot but believe that, with the full understanding of the operations of our banking system, which experience has produced, public sentiment is not less opposed to the creation of a national bank for purposes connected with currency and commerce, than for those connected with the fiscal operations of the government.

"Yet the commerce and currency of the country are suffering evils from the operations of the State banks, which cannot and ought not to be overlooked. By their means we have been flooded with a depreciated paper, which it was evidently the design of the framers of the constitution to prevent, when they required Congress to 'coin money, and regulate the value of foreign coins,' and when they forbade the States to 'coin money, emit bills of credit, make anything but gold and silver a tender in payment of debts,' or 'pass any law impairing the obligation of contracts.' If they did not guard more explicitly against the present state of things, it was because they could not have anticipated that the few banks then existing were to swell to an extent, which would expel to so great a degree the gold and silver for which they had provided, from the channels of circulation, and fill them with a currency that defeats the object they had in view. The remedy for this must chiefly rest with the States from whose legislation it has sprung. No good that might accrue in a particular case, from the exercise of powers not obviously conferred on the general government, would authorize its interference, or justify a course that might, in the slightest degree, increase, at the expense of the State, the power of the federal authorities; nor do I doubt that the States will apply the remedy. Within the last few years, events have appealed to them too strongly to be disregarded. They have seen that the constitution, though theoretically adhered to, is subverted in practice; that while in the Statute books there is no legal tender but gold and silver, no law impairing the obligation of contracts, yet that, in point of fact, the privileges conferred on banking corporations have made their notes the currency of the country, that the obligations imposed by these notes are violated under the impulses of interest or convenience; and that the number and power of the persons connected with these corporations, or placed under their influence, give them a fearful weight when their interest is in opposition to the spirit of the constitution and laws. To the people it is immaterial whether these results are produced by open violations of the latter, or by the workings of a system of which the result is the same. An inflexible execution even of the existing statutes of most of the states would redress many evils now endured; would effectually show the banks the dangers of mismanagement, which impunity encourages them to repeat; and would teach all corporations the useful lesson that they are the subjects of the law, and the servants of the people. What is still wanting to effect these objects must be sought in additional legislation; or if that be inadequate, in such further constitutional grants or restrictions, as may bring us back into the path from which we have so widely wandered.

"But let it be indelibly engraven on our minds that relief is not to be found in expedients. Indebtedness cannot be lessened by borrowing more money, or by changing the form of the debt. The balance of trade is not to be turned in our favour by creating new demands upon us abroad. Our currency cannot be improved by the creation of new banks, or more issues from those that now exist. Although these devices sometimes appear to give temporary relief, they almost invariably aggravate the evil in the end. It is only by retrenchment and reform, by curtailing public and private expenditure, by paying our debts, and by reforming our banking system, that we are to expect effectual relief, security for the future, and an enduring prosperity."

474. This second suspension of cash payments lasted in the State of Pennsylvania till the 15th of January, 1841, to which it was limited by an Act of that State. The Bank of the United States then attempted to resume payment, but such was the feeling of hostility and distrust towards it, that an immediate run began upon it, and it finally stopped payment on the 4th of February, 1841. Such was the end of this bank, which for many years was one of the great party questions of the Union. The stockholders, in January, 1841, appointed a committee of investigation into its affairs, who made a report in April. This report, though very brief and general, at least for so great an affair, disclosed a course of management as reckless and improvident as any instance of any joint stock bank, that we are aware of. It estimated the loss of capital, as then ascertained, at 17,301,946 dollars, but such estimates of the value of the assets of suspended banks, are very rarely realized, and we believe that on the final liquidation of its affairs, the whole capital was found to be gone. The other banks in Philadelphia followed the example of the United States Bank, and did not resume until the 18th of March, 1842, making their fourth suspension. On the occasion of the suspension in 1839, out of 850 banks in the Union, 343 stopped payment entirely, and 62 partially. But the New England Banks were honourably distinguished, for out of 198 in New York, only four suspended, while in the Southern and Western States, two out of every three stopped.

475. In 1840, the President again alluded to the question of a national debt, and a national bank, in his message. When the final determination to refuse the renewal of the Charter of the Bank of the United States was adopted, it became necessary to provide for the safe keeping of the public monies, which had hitherto been deposited in that bank. An Act was accordingly passed, by which they were distributed among 50 or 60 of the State Banks, which enjoyed the highest reputation. This was done in 1836, but in 1837, the universal suspension took place, which placed the government in extreme embarrassment, for all its monies were locked up in these suspended State banks, and it had nothing to pay to its creditors but their depreciated paper. The government is said to have lost about 1,900,000 dollars by these bankrupt banks. Thenceforward, it determined to keep all the public monies in the Treasury itself. The President congratulated Congress in 1840, upon the entire success

of this plan, notwithstanding the apparently insurmountable difficulties in which the government had been placed by the suspension of the banks, all of these had been overcome, and every claim upon them, at home or abroad, had been promptly met. "Among the reflections arising from the contemplation of these circumstances, one not the least gratifying, is the consciousness that the government had the resolution and the ability to adhere, in every emergency, to the sacred obligations of law; to execute all its contracts, according to the requirements of the constitution; and thus to present, when most needed, a rallying point, by which the business of the whole country might be brought back to a safe and unvarying standard,—a result vitally important, as well to the interests, as to the morals, of the people. There can surely now be no difference of opinion in regard to the incalculable evils that would have arisen, if the government at that critical moment had suffered itself to be deterred from upholding the only true standard of value, either by the pressure of adverse circumstances, or the violence of unmerited denunciation." The President then emphatically warned the nation against the habit of contracting public debts, among the objections to which, he said, was the certain tendency of public securities to concentrate ultimately in the hands of foreign holders. Already, he said, the resources of many of the States, and the future industry of their citizens, have been indefinitely mortgaged to foreigners, to the amount of twelve millions annually, which gave foreigners a right to meddle with the internal affairs of the Union, in a manner calculated to excite serious alarm. The President then expatiated on the evils of the public debts, and said that he had come into office the declared enemy of both a national debt and a national bank. "If a national bank was, as is undeniable, repudiated by the framers of the constitution, as incompatible with the rights of the States, and the liberties of the people; if from the beginning, it has been regarded by a large portion of our citizens as coming in direct collision with that great and vital amendment of the constitution, which declares that all powers not conferred by that instrument on the general government, are reserved to the States and to the people; if it has been viewed by them as the first great step in the march of latitudinous construction, which, unchecked, would render that sacred instrument of as little value as an unwritten constitution, dependent, as it would alone be, for its meaning, on the interested interpretation of a dominant party, and affording no security to the rights of the minority; if such is undeniably the case, what rational grounds could have been conceived for anticipating aught but determined opposition to such an institution at the present day?

"Could a different result have been expected, when the consequences which have flowed from its creation, and particularly from its struggles to perpetuate its existence, had confirmed in so striking a manner the apprehensions of its earliest opponents; when it had been so clearly demonstrated that a concentrated money power, wielding so vast a capital, and combining such incalculable means or influence, may in those peculiar conjunctures, to which this government

is unavoidably exposed, prove an overmatch for the political power of the people themselves; when the true character of its capacity to regulate, according to its will and its interests, and the interests of its favorites, the value and production of the labor and property of every man in this extended country, had been so fully and fearfully developed; when it was notorious that all classes of this great community had, by means of the power and influence it thus possesses, been infected to madness with a spirit of heedless speculation; when it had been seen that, secure in the support of the combination of influences by which it was surrounded, it could violate its charter, and set the laws at defiance with impunity; and when, too, it had become most apparent, that, to believe that such an accumulation of powers can never be granted without the certainty of being abused, was to indulge in a fatal delusion? * * *

"In lieu of a national bank, or a dependence upon banks of any description, for the management of our fiscal affairs, I recommend the adoption of the system which is now in successful operation. That system affords every requisite facility for the transaction of the pecuniary concerns of the government; will, it is confidently anticipated, produce in other respects, many of the benefits which have, from time to time, been expected from the creation of a national bank, but which have never been realized; avoid the manifold evils of such an institution, * * * do away, for ever, all dependence on corporate bodies, either in raising, collecting, safekeeping, or disbursing the public revenues; and place the government equally above the temptation of fostering a dangerous and unconstitutional institution at home, or the necessity of adapting its policy to the views and interests of a still more formidable money power abroad.

"It is, by adopting and carrying out these principles, under circumstances, the most arduous and discouraging, that the attempt has been made, thus far successfully, to demonstrate to the people of the United States that a national bank at all times, and a national debt, except it be incurred at a period when the honor and safety of the nation demand the temporary sacrifice of a policy, which should only be abandoned in such exigencies, are not merely unnecessary, but in direct and deadly hostility to the principles of their government, and to their own permanent welfare.

"The progress made in the development of these positions, appears in the preceding sketch of the past history and present state of the financial concerns of the federal government. The facts there stated fully authorize the assertion that all the purposes, for which government was instituted, have been accomplished during four years of greater pecuniary embarrassment, than were ever before experienced in time of peace, and in the face of opposition, as formidable as any that was ever before arrayed against the policy of an administration; that this has been done when the ordinary revenues of the government were generally decreasing, as well from the operation of the laws, as the condition of the country; without the creation of a permanent public debt, or incurring any liability, other than such as the ordinary resources of the government will speedily discharge, and without the agency of a national bank. * * *

"The first, and assuredly, not the least, important step towards relieving the country from the condition into which it has been plunged by excesses in trade, banking, and credits of all kinds, was to place the business transactions of the government itself on a solid basis; giving and receiving in all cases value for value, and neither countenancing, nor encouraging in others, that delusive system of credit, from which it has been found so difficult to escape, and which has left nothing behind it, but the wrecks that mark its fatal career.

"That the financial affairs of the government are now, and have been during the whole period of the wide spreading difficulties, conducted with a strict and invariable regard to this great fundamental principle, and that by the assumption and maintenance of the stand thus taken on the very threshold of the approaching crisis, more than by any other cause or causes whatever, the community at large has been shielded from the incalculable evils of a general indefinite suspension of specie payments, and a consequent annihilation for the whole period it might have lasted, of a just and invariable standard of value, will, it is believed at this period, scarcely be questioned.

"A steady adherence on the part of the government to the policy which has produced such salutary results, aided by judicious state legislation, and what is not less important, by the industry, enterprise, perseverance, and economy of the American people, cannot fail to raise the whole country, at an early period, to a state of solid and enduring prosperity, not subject to be again overthrown by the suspension of banks, or the explosion of a bloated credit system."

476. The next President, General Harrison, was not so keen an advocate for a metallic currency as his predecessors. He said, in 1841, "connected with this subject is the character of the currency. The idea of making it exclusively metallic, however well intended, appears to me to be fraught with more fatal consequences than any other scheme, having no relation to the personal rights of the citizen, that has ever been devised. If any single scheme could produce the effect of arresting at once that mutation of condition, by which thousands of our most indigent fellow citizens, by their industry and enterprise, are raised to the possession of wealth, that is the one. If there is one measure better calculated than another to produce that state of things so much deprecated by all true republicans, by which the rich are daily adding to their hoards, and the poor sinking deeper into penury, it is an exclusive metallic currency. Or if there is a process by which the character of the country for generosity, and nobleness of feeling, may be destroyed by this great increase and necessary toleration of usury, it is an exclusive metallic currency." In this rhetorical attack on an exclusively metallic currency General Harrison was fighting against a shadow, no one proposed an exclusively metallic currency, but only what common honesty demanded, that the notes of banks should be really and *bona fide*, what they professed to be, convertible into specie at the will of the holder, and that there should be a sufficient metallic basis to the currency to prevent those tremendous fluctuations in it, which spread so much ruin and desolation. General Harrison, however, died

before he could unfold any policy, and was succeeded by Mr. Tyler, who thus delivered his sentiments on the subject. "If paper be used as the chief medium of circulation, and the power be vested in the government of issuing it at pleasure, either in the form of treasury drafts or any other; or if banks be used as the public depositories, with liberty to regard all surplusses from day to day, as so much added to their active capital, prices are exposed to constant fluctuations, and industry to severe suffering. In the one case, political considerations directed to party purposes may control, while excessive cupidity may prevail on the other. The public is thus constantly liable to imposition. Expansions and contractions may follow each other in rapid succession—the one engendering a reckless spirit of adventure and speculation, which embraces states as well as individuals—the other causing a fall in prices, and accomplishing an entire change in the aspect of affairs. Stocks of all sorts rapidly decline, individuals are ruined, and states embarrassed—even in their efforts to meet with punctuality the interest on their debts. Such unhappily is the condition of things now existing in the United States. These effects may be readily traced to the causes above referred to. The public revenues being removed from the then bank of the United States, under an order of a late President, were placed in selected State banks, which actuated by the double motive of conciliating the government, and augmenting their profits to the greatest possible extent, enlarged extravagantly their discounts, thus enabling all existing banks to do the same; large dividends were declared, which stimulating the cupidity of capitalists, caused such a rush to be made to the legislatures of the respective states for similar acts of incorporation, which, by many of the states, under a temporary infatuation, were readily granted; and thus the augmentation of the circulating medium, consisting almost exclusively of paper, produced a most fatal delusion. An illustration derived from the land sales of the period alluded to, will serve best to shew the effect of the whole system. The average sales of the public lands for a period of ten years prior to 1834, had not much exceeded two millions of dollars per annum. In 1834, they attained in round numbers to the amount of six millions of dollars; in the succeeding year of 1835, they reached sixteen millions of dollars; and the next year of 1836, they amounted to the enormous sum of twenty-five millions of dollars—thus crowding into the short space of three years, upwards of seventy-three years' purchase of the public domain. So apparent had become the necessity of arresting this course of things, that the executive department assumed the highly questionable power of discriminating in the funds to be used in payment by different classes of public debtors; a discrimination which was doubtless designed to correct this most ruinous state of things, by the exaction of specie in all payments of the public lands, but which could not at once arrest the tide which had so strongly set in. Hence the demand for specie becoming unceasing, and corresponding prostration rapidly ensued under the necessities created with the banks to curtail their discounts, and thereby to reduce their circulation. I recur to these things with no disposition to censure pre-existing admin-

istrations of the government, but simply in exemplification of the truth of the position which I have assumed. If then any fiscal agent which may be created, shall be placed without due restrictions, either in the hands of the administrators of the government, or those of private individuals, the temptation to abuse will prove to be resistless. Objects of political aggrandizement may seduce the first, and the promptings of a boundless cupidity will assail the last. * * The charter of the bank of the United States expired by its own limitation in 1836, an effort was made to renew it, which received the sanction of the two houses of Congress, but the then President of the United States exercised his veto power, and the measure was defeated. A regard for the truth requires me to say, that the President was fully sustained in the course he had taken by the popular voice. His successor to the chair of state unqualifiedly pronounced his opposition to any new charter of a similar institution; and not only the popular election which brought him into power, but the elections through much of his term, seemed clearly to indicate a concurrence with him in sentiment on the part of the people. After the public monies were withdrawn from the United States Bank, they were placed in deposit with the State banks, and the result of that policy has been before the country. To say nothing as to the question whether the experiment was made under propitious or adverse circumstances, it may safely be asserted that it did receive the unqualified condemnation of most of its early advocates, and it is believed was condemned by the popular sentiment."

477. From this time the public deposits were withdrawn from the custody of any banks whatever, and kept in the treasury, and the consequence has been that while numerous crises of more or less severity have swept the country, the credit of the government, resting on the solid foundation of specie, has remained unimpaired. Having given at so great length the history of the changes in the American system of currency and banking, we need not enter into any detail of its history for the last few years, as no change in its constitution has since taken place. Our object is sufficiently answered, which was to exhibit by a sufficiently full account, drawn exclusively from native sources, the fearful curse which an ill regulated paper currency is to a country. Many persons in this country consider that paper issues are the panacea for all commercial evils, and want of employment of the working classes. But we have seen in the preceding narrative that it was the very issues of paper which brought on such frightful catastrophes in America, to which there is no parallel in this country. We have also seen how inaccurate are the views of a sect in this country, who attribute the derangement of the American currency to the overthrow of the Bank of the United States, as Sir Robert Peel did in 1844. We have seen that in mismanagement, in extravagant paper issues, in fanning vicious speculation, in misappropriating its funds to wild adventures, that Bank was the most guilty culprit of all, and so potent and mischievous was its influence in deranging the commerce of the country, that it fell amid the universal execration of the people. We say

nothing of its political intrigues, of the question of its unconstitutionality or the contrary, which do not concern the subject in an economical view. One thing is certain, that for a considerable time, the Americans have been perfectly determined not to tolerate again the institution of a National Bank. But a great deal remains to be done to put the American currency on a sound footing. It may be well perhaps in the early stages of a country to tolerate a small paper currency, but as it gets richer, it should certainly be replaced by a metallic one. The security of the notes in America is supposed to be maintained by the deposit of public stock, or mortgage on land, besides convertibility into specie. But in the Western States at least, convertibility into specie is a pure farce. It cannot be enforced, and any one attempting to enforce it would run considerable risk of being very roughly handled by the free and enlightened citizens. And the security of the funds and land does not prevent the paper being at a considerable discount. The whole system is manifestly a vicious circle, for paper is issued on the security of public stock and land, and when the stock or land is to be sold, what is it to be redeemed in? Paper. Thus there is nothing but paper to redeem paper. This is Law's theory of money which is fully examined under Law.

The following table shews the progress of banking in the United States :—

NUMBER OF BANKS IN EACH STATE.

Remarks on Currency and Banking; having reference to the present derangement of the circulating medium in the United States. By Nathan Appleton. Boston, 1841.

The Banker's Magazine. Baltimore, 1847.

A treatise on Banks and the Currency. By Condy Raguet. Translated into French by Lemaitre. Paris, 1840.

Banks, banking, and paper currencies. By R. Hildreth. Boston, 1840.

Answers to the questions: What constitutes Currency? What are the causes of unsteadiness of the currency? and what is the remedy? By H. C. Carey. Philadelphia, 1840.

Historical Sketch of the Rise and Progress of Banking in France.

478. Nothing could equal the desolation of France, during the closing years of Louis XIV. That monarch now reaped the bitter consequences of the mis-called glory of the earlier portion of his reign. He had survived all the illustrious men who had adorned the first half of it. He, who had formerly filled all Europe with such terror of his tremendous power, as to drive even the Pope into a league with the heretical Prince of Orange, had now lost all his conquests, his soldiers were beaten, his marshalls disgraced, and the frontiers of his kingdom open on all sides. He, who had carried his armies to the walls of Amsterdam, and devastated so many flourishing provinces with merciless cruelty, was now prepared to make extensive cessions of territory. For many years the finances had been in a state of the utmost disorder. Even in 1692 he had been obliged to send all his plate to the Mint to be coined. In 1706, Chamillart, the Minister of Finance, had paid the creditors of the state in paper. In 1708, Desmarets, nephew of Colbert, was made *Contrôleur Général* of finances. The winter of 1708-9 was of terrible severity, and a dreadful famine ensued. The difficulties of the state were so great, that in May, 1709, the usual resource of bankrupt despotism was adopted—a depreciation of the coinage. A general re-coinage was ordered, and the weight diminished, so that out of every 13½ old, 18 new *louis d'or* were created. Amid the general despair, the king alone, like some weather-beaten oak of the forest, bore gallantly up, and maintained his courage.

479. The king died on the 1st September, 1715, and the terrible state of the finances was the first thing that occupied the attention of the Regent Orléans. The resources of the financiers were exhausted. There were only about 7 or 800,000 livres in the treasury. The amount of the public debt was not ascertained, but it was supposed to amount to about 3 milliards, and a large portion of the securities were at a discount of 80 to 90 per cent. Manufactures were destroyed, commerce was at an end, and vast tracts of country were left uncultivated. Country gentlemen were unable to educate their children. The great bulk of Frenchmen were solely occupied in endeavouring to provide their daily food. The letters of Madame de Maintenon, during her residence at St. Cyr, are filled with details of the distresses of the people, whose pensions and allowances were stopped. Many diplomatic agents remained so long without their salaries, that they could not pay the postage of their letters.

480. The state of affairs was so hopeless, that St. Simon boldly proposed a bankruptcy. The council of finance affected to be shocked at this open avowal, but at every meeting they were occupied with devising schemes to evade the payment of the public debts. At last three methods were adopted. I. A depreciation of the coinage. II. A prosecution of the financiers, or farmers of the revenue, who were alleged to have defrauded the treasury. III. A *visa* or investigation of the titles of the public creditors, to see which might be suppressed or reduced, on the pretended ground of usury.

481. The louis d'or, which passed current for 14 livres, was called in at 16, and immediately re-issued at 20, being an undisguised bankruptcy. Of the securities called in to be verified, 250 millions were brought in, of these 55 millions were fraudulently retained by the office, and only 195 millions returned to the owners, and from the financiers 160 millions were recovered.

482. John Law (Law) had previously, in 1708, been at Paris, and become acquainted with the Duke of Orléans, to whom his social talents recommended him. He then unfolded his financial schemes to the Duke, who recommended him to Desmarests. The minister thought very highly of his knowledge, but for some reason he incurred the displeasure of the government, and was ordered to quit the kingdom.

483. On the death of Louis, Law immediately returned to Paris, and was received with open arms by the Regent. The project of the Royal Bank was renewed. Law addressed several memoirs and letters to the Regent, explaining the nature of Banks and credit, and the benefits they had produced in the states in which they had been adopted. These memoirs and letters contain nothing which is not perfectly sound, and are not tainted with that peculiar theory of money, which we call *Lawism*. The Regent supported the plan with all his power. On the 24th October, 1716, a council extraordinary was held to consider the subject, to which several other eminent persons were invited. It was proposed to erect a Royal Bank, into which all the revenues of the kingdom should be paid, and which should issue notes of the value of 10, 100, and 1000 of the current *écus*. These notes were to be payable to bearer on demand, and might be used in all commercial transactions. But their acceptance was to be purely voluntary. The council however, led by the Duc de Noailles, who was jealous of the Regent, and tried to thwart him in every way, unanimously rejected the plan, and the Regent was obliged to acquiesce.

484. The Regent, however, was determined to persevere, and having privately talked over the Members, a second sitting was held, at which Law attended to give explanations, and a project on a smaller scale was brought forward. Law only asked to be allowed to establish a private banking company, with his own capital, and to carry it on under the eye of the minister. St. Simon was the only opponent, and the letters-patent were granted on the 2nd May, 1716.

485. The capital of the Bank was divided into 1,200 shares of 5,000 livres each. Subscribers were allowed to pay three fourths in public securities, and one fourth in money. Thus, 4,500,000 livres of depreciated public stock were taken out of circulation. This we have already seen (*BANKING IN ENGLAND*, § 82) was exactly the same plan as was adopted in England to support public credit in 1697, when the new subscriptions to the Bank were received partly in its own depreciated notes, and partly in exchequer tallies at a heavy discount.

486. The Bank commenced operations in June, 1716. It was in every respect a similar institution to the Bank of England. It issued its own notes on the deposit of bullion and in the discount of bills of exchange. But what greatly increased its credit both at home and abroad

was, that it undertook to cash its notes in money of a fixed weight and fineness, and not in *livres tournois*, the current money, which varied according to the caprice of the king. It thus insured a uniform standard of payment, and put an end to those atrocious alterations of the currency, which were the terror of all dealings in credit. Moreover foreigners who placed their money in the bank were exempted from the *droit d'aubaine*, by which the property of all foreigners dying in France was confiscated to the crown.

487. The effects of the new Bank, thus insuring a uniform standard of payment, and discounting bills, was marvellous. It was instantaneously felt like magic throughout the whole country. The exchanges immediately turned in favor of France. Foreigners hastened to purchase when they were assured of a fixed currency. Merchants resumed business, manufacturers were at full work, the rate of interest was lowered. The contemporary native writers all bear witness that the recovery of the country from its state of prostration was incredibly quick. The Regent did all he could to favor the new Bank. In October, 1716, all the officers of the revenue were ordered to make their remittances in its notes, and to cash them at sight, so that all the finance offices of the state became in fact branches of the Bank. In two years 50 millions of notes were issued. By this means the Bank had become very much what it had been intended to be at its first projection. Up to this time it was eminently prosperous, and was conducted on the soundest principles, and if it had been let alone, and conducted on the same principles, it would have conferred on France the same benefits as the Bank of England did to this country.

488. But, unfortunately, Law having now attained so firm a position, in despite of the parliament, which hated him as a foreigner and a heretic, and of the bankers and money dealers whose trade he injured, began now to plan those gigantic schemes of speculation, and to carry out his own peculiar views of paper money, which ended with so terrible a catastrophe, and swallowed up this flourishing establishment.

489. Towards the end of the 17th century, some gallant French adventurers had sailed up the St. Lawrence, and discovered those magnificent inland seas, of which it is the outlet. The Indians spoke of a mighty river which ran a southerly course. Marvellous tales of the "Father of waters," reached Quebec, and a merchant named Joliet, and a missionary, Marquette, who had labored among the Indians for years, were fired with zeal to discover the mighty stream, and win fresh triumphs for the Cross. On the 10th June, 1673, these two men with five companions, to the astonishment of the Indians, who sought to dissuade them from the incredible task, struck across the country, and embarked on the Wisconsin. A voyage of seven days launched them on the Great River, which had never been seen by a European eye but once, 140 years before. The travellers descended to the village of Arkansia, a little below the junction of the Arkansas, took possession of the country in the name of France, and returned to Quebec to publish these marvels.

490. The good Marquette slept by the stream, which bears his name, the lone European

among the flock he had won to the Cross. But the torch of discovery was taken up by Cavelier de la Salle, a jesuit trader, who lived on Lake Ontario, and received a large grant of land, upon which Kingston, then called Fort Frontenac, now stands. Joliet spread the news of the new found regions as he passed, and La Salle, who was filled with enthusiasm for discovery, by reading the voyages of Columbus and De Soto, immediately conceived the idea of seizing and colonizing the country. He hastened to France, and the design suited the magnificent ideas of Colbert, who granted him a monopoly of the trade in buffalo skins, and empowered him to explore the Great River. After innumerable adventures and hardships, La Salle and his party, in 1682, navigated the river in its whole course from the falls to the sea. He took possession of this enormous tract, in the name of France, and gave it the name of Louisiana.

491. When La Salle returned to France, Colbert was dead, but his son adopted his plans. In 1684, the first colonists were sent out to take possession of the country. But their course was one series of disasters, chiefly owing to internal dissensions. They missed the mouth of the river, and landed in Texas, where the first settlement was made. After numerous misfortunes and hardships, La Salle set out, with a few companions, to make his way to Canada, but on the way some of his party mutinied, and shot him. After this the colony languished for many years. In 1712 there were but twenty-eight French families in it. In that year Louis XIV. conferred an exclusive monopoly of the trade of that vast region on Anthony Crozat, an eminent French merchant. In a short time, speculation began to be directed to the new territory, by the report of immense mines of gold and silver. But the exclusive power of Crozat gave great offence to his countrymen, who thwarted him in every way, and in 1717 he was induced to abandon his charter. At this time the French inhabitants were about 700.

492. Law immediately saw that his great opportunity was come, and that now was the time to try his currency theories on a grand scale. As Crozat was unable to keep possession of his grant, Law determined to succeed him. In August, 1717, the Western Company was erected by letters patent. The king assigned over to it, in full property, all the lands discovered, and to be discovered, in Louisiana, with sovereign rights, for 25 years. All its forts, ammunition, money, &c., as well as the beaver trade with Canada, were included in the gift.

493. The capital of the Company was fixed at 200,000 shares, of 500 livres each, which might be paid in any species of public security. This operation was similar to the foundation of the Bank of England, and Law's own Bank. One hundred millions of depreciated public stock were thus absorbed, and the creditors of the state became a vast corporation, highly favoured by it. The interest of the capital stock was fixed at 4 per cent., and was punctually paid at Law's Bank. The public securities, which were at 75 per cent. discount, immediately rose to par, and public credit was greatly benefited.

494. As far as the operation had gone, this was exactly what had been done to restore public

credit in England, in 1697, and was somewhat similar to the Bank of St. George, at Genoa, which was an association of the creditors of the state, to whom the Island of Corsica was made over in full sovereignty, as a security for their debts. And, as far as we have gone, there was nothing objectionable in the constitution of the Western Company, and if it had been prudently managed, it might, in process of time, have attained as great fame and power as our own East India Company.

495. Lord John Russell, (*History of Europe from the Peace of Utrecht, Vol. II., p. 206*), and an able French economist, M. Levasseur, in describing this operation, (*Recherches historiques sur le système de Law, p. 64*.) have found considerable fault with the mode of forming the capital of the Company. M. Levasseur maintains that it was fictitious, and that as the public securities were at a discount of 75 per cent., the real capital was only 25 millions. But his argument appears to us to be incorrect. The reason why these securities were at so heavy a discount was, that the interest was so irregularly paid. As soon as the interest was punctually paid, the value of the stock naturally rose to par,—and it was justly rated at its par value. It was the precise plan adopted in increasing the capital of the Bank of England in 1697, and no one ever impugned the operation.

496. On the 28th August, 1717, the Regent sent the edict for creating the Western Company to be registered by the Parliament, along with some others. That body declined to consider the subject until the Regent should have given in a full and detailed account of the finances of the kingdom. The Duc de Noailles, who had always hated Law, and thrown every obstacle in his way, actively opposed him. The Chancellor D'Aguesseau sided with Noailles. On the 28th January, 1718, the Chancellor was dismissed from his office, and ordered to exile himself to his country seat. The Duke hastened to resign, and both were succeeded by Argenson.

497. The Regent was mightily offended at the opposition of the Parliament, and on the 28th May, 1718, a decree for depreciating the coinage, by raising the marc of silver from 40 to 60 livres, was passed by the Council, but not sent to the Parliament for registration. On the 2nd June, all Paris was confounded by seeing the decree placarded on the walls, without the Parliament having heard a word about it. A most furious contest immediately began between the Regent and the Parliament, which at one time almost threatened a civil war. The Parliament denied that the edict had the force of law until registered by them. The Regent replied with unanswerable logic, that in an absolute monarchy the sovereign was the sole source of law, and no inferior body, who derived their authority from his will, could participate in it. He shewed by precedents, that sending such edicts to the Parliament was merely a convenient way of making them known to the public, and was not necessary to give them legal force. The Parliament, thus foiled in argument, determined to revenge themselves on Law, as the supposed author of the edict.

498. On the 12th of August, it published a decree attacking Law's Banking Company. It

ordered that the operations of the Bank should be confined to those specified in the letters-patent of the 2nd and 20th May, 1716, constituting it, and forbade it, or any of its directors, officers, or servants, directly or indirectly, to retain possession of any of the public moneys, or to make use of them in its business, under heavy penalties. That all receivers of the public moneys should keep them in their own custody, and should be personally responsible for them. All foreigners, even though naturalized, were forbidden to interfere, directly or indirectly, in the management of the finances.

499. For several days the Parliament did not dare to publish this decree, but on the 18th of August, its officers read it in the presence of the people, and copies were sent to the proper magistrates. The Council was equally energetic. It quashed the decree of the 12th of August as treasonable, and declared that in future the Parliament must make any objection to a decree within a week of its presentation, and after that time it should be held as registered.

500. The Parliament was prepared to adopt the most violent measures. It proposed to arrest Law by its officers, shut the gates of the court, hang him, and then let in the people to see his corpse. Law, warned of his danger, took refuge at the Palais Royal. Argenson was not a man to be cowed by the Parliament, and a bed of justice was immediately resolved on. At six in the morning, of the 26th of August, the Parliament was ordered to attend at the Tuileries at 10 o'clock. Every preparation had been made for the *coup d'état*, and to render resistance hopeless. Paris was strongly occupied by troops. St. Simon (*Vol. XVII., chaps. 1—9, edit. 1829*) has given the details of this great event with great fullness. The Regent gained a complete triumph. The Parliament was ordered to register the decree of the 21st August, and reminded that its duty was to render justice between man and man, and not to meddle with financial affairs. It was ordered not to delay the registration of any edict more than eight days, after that it was to be held as registered. The Parliament did not dare to disobey, the edicts were registered, and its friends otherwise humiliated.

501. The Regent had now completely conquered all opposition, and determined to carry out the plans of Law on a grand scale. On the 4th of December, 1718, a secret council was held, to which only the Duc d'Antin, the Duc de Bourbon, and Argenson were summoned, to pass an edict, prepared by Law, to carry out the "*SYSTEM*," to be presented to the Parliament. Argenson was aghast at the daring magnitude of the scheme, Antin was only a timid courtier, and Bourbon was actuated by the hope of profit. The determination of the Regent was successful, and on the following day the edict was sent to the Parliament to be registered. It was rejected by a majority of 84 to 23. Law was detested as a foreigner and a Protestant. The Parliament was alarmed at the magnitude of the scheme, and protested against the degradation of the king into a banker and merchant. But all resistance was useless: on the 12th of December, the decree was held as registered, and had the force of law.

502. By this decree the Banking Company of Law was erected into a Royal Bank. The

original capital was repaid to the shareholders, and 1,200 shares in the Western Company, which it had purchased, were held as security for its notes. These were declared to be no longer payable in a fixed standard, as heretofore, but in the current coin of the day, which was always liable to be altered at the arbitrary will of the government. From the 1st of January, 1719, in Paris, and from the 1st of March in the provinces, silver was forbidden to be used in all payments above 600 livres, which were only to be made in gold, or bank notes. As there was scarcely any gold in the kingdom, this practically made bank notes the only legal tender for such sums. Five branches were established, at Lyons, La Rochelle, Tours, Orléans and Amiens.

503. In August, 1718, the first party of colonists, 800 in number, in three vessels, arrived safely at their destination, and the City of New Orléans was founded on an advantageous site, which had been selected in anticipation of their arrival, as the capital of the new empire. But the shares of the Company had fallen to a heavy discount at home. They were only at 300 livres in the market, and the enterprise was languishing. Law saw that it was necessary to adopt some financial operation to raise their value. He bought up two hundred at par, to be paid in six months, and he offered to forfeit 40,000 livres, if he failed in his engagement. This gave the public more confidence, persuaded that the author of the scheme would not risk so much of his own means in it without solid grounds, they began to buy them up, and they soon rose to par.

504. The government and possession of such a gigantic territory, as Louisiana then was, would have been sufficient to have satisfied the ambition and talents of most men, but this was but a small part of Law's audacious scheme, which was nothing less than to absorb the whole trade and finances of the country. He began by buying up and absorbing every rival company that stood in his way, and for each absorption new shares were created. In December, 1718, he acquired the monopoly of the Atlantic trade, and bought up for 1,600,000 livres, the privileges and stock and materials of all sorts, including eleven well equipped vessels of the Company of Senegal. He also bought up the monopoly for nine years of the manufacture and sale of tobacco, for an annual rent of 4,020,000 livres. It had previously yielded only two millions. The state thus gained two millions, and was, in fact, released from the payment of the interest on the capital of the Company.

505. The company began now rapidly to push on its operations. In May, 1719, it had 3,577,000 livres in its coffers, a fleet of 21 vessels, and an immense quantity of merchandize. In the beginning of 1719, ten vessels were sent out with 700 soldiers, and 500 colonists, and great quantities of stores of all sorts. The colonists who had preceded them had satisfied themselves of the inexhaustible resources of these untrodden regions.

506. With one or two insignificant exceptions, the whole ocean commerce of France was now given over to the company, and that of the Mediterranean was soon added to it. In July, 1719, it absorbed the African Company, and on this occasion 50,000 new shares were created,

which were payable in bank notes, or gold, or silver.

507. What a position for this Scotch adventurer! A fugitive from his own country, and dismissed from several of the Courts of Europe, he had now vanquished the Parliament, the highest princes of the blood, and the chancellor D'Aguesseau. He was in absolute possession of a vast territory, and all the maritime commerce of France, which had no communication with foreign countries, except through the intervention of his Company. He now determined to bring all the resources of stock-jobbing into play, to force up the value of the shares. The 50,000 new ones were issued at a premium of 10 per cent. This at once netted a profit of 2,500,000 for the company. Two months after, the original shares were at 1,000 livres. Speculation now fairly set in, and such crowds rushed to buy, that Law made an edict on the 30th June, that each purchaser of a new share, must possess four old ones. The original shares were called *mères*, and the new ones *filles*. To find the means of purchasing these shares, the Bank created, by two ordinances, of the 10th June, and the 20th July, notes to the amount of 290,000,000 livres, and it then had 400 millions in circulation, and on the same day, the privilege of coining money for nine years was ceded to the Company.

508. On the 27th July, 50,000 shares of 500 livres were created, and issued at 1,000, to pay for the coinage monopoly, for which Law had agreed to pay 50 millions, in 15 equal monthly payments. No one could obtain one of these new shares without presenting *four mères* and *one fille*, and they were called *petites filles*. Law still further stimulated jobbing, by promising two annual dividends, of 6 per cent. each. On the 27th August, the company obtained a grant to farm all the indirect taxes of France, at an annual rent of 52 millions, and on the 27th September, the greater portion of the remaining taxes, too numerous to mention. It is only justice to say that immense improvements were effected in their collection. Hosts of petty tyrants were swept away, and all taxes were paid direct to the Company, to the great relief of the taxpayers. Law further made great efforts of the most enlightened nature, to diminish the impediments to commerce, to improve communications, and to overthrow the system which had been reared with so much unhappy industry by Colbert. The Company voluntarily abandoned the monopoly of the sale of tobacco, and declared the trade free, but subject to a moderate duty.

509. Law now undertook a great financial operation, no less than to pay off the remainder of the national creditors. For this purpose, he undertook to advance to the state 1,500 millions, for which he was to receive three per cent. interest, which would relieve the treasury to the amount of 15 millions a-year. This was done by the creation of new shares. On the 13th Sept. 1719, 100,000 new shares were created of 500 livres, but so strong was the tide of speculation, that they were issued at the price of 5,000 livres, but the buyers might pay in ten equal payments of 500 livres. Thus, one third of the payment was provided for at a single stroke. The facility of paying by instalments created a fever of speculation. People rushed in to buy, with the

hope of selling again at a profit. We must refrain here from giving the amusing anecdotes to be found in all writers on this crisis, and some of which are given under LAW, as we are dealing here only with financial questions. The new shares rose, in a few days, to 8,000 livres. By decrees of the 22nd and 25th September, payment might be made in Government securities, or bank notes.

510. The success of this issue was so great, that on the 28th of the same month a fresh creation of the same amount, and on the same terms, was made. On the 2nd October, a third issue of the same amount completed the 1,500 millions, promised to the state, and Law was now so independent of the authorities, that, on the 4th, a supplementary issue of 24,000 shares was created, without even the formality of a decree. As the time for paying the instalments drew near, the price of the shares began to waver, as most persons had bought them with neither the intention nor the means of paying for them, but only for speculation. As the consequences of a decline might have been fatal, a decree of the 20th Oct. ordered, that the nine last payments, which should have been made monthly, should be made at three intervals, of three months each. The purchasers had thus two more months to speculate with them, and the price continued to rise, and soon reached 10,000 livres. In less than three years the paper obligations of Law amounted to ten milliards, or about £400,000,000 of nominal value. Of these, 6,338 millions were shares of different sorts, and the remainder bank notes.

511. Speculation was at its height during the last months of 1719; in November and December the shares reached the price of 10,000 livres. As usual, under such circumstances, a number of persons began to see that the delusion could not be kept up much longer, and began to realise, and carry away the proceeds out of the country, in specie and jewels. The prices of merchandize and the necessaries of life rose immensely. Coffee rose from 50 sous to 18 livres the pound; wax candles from 32 sous to nine livres; cloth rose to 25 livres the ell; velvet to 42. A hackney coach cost 40 livres the day; silk stockings 40 livres the pair, and everything else in proportion. On the 16th January, 1720, the Parliament undertook the impossible task of attempting to lower the prices, and diminish the scarcity of articles of prime necessity. Its efforts, of course, were useless, and it soon gave them up. The excessive dearth of food and necessaries fell with great severity on clerks, and small annuitants, and workmen, who received no increase of wages proportionate to the rise of prices, and who were paid in bank notes. Shopkeepers, however, and all traders, soon made a very sensible difference between payments in cash, and payments in paper.

512. Law now felt that the whole edifice of this bloated credit was tottering, and the most violent measures were resorted to to sustain the value of the paper, just as always has been done in similar circumstances. The extraordinary creations of bank notes fully explain this. While Law's private bank existed, it only issued 61 millions of notes in eighteen months, and it had 32 millions of specie in deposit. But when the bank became the Royal Bank, and Law's theory

of money was fully carried out, the following creations were made by Royal ordinance, in one year, 1719 :—

On the 5th January	18,000,000 liv.
11th February	20,000,000
1st April	21,000,000
10th June	50,000,000
25th July	240,000,000
12th September	120,000,000
24th October	120,000,000
29th December	860,000,000
	<hr/>
	949,000,000 liv.
Notes of Law's Bank	61,000,000
Amount of forged notes supposed to be in circulation	50,000,000
	<hr/>
	1,060,000,000 liv.

This enormous issue created so much alarm that it was publicly announced that no more should be issued on any pretence. They were already at a heavy discount;—at Lille, at 18 per cent.; in Burgundy and Champagne, they were utterly refused. People preferred to make no sales at all, rather than take them. In February, 1720, there was almost an émeute in the market of Poissy. The butchers refused to receive the notes in payment of meat, and Paris was in danger of being starved, if specie had not been sent to them.

513. Law seeing the danger of the credit of the notes being entirely ruined, adopted the most violent measures to throw discredit on specie, and drive it out of circulation. The shares of the Company could only be paid for in public securities and bank notes, specie was altogether refused. On the 1st of December, 1719, the bank was forbidden to buy any more specie with its notes. The Company was ordered to receive nothing but notes in payment of taxes, bank notes were made the only legal tender, creditors were ordered to disregard all offers of payment in money. In commercial transactions no payments of greater amount than 10 livres in silver, and 300 in gold, were allowed. For lower amounts, the Company only received specie at a discount of 5 per cent. Bills of exchange could not be paid in money. The bank relaxed its rule a little, and agreed to sell its notes for gold at a premium of 5 per cent. On the 28th January, 1720, another proclamation made notes legal tender throughout the kingdom, and on the 28th April, all who paid their taxes in notes were allowed a discount of 10 per cent.

514. In issuing this immense quantity of paper, Law was only following out the principles of his system, and indeed it is only just to say, following out to its legitimate conclusion, the prevailing theory of money of his day, and one which is even now very extensively prevalent. But when he saw it producing the fruits of a false theory, he utterly broke through all his own principles. In his *Mémoires sur les Banques*, and his letters to the regent, he had strenuously maintained the doctrine that the king should never tamper with the coinage, or alter it in weight, fineness, and denomination. In his treatise, *Money and Trade considered*, which is a full exposition of his theory, he does not hesitate to stigmatise all tampering with the coinage, as fraudulent and delusive, and the special object of his plan was to create a paper currency which

should maintain an equality in value with specie. But henceforth he followed the opposite course, instead of making the paper correspond to the value of the specie, he tried to make specie conform to the value of the paper, exactly what so many persons maintain ought to have been done in England in 1816, when there was a difference of 25 per cent. between bank paper and gold, but which he had always reprobated. Between September, 1719, and December, 1720, there were twenty-eight alterations of the value of gold, and thirty-five of that of silver. In May, 1719, the louis d'or had been fixed at 36 livres, on the 25th July, it was reduced to 34, on the 23rd September, to 33, and on the 3rd December, to 32, on the 1st January, 1720, to 31, and on the 1st February, to 30. But the law that bad money drives out good had begun to operate, at the first reductions every one had rushed to deposit his money at the bank, and get notes, but at these successive reductions, which seemed to have no end, they hastened to export their money, rather than lose five livres on every louis. On the 22nd January, 1720, they were restored to their former value, and absolute freedom of export was allowed, without a passport. But it was only a trick; no sooner had money again come into circulation, than on the 28th, it was again lowered to 34 livres. But for three days gold was to be received at 900 livres the marc, at the Mint. Multitudes of persons hastened to disembarass themselves of money which was such a source of annoyance to them. The bank was filled, and money was again proscribed, and it was forbidden to carry it out of any town where there was a mint. People were not even allowed to keep their money in quiet. Large quantities had not been brought in under the edict of May, 1718. In December, 1719, the Company was authorised to make domiciliary visits, and seize all the decreed money they could find, and on the 28th January, 1720, this was extended even to religious communities, and other privileged places. Soon afterwards, diamonds, precious stones, and even gold ornaments were prohibited. On the 27th February all persons whatever, as well as bodies corporate, were forbidden to have more than 500 livres in specie, under a penalty of 10,000 livres. Nor were the Company slow to put these decrees in force, several very extensive seizures took place. No place escaped search. The brothers Paris, conspicuous antagonists of Law, were detected exporting seven millions, which was seized, as well as an equal sum found on searching their house, and confiscated to the Company. Universal distrust followed, servants betrayed their masters, neighbours informed against their neighbours, and even kindred and friends denounced each other. The royal dukes made enormous sums out of Law, and the Prince of Conti, when some slight check was at last placed upon his rapacity, was the first to attack the bank. He collected all his notes and demanded 14 millions in specie for them, which he carried away in three waggons. The Duc de Bourbon drew out 25 millions.

515. On the 30th December, 1719, when the system was at the height of its prosperity, a General Meeting of the Company was held. The Regent presided, the royal dukes sat in the crowd among all sorts of people, who had

speculated luckily; the directors were 30 in number, and comprised nearly all the former farmers-general of the revenue, but Law was the real manager of the whole concern, and guided the whole assemblage at his will. He had now great cause for alarm. The extravagant height to which the shares had been raised, could not be maintained on the dividend of 12 per cent. promised to the original shareholders, and if no more could be promised, it was clear that the shares would soon go down again, and might possibly overturn the whole scheme. The real value of the shares of course ought to depend upon the dividend earned; Law determined to accommodate the dividend to the price of the shares. Of 624,000 shares which had been created, the king held 100,000, and the Company the same number, so that only 424,000 were in the hands of the public, for which dividends must be provided. But the engagements the Company had undertaken left nothing to provide an adequate dividend. The balance sheet put before the Company showed profits, which only existed in imagination, or at least in the hopes of the future. The shareholders were not too curious in investigating the figures put before them, which shewed a profit of 91 millions. And in future it was determined that the Company should pay a dividend of 40 per cent., on the original price of the shares, or 200 livres per share. That day speculation carried the shares up from 11,000 to 15,180 livres, and on the 5th of January, 1720, to 18,000 livres.

516. If it had not been for these fatal theories of paper money, and this extravagant speculation, the Company had every prospect of success. It had surmounted its first difficulties of colonization; at the end of 1719, thirty vessels sailed for Louisiana, and the coast of Africa. Rich consignments were sent to the East Indies, and to Spain. In the beginning of 1720, a fleet arrived, freighted with merchandize to the value of 12 millions. Belle Isle in France was ceded to it. Lorient, which had been given by Colbert to the former Company of the Indies, was nothing but an obscure village when it passed into Law's hands, and it was made the head quarters of the Company's trade. Immense magazines and workshops immediately started up, and in 1730, it already numbered more than 14,000 inhabitants. In Louisiana everything promised well. Colonists were attracted by liberal promises of land. In February, 1720, 800 families engaged to go out, and people 40 villages; each family was to receive 280 arpents as a free gift, and was exempted from all taxation for three years, and after that the taxes were never to exceed 10 per cent. of the products of the soil. On these terms numbers of persons started for the colony. Law bargained with the Elector Palatine, and other German princes to furnish 12,000 emigrants, and of these 4,000 were actually sent at his expense. The Company conveyed them free to the country, and provided boats to take them to their allotments, and gave them food and seed for the first year. Law took a large concession in his own name, and the persons who presented themselves as emigrants were so numerous, that the Company's vessels were not sufficient to carry them.

517. These measures promised success, and if they had been patiently carried out, there was

every prospect that in time Louisiana might have been raised to a great and wealthy country, which would have brought in boundless revenues to its proprietors. But, unfortunately, from the fatal effects of speculation, the price of the shares had been forced up so high, that immediate profits were required, and to accelerate these, very violent plans were adopted. Not content with the natural tide of emigration, every means was adopted to force it. The country was parcelled out into Duchies and Marquisates, and they were attempted to be peopled with despotic violence. The police of Paris made a general *razzia* on what they were pleased to term the vagabonds of the city, but among them numbers of respectable and well-to-do shopkeepers were seized. All prisoners were sentenced to be transported to Louisiana, in lieu of all other punishments, the houses of correction were emptied, and even ecclesiastical offences were visited with the same penalty. No proper provision had been made either in Paris, or on the journey, or in the colony for such multitudes of people. They were kept in barns, without food, and died in scores, and they filled the air with their cries, which raised the public indignation to a high pitch. To excite the public, the most fabulous reports were spread of the marvellously rich mines of gold and silver which had been discovered, ingots of bullion were carried about the streets, which it was pretended came from there. Pictures were published, showing the arrival of the colonists in their earthly Paradise, and the savages running to submit themselves to their new masters. The background was filled in with mountains of gold, silver, copper, lead, and quick-silver. The savages, who knew nothing of the value of these riches, were represented as bartering large lumps of gold for European trinkets. Others were shown demanding baptism, with enthusiasm. The solid result of all this was the foundation of the great city of New Orleans.

518. The extravagant rise in the price of the shares greatly disquieted Law. He had only wished to set the public really in motion to carry out his schemes; when that was done, it was greatly against his interest to carry speculation further, which could only end in a convulsion. He now became alarmed. A second general meeting of the company was called on the 22nd February, 1720. The bank and the company were consolidated. The quantity of notes could not be increased without the consent of both parties, confirmed by a royal decree. The extravagance of the Court was curbed. The king could not draw on the bank for more than he had in it,—and the cashiers of the bank were forbidden to honor his drafts to a greater extent. In order to support the credit of the notes, and to diminish their quantity, the company ceased to take five per cent. for notes in exchange for specie. Notes were declared the only legal tender above 100 livres. Those of 10 livres were to be called in in two months, and paid; and among other things, all the shops for trafficking in the shares were shut up. But one part of these resolutions was immediately abandoned, although the company had determined to stop the advances to the king, and to request him to deposit his shares with them, they agreed to

advance him five millions a month, which could only be done by creating new notes.

519. The good effect, consequently, of the resolutions curbing future creations, was but transient. It was seen that the promises would not be kept, and the shares immediately began to go down. In December, 1719, it was promised that no more should be made, and yet in February 1720, 200 millions were created on pretence of replacing some of these already out. They were in a great part issued before the old ones were called in. Nor were the promises of the 22nd February better kept,—new shares were sold, and all the acts of violence were repeated. But nothing could avert the inevitable doom of the system. Law had promised a dividend of 200 livres on 424,000 shares—but where was it to come from? There were no sufficient profits. This would give the final blow to the company, whose shares were already going down, as well as to the bank. There was but one method of staving off ruin—new decrees—new tamperings with the coinage. The price of the shares as fixed at 9,000 livres, and bank notes and shares were declared to be mutually convertible at that rate. The treasurer of the bank was ordered to demand payment of all commercial bills at maturity. This would bring in 174 millions. Bank notes still were allowed a difference of four sous in the livre, and a discount of 10 per cent., as compared with specie, in the payment of taxes. The marc of silver was raised to 80 livres,—the marc of gold to 1,200, écus to eight livres, and the louis d'or to 48.

520. By the measures taken, the shares of the bank were reduced by one-third, and it was hoped that fixing the price would stop the fall, but this did not help the bank, which had one milliard (£40,000,000) in circulation, and no means of withdrawing it, or even of stopping its issues. The shares were now selling at 8,000 livres,—Law offered 9,000 for them; numbers, of course, rushed to sell them at that price, and that affected the credit both of the shares and the notes. A severe blow was given to the system by a decree of the 11th March, 1720. It said that in order to lower the price of necessities, and facilitate commerce, it was expedient to diminish the value of specie, and abolish the use of gold. The louis d'or was ordered to pass for 42 livres, during March, 36 during April, and to be no longer money after the 1st May. The écus were to be proportionably reduced, and were all to be brought into the Mint by the end of 1720. Nothing but paper was to be used, and the ten livre notes, which had been suppressed in February, were continued in circulation.

521. These decrees created a perfect panic. Before the end of March, 44,696,190 livres in silver were paid into the bank, and in a short time none but silversmiths and jewellers were allowed to keep any gold or silver. But they aroused a resistance of so threatening a nature, that they were obliged to be modified, and at the end of May, louis d'or were allowed to circulate at 49 livres 10 sous, and écus at eight livres five sous. In June, new alterations were made, but by that time the bank note was so thoroughly distrusted that people began to prefer specie, with all its inconveniences, to the paper.

522. Some time before this, Law had been

made Contrôleur-Général of Finance. He, of course, had been the moving power of the whole thing all along,—and, in fact, he had been little less than Prime Minister of France. But his religion (such as it was) prevented him being made an ostensible minister. To enter the ministry, it was necessary to be converted to the Catholic faith. A fitting instrument was soon found. The Abbé Tencin, who, even in that age, was notorious for profligacy, was selected to have the honor of the conversion. The Abbé and his neophyte were shut up alone. The lucubrations of these worthies on the Christian verities never transpired. But they were doubtless of surpassing depth, for, in a very few sittings, Law was converted to the Catholic faith, and the result to the Abbé was an immense donation of shares. One little speck shortly after dimmed the reputation of the pious Abbé. A few weeks after this great argumentative triumph, he was fully convicted, in open court, of the most wilful and flagitious perjury. This little accident somewhat disconcerted his pupil; but he was consoled by the appointment of Contrôleur-Général of Finance—equivalent to that of Prime Minister of France.

523. It had been ordered that no more notes should be created, but as every one might sell their shares at a fixed price, they could not be stopped. The resolutions to forbear new issues were soon disregarded, and the following new creations took place:—

On the 26th March, 1720	800,000,000
5th April	369,000,000
19th April	438,000,000
17th May	862,000,000

By this time there were considerably more than 2½ milliards (£100,000,000) in circulation. As soon as Law found that the shares were falling, he endeavoured to put down jobbing in them. The offices in the Rue Quincampoix were shut up. But, of course, private jobbing could not be stopped; new decrees forbade it on pain of a fine of 3,000 francs, and imprisonment. He also tried to put down other investments, or at least, to make them less profitable than the dividends of the company. By an edict of March, the rate of interest was fixed at 2½. The Parliament, which had been silent ever since its humiliation in August, 1718, summoned up courage to remonstrate with the Regent. On the 18th April it was received at the Tuileries. It declared that all persons who had the misfortune to have their property invested in government securities had suffered more injury in six months of peace, than in twenty years of war. It described in vigorous terms the misery of the fundholders, the uselessness of payments in paper, the discharge of debtors, the rise in the price of food, and said that the edicts would ruin all the magistrates in France. But this remonstrance was treated with the same contempt that all others had been.

524. On the 16th May, 4 millions of life annuities had been created, chargeable on the Company, in order to withdraw 4 millions of bank notes, and on the 21st an edict was issued which gave the final blow to the whole system. The edict recited that before the establishment of the bank, the high price of silver had caused more evils to the kingdom, than all the extrava-

gance and the wars of the late king. That lenders demanded more interest in a month, than the law allowed in a year. That many of the nobility had been forced to sell their estates at a low price, in order to maintain themselves in his Majesty's service. They had no resource but his Majesty's favor, and he was unable even to pay the salaries of his officers, and the pensions awarded for good services; manufactures, navigation, and commerce had nearly ceased, the merchant was bankrupt, and the workman obliged to leave his country, and seek employment abroad. Amid the universal misery, the lender of money alone enjoyed abundance. By the establishment of the bank, and the Indian company, the king had restored order to public affairs. By raising the price of land, the nobility were relieved, commerce and navigation re-established, the fields cultivated, and the workmen employed. Notwithstanding the benefits of these establishments, people were found so evil disposed as to wish to injure them, which had obliged his Majesty to issue the proclamation of the 5th of March, to support the credit of these necessary institutions, by depreciating the coinage. By this all securities were reduced to one species, notes and shares were made mutually convertible at fixed rates. His Majesty was bound to see that the interests of minors, hospitals, and religious communities were duly protected. These had been cared for by the edict of the 11th of March, which ordered the reduction of the price of paper. But as this reduction must produce a diminution in the price of food, furniture, merchandise, and land, his Majesty considered that the interests of his subjects demanded that the money price of shares and Bank notes should be diminished, to maintain them in a just relation with specie, and other commodities, and prevent other inconveniences. His Majesty had the more willingly agreed to the reduction, because it would be beneficial to the holders of shares and notes themselves, and they would procure 50 per cent. more specie for them than they could at present. For these reasons the Company's shares were to be gradually reduced from 9,000 livres, their present rate, to 5,500. A reduction of 500 livres was to take place on the 22nd of May, the day after the edict, a further reduction of 500 on the 1st of July, and then a reduction of 500 livres on the first of each succeeding month. Bank notes were to suffer a successive reduction of 5 livres at the same times, until they were reduced to 50 livres. But the king would receive them at their present value, in payment of taxes, and the purchase of life annuities, till January, 1721.

525. This edict spread the utmost consternation throughout the country. It is even uncertain who its author was. The Council of the Regency and the Parliament were having their vacation. Saint Simon and most of the other Members of the Council were in the country. Dubois, Argenson, and Law alone remained with the Regent. Saint Simon expressly says, that Argenson, who was now Law's enemy, was the author of it, and proposed it for the purpose of ruining him. Saint Simon ought to be an unimpeachable authority. But other writers say, that Law himself was the author. At all events, whoever was the author, it was decided upon by

a very small minority of the Council. Whenever the more influential Members heard of it, they addressed the most earnest remonstrances to the Regent. Saint Simon complained that he was never listened to. The Duc de Bourbon was furious at the loss of half his property, and could only be appeased by the gift of 4 millions. The people threatened a revolution. Many pamphlets were published against Law, and the Regent. Letters were sent about Paris, saying that a Saint Bartholomew would be enacted on Saturday and Sunday, unless things were changed, and advising people to stay at home. Crowds collected in the neighbourhood of the Bank, uttering menacing cries, and on the 25th the windows of the hotel Mazarin, where the Bank was, were broken with showers of stones. The Parliament sided with the people. It met on the 27th, and demanded an audience; which the Regent did not dare to refuse, and was obliged to behave civilly to them. Law in vain tried to allay the rising storm, by publishing a letter stating the grounds of the decree, and shewing that the people would lose nothing, as the marc would be reduced to 30 livres. No one would listen to him. The Court and the Parliament were infuriated, and in spite of his protest, the Duc d'Antin persuaded the Regent to quash the edict of the 21st May.

526. At 11 o'clock the Parliament received the answer of their committee; the people shouted for joy as they believed the Directors of the Bank were going to be hung, as fraudulent bankrupts. The Regent had up to this time supported Law in public, in the most ostentatious manner. On the 25th he had taken him to the opera, but after the 27th, he was obliged, for form's sake, to abandon him for a while, and take council with the opposite party. Law was dismissed from his office of *contrôleur-général*, and the administration of finance divided into five departments. The Major of the Swiss guards went to take possession of Law's hotel. He went with the Duc de la Force to call upon the Regent, he was publicly and ostentatiously refused admittance at the front door. The next day he was smuggled in by the backstairs.

527. On the 29th of May, the edict of the 11th of March was repealed, specie was restored to its old value, and every one was allowed to have as much as he pleased. Two of the new intendants of Finance went to the Bank, to examine its affairs. They found 21 millions of specie, 28 millions in bullion, and 240 millions of bills of exchange, to support the credit of 3 milliards of paper.

528. As soon as the first burst of public fury was over, Law was restored to favor. But instead of controller of finance, he was made councillor of state, intendant-general of trade, and director of the Bank. Law thus triumphed once more over his enemies. Argenson was dismissed, he retired to apartments he kept in a convent, and soon afterwards died of grief. For three years D'Aguesseau had been pining in solitude at his country house, seeing the hopes of advancing his family blighted. Law took with him Confians, a cousin of the Chancellor's, and went to his house. The one cajoled him with promises of advancement, and the other menaced him with perpetual exile if he did not yield. They

prevailed, and brought him back to Paris. He was restored to his honours, but not to the esteem of the people, who ceased to respect him, when he came to associate his name with bankruptcy and ruin.

529. The Company was ordered to make up a balance sheet, which was ready by the 3rd of June. It shewed 300 millions in cash, large commercial adventures in progress, 500 large vessels besides smaller ones and frigates, rich cargoes, immense improvements made in the collection of taxes, well kept books, and in short, a state of affairs by no means desperate. To surmount its present difficulties, it proposed to reduce its shares, and make a call of 3,000 livres on each. Of its shares only 194,000 remained in the hands of the public, the king had 100,000, the bank and the Company itself, 330,000. The Directors requested the king to abandon his, and promised to destroy such a number of their own as would reduce the whole number to 200,000. They offered to convert the 25 millions, which they received annually from the state into annuities, and to such of their shareholders as paid the call of 3,000 livres, they promised to give 3 per cent. instead of 2½.

530. The Regent immediately adopted these measures, and the call was authorised to be paid either in notes, or shares, which were to be received at 6,000 livres. The parliament gladly registered the edicts, which gave hopes of the restoration of public credit, and a temporary good feeling seemed restored between the court and the parliament. But unfortunately it did not last. However rigorous these measures were, and however effective they might have been at an earlier period, they were now too late to restore public confidence. Few paid the call on their shares, the greater number preferred to have 2½ per cent. on their capital, than to risk new capital and its interest. The bank notes sank lower and lower, and the 600 millions which had been expected to be withdrawn, remained in circulation. No one cared to demand the stock. On the 11th of June, it was determined to burn all the notes of 1,000 up to 10,000 livres, as they came in to the bank. But none came in. On the 26th the company was authorised to create 100 millions of notes, from 100 to 10 livres, to be stamped with the word *division*, and to be exclusively given in change for the large notes, a good number were exchanged, but credit was not improved. The bank opened for payment of its notes on the 1st of June, and paid these of 100 livres, but it was soon obliged to restrict its payment to those of 10 livres. An immediate run commenced upon it. Dense crowds of workmen and small tradesmen, whose sufferings from the depreciation of the paper were dreadful, besieged the doors, day and night, and filled the neighbouring streets, in compact masses. Many remained for nights in the streets, until they got a chance to get inside the bank. Nearly every day several persons were crushed, or trampled to death by the infuriated mob.

531. These scenes continued for five weeks; at last, on the 6th of July, the money was exhausted, and it was notified that the exchange of large notes for small ones, and the payment of the latter in cash, would only take place twice a week, on market days, at the offices of the com-

missaries of the quarters, but this produced little relief. Not more than about 360,000 livres could be paid away in a week, and this was quite insufficient to satisfy the wants of the people. The disorder, instead of diminishing, increased. Payments were obliged to be resumed at the bank, and change in specie, to the amount of 10 livres, was given to each one. To prevent famine and revolt, 400,000 livres a week, were sent to the market of Poissy, 50,000 to another of the markets, and large sums in specie were given to the manufacturers to pay their workmen. Still the relief was imperceptible. With upwards of £100,000,000 of paper in circulation, the liquidation attempted was a mere drop in the ocean. On the morning of the 17th July, 1720, an unusual crowd collected round the bank. At three in the morning, there were already 15,000 persons waiting the opening of the doors. The crowd kept continually increasing, and in a short time 12 or 15 persons were trampled to death. The sight of the dead bodies infuriated the crowd. They were placed on litters, and the mob rushed with furious cries to Law's house, and attacked it with showers of stones. They carried one body to the Louvre, where the king resided, and three others to the Palais Royal, to inflame the people against the regent. The regent was absent, but the members of the council, at the hazard of their lives, tried to pacify the raging populace. The dead bodies were ordered to be taken with the utmost respect to a church, and buried at the public expense. The tumult raged for hours. The Palais Royal was filled with troops, and the gates opened. As soon as the mob had rushed in, the gates were closed, and the crowd was separated. At 10, Law took refuge in the Palais, and did not venture out for ten days.

532. The Regent proposed several measures to the Parliament to withdraw the paper notes, which were now said to be reduced to about 2,200 millions, but the Parliament rejected them all. The Regent, in a rage, exiled them to Pontoise, on the 18th of July, and they were forced to register the edict of their own disgrace. The people were indignant, as they thought they had lost their only protectors, and most of the public bodies sent deputations to them. The Regent tried to throw all the blame on the Parliament, but the people were not deceived. They became more irritated and seditious every day. The bank had finally stopped payment on the 17th July, and the prices of everything rose from the depreciation of the paper. The people, in their misery, threatened assassination. The mother of the Regent received threatening letters, saying, that 200 bottles of poisoned wine had been prepared for him, and that if that failed, a new kind of fire had been invented to burn him alive, in the Palais Royal, and herself at St. Cloud.

533. In the beginning of August little papers were thrown into the houses and carriages, with the words "Sauvez le roi, tuez le tyran, et ne vous embarrassez pas du trouble." The city was everywhere placarded with a *chanson*, sung in every drinking house:—

"Français, la bravoure vous manque,
Vous êtes pleins d'aveuglement:
Pendrez Law avec le régent,
Et vous emparerez de la Banque,
C'est l'affaire d'un moment."

A parody of the last scene of *Mithridate* was stuck up on the very door of the Regent's room, in which he and Law were represented as triumphing over the ruin of France. The Regent, in a rage at the atrocious calumny, cried out before his friends, that he would give 100,000 crowns to discover the author. The next day, there was written on his door—

"Tu promets beaucoup, ô Régent,
Est ce en papier, ou en argent?"

The Regent suspected the Abbé de Villier to be the writer of this insult, and had him assassinated near the Port Neuf, on the 28th.

534. One of the means proposed by Law for withdrawing the paper from circulation, was to open a current account at the bank for 1,200 millions of paper, on the principle of the banks of Holland, and by purchases of the shares of the company. In every town where there was a mint, the merchants were ordered to bring in their notes of 1,000 and 10,000 livres, which were to be cancelled before them, and they were to receive an equal credit in the bank's books, to be drawn upon with checks, with which they were to pay and receive all their debts. All money paid into their account was to be exempted from depreciation and seizure, on any pretext whatever. All bills of exchange of 500 livres and upwards, and wholesale transactions, were to be settled by these means. All others were to be void, and to subject both parties to a penalty of 500 livres to the bank. Another edict gave the company a perpetuity of its rights of trade, on the condition of withdrawing 600 millions of paper, at the rate of 50 millions a month. To do this, it had no means but creating shares. To confirm the confidence of the public, all its privileges were solemnly confirmed to it on the 22nd of July. Two edicts of the 31st July, and the 14th of August, authorized the creation of 50,000 and 20,000 shares of 12,000 livres each, to be issued at 9,000 livres, and paid in bank notes. The company thus hoped to withdraw 630 millions. But the delusion had passed away, very few shares were bought, and only 200 millions of notes were brought into the current accounts. On the 29th of July, the marc of silver was raised to 120 livres. On the day after that the bank notes were at par, but by the end of August, after many fluctuations, they had fallen to 33 livres.

535. The affairs of the bank were utterly desperate, no financial operation could save it. During July it alleged that 597,756,030 livres of its notes had been burnt, but this was said to be an exaggeration. The opening of the current accounts and the creation of stock had absorbed 700 millions, but on the most moderate calculation 1,400 millions still remained in circulation, and there was no possible means of withdrawing them. All the cash was exhausted by the 17th of July. It was then finally resolved to abolish the bank. On the 28th of August two edicts were sent to the bank, to create 4 millions of life annuities, and 8 millions of perpetual annuities, to be paid for in bank notes of 1,000 and 10,000 livres, which were to have no currency after the 1st of October. The 100 and 10 livre notes were to be received in commerce till the 1st of May, 1721. All payments above 1,000 livres might

be made in specie, and notes were only to be received at their nominal value in payment of taxes. In September 100 millions of 50 and 10 livre notes were created, to satisfy the holders of the large notes, who complained much of the compulsory conversion of their notes into annuities. They were allowed to have one-tenth of their capital in money. These measures, however, did not restore the credit of the notes, which continued rapidly to fall. On the 15th of September the 100, 50, and 10 livre notes were ordered to be received without specie in payment of debts till the 1st of November. From the date of the edict notes of 1,000 and 10,000 livres, and from the 1st of November, the other notes could only be tendered along with one-half of the debt in specie. One-fourth was to be struck off the credit of the current accounts, unless the creditors would receive them in 1,000 livre notes. Repeated alterations were made in the value of the coinage.

536. All these measures had but a very slight effect in reducing the paper money. With all the shares, annuities, and current accounts which had been made since the 1st of August, only 30 millions had been brought in by the public. Only 100 millions were burnt in August, not a single note in September. The treasurers of the state and the company held only 90 millions. There were still 1,369,072,540 in the hands of the public, which no ingenuity could call in.

537. On the 10th of October, 1720, the final doom of the bank was pronounced. The decree ordered that, after the 1st of November, no bank notes could be given or received in payments, on any pretence whatever. From the day of the decree all taxes must be paid in specie. The king and the company also engaged to pay their creditors in specie. Thus fell the bank, drawing with it all the miseries incidental to such a catastrophe, which may be imagined, but need not be described.

538. The company was involved in the fate of the bank, although Law used all his endeavours to separate them. On the 29th of August its organization had been changed, and Law named director-general. The Regent became protector and governor. It was henceforth to confine all its operations to commerce, and in order to increase its profits, its privileges were extended. It obtained the only two exceptions to its monopoly of maritime commerce—that to St. Domingo and Guinea—the former was granted on the 10th of August, and the latter on the 27th, in perpetuity. But the shares did not rise. In August the company had bought in 100 millions of its own shares; in September they were fixed at 2,000 livres. The directors were authorized to create 50,000 new ones, in tenths, of 200 livres each, to be issued at 800 livres, and to be paid for in bank notes. Three-fourths of the value of the shares being struck off by an arbitrary edict, no one came forward to buy the new ones. On the 5th October a decree rendered compulsory the call of 3,000 livres per share, and all shares not paid upon were to become stock, with only 2 per cent. interest.

539. These decrees were fruitless to prevent the fall in the value of the shares. It would be tedious to relate all the acts of violence resorted to in the desperate endeavour to sustain their

falling credit. They were then at 2,000 livres in bank notes, which were only worth 200 livres in specie. The panic was doubled on the 27th of November, when it became known that the company had borrowed 22½ millions at 4 per cent., to carry on their trade and pay a gift of 20 millions they had promised to the king, on the last tampering with the coinage. This gave the final blow to the shares; they were then sold for a louis d'or.

540. This was the final ruin of Law, who was no longer safe in France. His enemies clamored for his arrest, as the author of all the miseries of the people. The Regent promised it, and he was only saved by the Duc de Bourbon. At last, in December, 1720, the order was obtained that he should leave the country. Law now saw himself irrecoverably lost. But he maintained an inflexible demeanour to the last. On the 12th of December, he appeared at the opera, and he affected a complete security amid the cries of the people. But he had resigned all his offices. The next day, after having received the visits of a great number of the nobility, he retired to Guernande, his country seat, and awaited the decision of the Regent, taking with him of all his fortune, only 5 millions of notes, and 800 louis d'or. In a few days the Duc de Bourbon wrote that he was ordered by the Regent to send him his passports, and a sum of money. Law refused the money, and immediately set out for Belgium. The son of Argenson was intendant of Flanders, and with injudicious zeal, arrested him at Valenciennes, notwithstanding his passport. The government at Paris severely reprimanded the meddling official, and

he was ordered to be set free. The public were thus apprised of his departure. For a long time it was believed to be merely a stratagem, and that he had been secretly brought back, and retained about the Regent. When the people were at last convinced that he was really gone, they as usual, revenged themselves in an epigram:—

"Cy git oet Ecossois célèbre,
Ce calculateur sans égal,
Qui, par les règles de l'algèbre,
A mis la France à l'hôpital."

541. Thus ended the "SYSTEM." In the beginning of 1721, the Company, which according to the daring scheme of its author, was intended to combine finance, commerce, navigation, and banking, was stripped of its privileges. They only requested to be allowed to retain their tobacco trade. Henceforth they were nothing but an assembly of private merchants, till they once more had fortune placed in their grasp, and again missed it, and were finally dissolved.

542. The variations of the coinage of England have been bad enough, but they are as nothing, compared with those of the money of France. (COINAGE OF FRANCE). Law had argued with great force against the fraud and inutility of such proceedings, but when he was driven by necessity, and the danger to his own paper money, he broke through all his principles. M. Levasseur, who has published by far the most complete account of Law's system, gives in his *Recherches Historiques sur le système de Law*, Appendix H. p. 398, the following list of the alterations of the coinage from the 7th of May, 1719, to the 18th November, 1720.

THE GOLD COINAGE.

l. s.

1719.		
May 7.	The louis d'or, à la croix de Malte, called chevaliers, and coined in 1718, at the value of 86 livres (25 to the marc) were reduced to	85 0
July 2.	Altered to	84 0
Sept. 23.	"	83 0
Dec. 1.	Quinzains struck, 64 to the marc	15 0
Dec. 3.	The louis reduced to	82 0
Dec. 11.	
1720.		
Jan. 22.	The louis raised to	86 0
Jan. 28.	The louis reduced to	84 0
Feb. 7.		
Feb. 25.	The louis raised to	86 0
March 5.	The louis raised to	48 0
March 11.	The louis reduced to	42 0
	On April 1st to	36 0
	To be withdrawn on the 1st of May	
March 16th.	

THE SILVER COINAGE.

l. s. d.

Ecus called Navarres, coined in 1718, at 6 liv. (10 to the marc) were reduced to	5 16 0
Ecus	5 12 0
On the 1st Jan., 1720, to	5 8 0
On the 1st Feb., 1720, to	5 4 0
Pieces of 1 liv., (65½ to the marc)	1 0 0
Pieces of 1 liv., reduced to	0 18 0
On the 1st of February to	0 17 0
Ecus raised to	6 0 0
" reduced to	5 13 6
Twenty sous pieces reduced to	0 18 0
Ecus raised to	6 0 0
Twenty sous pieces to	1 0 0
Ecus raised to	8 0 0
Twenty sous pieces to	1 10 0
On the 1st of April, écus to be	7 0 0
1st of May	7 10 0
1st of June	6 0 0
1st of July	4 10 0
The 20 sous piece to be worth—	
In June	1 5 0
In July	1 2 6
In August	1 0 0
In September	0 17 6
In October	0 15 0
In November	0 12 6
In December	0 10 0
Tiers écus struck to be worth	8 0 0
In May	2 15 0
In June	2 10 0
In July	2 5 0
In August	2 0 0
In September	1 15 0

	1st December . . .	7 10 0
	1st January, 1721 . . .	6 0 0
The new écus to be . . .		7 10 0

Such were the tamperings with the coinage in the short space of nineteen months. We need only observe here, that they were the habitual practices of the French monarchs, and not introduced by Law.

543. On the 24th of January, 1721, a council was held to consider the means of liquidating the gigantic debts which were left on the dissolution of the bank. The members, as usual, bandied the most violent reproaches against each other. The Regent declared that Law had created 1,200 millions of paper more than he was authorized to do. A decree ordered the debts to be verified, and the management of the business was entrusted to Paris-Duverney and his brothers, who were recalled from exile on Law's banishment. It was vastly more difficult and complicated than the investigation of the debts at the death of Louis XIV.; and for several months 800 clerks were hard at work on the Herculean task. At length, at the end of August, 1721, the huge account was made up. The obligations of all sorts, including bank notes, amounted to 2,222,597,181 livres, besides 125,024 shares, which, at the last reduced legal value, were 250,048,000 livres, making a total of 2,452,645,181 livres, in claims, owned by 511,009 proprietors, whose titles were investigated. These were the remains of obligations and shares, which were at one time of the nominal value of twelve milliards, or about £480,000,000. But, in fact, not two-thirds of the creditors brought in their claims to be verified, as they remembered the severities of the former investigation.

544. Nor were they mistaken. No sooner were the claims ascertained than every means of fraud and violence were taken to reduce them. About 35,000 were called upon to prove the legality of their titles. The commissioners were ordered to call upon all notaries public to produce all the deeds connected with the negotiations of shares, and stock for the last two years. All persons, who had had share transactions within that time, were ordered to give in an inventory of all their property of all sorts, which they had acquired since the establishment of the Indian Company. A decree of the 23rd November, 1721, reduced the 125,024 shares, which had been brought in, to 50,000, and fixed the dividend at 100 livres. The claimants were divided into five classes, in the first were placed those paid by the

king; in the second those between private parties; in the third those sold for landed property; in the fourth those sold for moveable property, places, salaries, and gifts; in the last those whose origin was not declared. The first class were paid in full; the second were deprived of one-sixth of their claims, and the rest in increasing proportions, till the fifth, who lost nineteen-twentieths. The same reductions were applied to bank notes, and, to meet the reduced claims, the king applied 40 millions of the revenue from the 1st January, 1722. The commissioners met in December, and 1,500 clerks were employed under the famous Barême, to effect the liquidation. Numbers of the clerks were prize fighters in disguise, to quell any tumult. The company had already publicly destroyed about 50,000 shares, and, in the beginning of November, the remainder, estimated at 404 millions, were burnt, as well as 2,845,000 bank notes. By the end of June, 1722, the conversions were effected, and the obligations, by the violent and fraudulent means detailed, were reduced to 1,700,793,294 livres.

545. These measures only struck the then holders of obligations. It was determined to strike at those who had made immense fortunes by speculation, and had retired in time. They were called *Mississippiens*, and their luxury and insolence, amid the general misery and ruin, had excited the greatest indignation. Many were called upon to disgorge 20 or 30 millions, a bank clerk 50 millions, and Vincent le Blanc 80 millions, and then an extraordinary tax of 187,893,661 livres was laid upon them. One fortunate speculatrix alone was compelled to pay 8 millions. On the 17th October, 1722, the final scene of this extraordinary drama was enacted. An immense iron cage, ten paces long and eight broad, was constructed in the court of the bank. Everything connected with the final liquidation, notarial acts, contracts, registers, &c., were piled in it, and, in the presence of the public, the torch was applied, and all records of this stupendous catastrophe vanished in the blaze.

546. The company survived. Its shares were reduced to 56,000. The king owed it an income of 3 millions, on account of the 100 millions it had withdrawn in 1717. To secure these, the tobacco monopoly was restored to it, valued at 2,500,000 livres, and the revenues of Louisiana,

valued at 500,000. Each of these was in reality worth double what they were estimated. It regained the commerce of the East, and an Indian Council was erected to control it. Each share, besides the profits of trade, was guaranteed a dividend of 100 livres in 1722, and 150 livres afterwards. The monopoly of the sale of coffee was conferred upon it in August, and in February, 1724, the exclusive right to set up lotteries. It only remained to liquidate 1,512,899,348 of bank notes. To do this, life annuities at 4 per cent., and perpetual annuities at $2\frac{1}{2}$ per cent. were created; 31 millions of perpetual, and 16 millions of life annuities were formed on these terms.

547. M. Levasseur, (*Recherches Hist. sur le Système de Law*, p. 308-9), gives the following as the variations in the value of the bank notes and shares. On the 17th July, 1720, at the closing of the bank, the 10 livre notes only passed for 40 sous. In April, 1721, the 100 livre note passed for 6 livres 10 sous. The 1,000 livre notes were only worth 55 livres. After the *visa*, they lost about 80 per cent. even of that value. In February, 1721, the 100 livre notes passed for 4 livres of silver; in April, for 6 livres 10 sous; in May, for 8. In March, 1722, those not *visés* for 5 livres, and those *visés* for 7 livres; on the 28th, they rose to 14 livres; on the 17th April, to 19 livres; on the 18th they were at 16 livres; on the 21st at 24 livres 10 sous; and on the 22nd at 23 livres 10 sous. The shares after the *visa* varied from 1,000 to 900, 850, 800, and 730 livres; in September, 1721, they sold for 500 livres. In 1722, speculation began to revive in them, and the price rose to 1,500 livres. In August, 1723, the Duc d'Orléans was declared perpetual director of the company, but he died on the 2nd of December, and the shares immediately fell to 900 livres.

548. On the 15th of February, 1724, the Duc de Bourbon, who succeeded Orleans as prime minister, and who had made enormous sums by the company, conferred on it the right to establish lotteries. The shares again rose to 3,000 livres. In 1725, it recovered the monopoly of the Indian trade, the African, and that of Louisiana, and the sole right of selling slaves, tobacco, and coffee in all colonies established, or to be established. It was enabled to start afresh. All its previous debts were cancelled. It had thrown away a chance in Louisiana, which might have raised it to the highest power and wealth. Once more a future of surpassing brilliancy was opened to it. Under the name of the French East India Company, it founded Pondicherry, Chandernagore, and other settlements. The abilities and ambition of its servants, Labourdonnais, Lally Tolendal, and Dupleix, first founded a great European power in the east, and if it had not been for the genius of Cuvée, France, and not England, might have been at this moment the mistress of India. But it was not so to be. Every one knows the sequel of the contest in the plains of Hindostan. The Company overwhelmed with defeat, debts, and mismanagement, was finally dissolved in 1769.

549. Such is a plain historical narrative of the greatest financial catastrophe the world had then seen. We have in this place advisedly abstained from giving any account of Law's theory of money, upon which it was founded. That is

fully done in its proper place, (Law), and we purposely keep the narrative of the facts separated from an examination of the theory. At the present day, it is usual to class the Mississippi scheme along with the South Sea bubble, as the type of everything that is fraudulent, and Law himself is often thought to be nothing but a juggler, an imposter, and a charlatan. But this is a very hasty and erroneous judgment indeed. Even men who were opposed to his system, like St. Simon, bear witness to his integrity, and the sincerity of his belief in his own theory. No single man probably every raised a country in so short a time from the depth of misery to prosperity, as Law did France, from 1716 to 1718, by the institution of his bank. It was like the stroke of an enchanter's wand, and contemporary writers testify that the marvellous change was regarded with wonder and admiration throughout Europe. The foundation of the Mississippi company was no swindle, but an exceedingly well devised enterprise, which, if it had been properly managed, might have been as successful as any in the world. Law's own writings prove that he had as sound knowledge of banking as any man of his day, which is also proved by his administration of his own banking company, before it was converted into the Royal Bank, and mixed up with an erroneous theory. His great error lay in his conception of the nature of money and credit. In his general proposition that credit might be advantageously used to increase production, he was undoubtedly right. But his erroneous notions of the nature of credit were founded on an erroneous notion of the nature of money. But his notions of the nature of money were not peculiar to him, they were the current notions of the age, and they were held by many eminent writers long afterwards. For it was usually conceived that money is the *sign*, or *representative* of wealth, and this notion is fully adopted in the *Espit des Loix* (MONTESQUIEU). Now it is the invaluable service that Turgot did to the science of Political Economy, to shew that this conception of the nature of money is erroneous, that money is not the *representative* of value, but an independent article of value itself. It is the very first lesson in Political Economy to understand clearly the doctrine established by Turgot of the nature of money, and wherein it differs from the current doctrine of the age. (CURRENCY: MONEY: TURGOT.) But successful as Turgot was in explaining the true nature of money, he wholly failed in understanding the nature of credit. For he, and a host of writers after him, considered instruments of credit as *representative* values, as being the *signs* or *representatives* of goods, or money. Now this is the identical fallacy which he so successfully combated with respect to money. Law instinctively felt that money and credit are homogeneous, and his idea of credit was the necessary and logical consequence of his idea of money. Turgot wholly failed to see that his doctrine of the nature of money was equally applicable to that of credit. Instruments of credit are not the *signs* or *representatives* of value, but are independent articles of value themselves. Credit is property, and not the *representative* of property, as every man who is acquainted with the law of instruments of credit knows. (BYLES, JUSTICE). There

is no man who is at all conversant with the law of instruments of credit, who can fail to see that Adam Smith, Ricardo, and other English Economists have wholly misunderstood the nature of credit. The chances are infinite against any one who does not understand the law of the subject, forming a true conception of the matter. Under the article CREDIT, we have shewn the extraordinary self contradictions and incongruities, into which the most eminent writers are led from erroneous conceptions of its nature. We must content ourselves here with referring to the various articles in this Dictionary in which the subject is discussed. (BANK NOTE: BILL OF EXCHANGE: BYLES: CREDIT: PROMISSORY NOTE.)

550. Now Law's scheme was undoubtedly a *bonâ fide* attempt to carry out, not only his own theory of money, but that which was generally prevalent in his own age. The history and result of the experiment is peculiarly worthy of study, because the very same ideas are now very extensively prevalent, and are maintained by numerous writers. How many ingenious works are published now, in which credit is described as the *mobilisation* of property, or some such term as that, or are founded on the notion that instruments of credit *represent* property (CIESZKOWSKI; HILL, EDWIN.) and this false and fatal doctrine has led astray even able Economists, (BAUDELLART; GARNIER, JOSEPH.) Now this is the very doctrine which we call LAWISM, it is exactly the very essence of Law's theory, the very conception which is the basis of his "Système," whose history we have just narrated.

551. Nor is it just to attribute the awful result wholly to Law. Saint Simon expressly tells us that it was greatly due to the boundless extravagance of the Regent and the Court. Law was surrounded with a crew of rapacious and needy courtiers, and nobility, who believed that he had in his hands the power of creating boundless wealth. These persons were of such power that no man in his position could resist them. Thus, shares and notes were multiplied, and the future had to be drawn upon to support the credit of the present. Immense obligations were created which nothing but enormous profits could meet. And these profits had to be forced. Thence all the violent means used to force on the colony, and the jugglery to raise the value of the shares. Then, when the inevitable laws of nature, which had been so fearfully misunderstood, operated, the violent tamperings with the coinage; to which there had been no stronger opponent than Law himself. But from these extravagant issues of paper, Law found himself in a fatal vortex, from which no escape was possible, and thus enterprises, which in themselves were sagacious and beneficent, were brought to ruin, by a false theory destroying and overwhelming what was unquestionably sound. The real error of Law was not in mistaking the effects of credit, but in mistaking its *nature* and its *limits*.

552. Nor can we agree with M. Levasseur, who says that Law erroneously thought that the stock, &c., he created was real wealth, whereas it was only *imaginary* and *fictional* riches. The stock of a successful enterprise is undoubtedly part of the wealth of the country. Does any man doubt that the stock of the Bank of England, or of the London and

Westminster Bank, or of any other of the great banks, or East India Stock, is independent property, and part of the wealth of the country? And why not Mississippi stock, if it had been a successful enterprise? Even if the superstructure was too great, and ruined the whole, would not a moderate amount, justified by the reality, have been an addition to the wealth of the country? If an architect builds a tower too high for its base, and the whole comes tumbling down and is destroyed, that does not prove that a properly constructed tower, and one suitable to its basis, would be nothing. And this was Law's error, and the error of his theory, it wholly failed to show what were the true limits to which the operation might be carried. And this neglect ruined the whole, and destroyed institutions which might have been of incalculable benefit to the country.

553. The unfortunate result of the first experiment of a bank in France sickened the people of paper currency for many years, and no attempt was made to found another bank till 1776. On the 24th of March of that year, the king, on the report of Turgot, issued a decree in favour of Jean Baptiste Gabriel Bernard, to form a bank, which was called the *Caisse d'Escompte*. Its capital was to consist of 15,000,000 livres, of which five millions were to be kept by the company, and ten millions deposited in the Royal Treasury, as a loan, for which they were to receive receipts for 13 millions, payable in thirteen years, in half-yearly payments. The bank commenced business on the 1st of June, 1776, and they were allowed to issue bank notes, payable to bearer on demand, at discretion. By a decree of the 22nd September, 1776, the constitution of the company was modified. No loan was to be made to the king, the sum already advanced was repaid, and the capital was reduced to twelve millions, which the company might trade with. By another decree of the 7th of March, 1779, the shares were fixed at 4,000, and the funds of the company were only to be employed in discounting bills of exchange, and other negotiable instruments, at a fixed *échance*. Interest was to be four per cent. in time of peace, and 4½ in war. In 1783, there was a general monetary crisis in Europe, a great export of specie took place, the exchanges were greatly against the country, which, of course, the bank was unable to counteract, as it could not raise its discount above four per cent. A very severe pressure on the bank began, and on the 26th September its specie was reduced to 138,000 livres. On the next day a Royal decree appeared, authorizing the bank to suspend payments in cash until the January following. Its notes were declared to be legal tender, and all actions against it for payment of them stopped. Another decree of the 30th forbade the export of specie. On the 23rd November a decree made the acceptance of the notes in payment voluntary. At the same time the capital was increased to 15 millions, by the creation of 1,000 new shares, and the directors were ordered by the proprietors always to maintain a reserve in specie of from one-third to one-fourth of the notes in circulation, and not to discount anything but negotiable obligations, not exceeding ninety days, those whose *échance* did not exceed thirty days at four per cent., and those of longer date

at 44. On the 10th December another decree ordered the resumption of cash payments immediately, and restrained the notes which the bank might issue to ten millions.

554. On the 16th August, 1788, the government were obliged to adopt a partial suspension of payments, and an edict declared that all future payments should be made partly in exchange bills, or *billets du trésor royal*, with five per cent. interest, and partly in cash. On the 18th an edict was issued, permitting the Caisse d'escompte to suspend payments. They, however, of their own accord continued to cash their small notes, and a large amount of cash was paid away, so that a second edict in December, directed them to stop all payments in cash. Necker, being at his wife's end to raise money, applied to them for a loan of 15 millions on the security of exchange bills, to be redeemed in twelve months. Although this was contrary to the express orders of the shareholders, in 1788, they complied with it, as well as several other requisitions he made. In January, 1789, the directors lent Necker 25 millions from their own funds, and, on the 1st of April, they made him a further advance of notes to the amount of 10 millions. In September, 1789, they made another of 12 millions, also in notes. Of course these continual issues of inconvertible paper produced their usual effect. They fell to a discount of 5 per cent., and drew specie out of circulation. In September, 1789, Mirabeau severely attacked the conduct of the Finance Minister, and of the Caisse d'Escompte, in the National Assembly, and proposed that it should be compelled to resume payment. He severely stigmatised the suspension as a breach of public faith, and as illegal. But he did not succeed in his motion. On the 6th of November, he again brought the subject before the Assembly. He said (*Moniteur Universel*. Vol. II., p. 146. Edit. 1857) that specie had entirely disappeared from circulation, and that it had been exported in immense quantities, and that all commercial transactions were disorganized. That the exchanges had turned heavily against France, and that it was very profitable to export specie, that bills of exchange in Paris had fallen into utter discredit, and could not be negotiated on any foreign exchange. That this disorganization was entirely due to the edicts which had authorized the Caisse d'Escompte to suspend payments, and, at the same time, left it with an uncontrolled power of issue. The Caisse was daily augmenting the amount of paper money in the most alarming way. That it was running the very career that Law's Bank did. The notes were daily increasing, and daily falling in credit. On the frontiers 95 livres in specie were equal to 100 in paper, which naturally drew away specie from the capital. The merchants of the great commercial cities were in the utmost distress. At Marseilles there were scarcely ten houses which were not in the utmost straits. Matters at Bordeaux were no better. At Nantes, the merchants had been obliged to organize a system of private credit among themselves. Havre, Amiens, and Lyons, were equally distressed; they had not the means to pay for grain, which had been bought by a patriotic company. It was computed that 200 millions in specie had disappeared from circulation. He ended by pro-

posing that the Assembly should devise a scheme for a National Bank, to manage the finances, the public debt, and restore public credit.

555. On the 14th November, Necker said that an immediate loan of 170 millions was necessary for the State. He proposed that the Caisse should be erected into a National Bank, with exclusive privileges for 10, 20, or 30 years, with a Directorate partly elected by the Shareholders and partly by the State. That it should create 240 millions of notes to be lent to the State, and to be redeemable in 1791, and 40 millions for the purpose of discounting commercial bills. This plan, however, was warmly opposed by Mirabeau and others, and rejected. It appeared that it had at that time advanced 85 millions to Government, and besides, had upwards of 114 millions of notes in circulation. So much for the resolution of the Shareholders which had ordered its issues to be confined to 10 millions!

556. This course once begun could not be stopped. On the 1st January, 1790, its advances to government had increased to 160 millions, and were to be still further increased to 240 millions by the 1st of July, at which date, however, the government had undertaken to liquidate its entire debt. In February, its advances to private parties had increased to 144 millions. The notes were falling daily to a heavier discount, when it became necessary to adopt another plan, and the Assignats were devised, and it is remarkable that Mirabeau, who was such a strong opponent of the suspension by the Caisse, and of its inconvertible notes, was one of the principal supporters of the Assignats. As these could not be prepared as soon as was expected, the notes of the Caisse were ordered to be received instead of them, and to be converted into them when they were ready. On the 29th of May, the notes had fallen to a discount of 10 per cent. On the 1st July, the King published a proclamation, calling upon all persons to exchange their notes for Assignats, and finally releasing the Caisse from any future redemption of its notes in specie.

557. The Caisse was thus manifestly struck with a fatal blow, but it continued to carry on its operations some time longer. But the existence of such an anomalous institution, issuing inconvertible paper at will, could not manifestly long subsist, and, on the 25th August, 1792, a proposal was brought forward in the Legislative Assembly to suppress it. The Caisse offered to redeem 900 millions of assignats in specie, probably with a view of staving off its own suppression, and the assembly accepted this act of patriotism. Within a month the assembly itself came to an end. The National Convention which followed took no heed of its services, and on the 24th of August, 1793, a decree was passed, abolishing the caisse d'escompte, all life assurance companies, and, in fact, all joint-stock companies whatever, whose capital was formed of transferable shares, and prohibiting all such companies for the future, without the special authority of the legislature. Commissioners were appointed to seal up all its repositories, and its notes were all ordered to be converted into assignats.

558. In 1796, the whole system of Assignats was destroyed; and a metallic currency immediately re-appeared. The *caisse d'escompte*

had perished, but the necessity of a public bank was felt so strongly, that the bankers of Paris soon organized one, which was called the *Caisse des Comptes Courants*. At the time this bank was founded, the rate of interest was three per cent. per month. It issued notes payable to bearer on demand, and the rate of interest was soon reduced to six per cent. In 1798, a second bank, called the *Caisse d'escompte de Commerce*, was formed, and also issued notes. In the beginning of that year one of its officials robbed the *Caisse des Comptes Courants* of 2,500,000 francs. The directors, in alarm, gave notice of a suspension of payments, but some of the more strong-headed shareholders, and some of the directors, showed that it was still solvent, and that the *Solidarité*, or joint and several liability of its shareholders secured the public from any loss. The bank opened its doors next day, and the declaration of liability of its shareholders reassured the public, and its notes suffered no depreciation, and in a year it had regained more than a quarter of the loss. In the following year, one of the directors of the *Caisse d'escompte de Commerce* robbed it of 100,000 francs, but it had abundant means to cover the loss. The Bank of France assisted it, and it suffered no diminution of public confidence. One or two other banks were also formed, which issued notes,—and this, too, in a period of great public unsettlement.

559. After the events of the 18th Brumaire, the first Consul determined to form a State Bank. A considerable amount of rivalry had existed among the different companies, who tried to injure each other. Napoleon determined to suppress this, and only to allow a single bank. This was created by a decree of the 18th of January, 1800, and it began operations on the 20th of February. Its formation was very slow; there were 30,000 shares of 1,000 francs each, authorized to be created, but during the first year only 7,447 were taken. All public monies were paid into it. The other companies only discounted bills at an échéance of forty-five days; the Bank of France extended it to sixty days. In the first year, it discounted to the extent of 89 millions, and in the next one to 182 millions. In 1803, the intention of Napoleon to suppress all other banks was carried out. On the 14th April, a monopoly of issuing notes was conferred on the Bank of France, all other associations were forbidden to issue new ones, and obliged to withdraw those that were out. No bank might be formed in the departments without leave of the government. The bank's privilege was given for 15 years, its capital was raised to 45 millions, and its dividend limited to six per cent. All profits above that were ordered to be invested in government securities, as a reserve fund. It gave five per cent. on deposits till 1804, and four per cent. after that.

560. The bank had been instituted to facilitate the operations of government. One of these consisted in issuing its notes against public securities. The receivers of the taxes were in the habit of giving their promissory notes, in anticipation of the revenue. It was the custom of the bank to discount these at six per cent., when private parties would only do it at ten or twelve per cent. In 1804 it had discounted from twenty-five to thirty millions of these securities direct

to the government itself. Thinking this was as much as prudence warranted, they refused advances to several government contractors, whose paper was also of the same description. Napoleon, with that insatiable love of despotism, which thinks that the laws of nature must be subject to its will, and wholly unable to understand that the bounds of credit are limited, and cannot be forced, was very angry with the bank, and addressed the most earnest remonstrances to it. The bad effects of the issues were already felt, there was a constant drain of 200 or 300 thousand francs a-day from the capital to the provinces, and the bank made strenuous efforts to bring specie back again. At the end of 1804, the reserve of the bank amounted to 255 millions of stock, but the uncovered advances to the treasury were continually increasing. The situation inspired the directors with daily increasing alarm. They thought of selling their public securities, but the price was so low, that it would have affected their credit. Loans were raised upon them, and foreign credits were opened. But they could not diminish their advances to commerce, and their notes were constantly increasing from the discount of the obligations coming in from abroad. The loans had been raised for two months, and at the expiry of that term, the lenders refused to renew, and demanded payment, under threat of selling the securities. They were thus in the utmost straits, and determined to contract their commercial discounts. They refused to make any advances to commerce. This brought on an immediate commercial crisis. At the same time the report was spread that the Emperor had carried off the reserve of cash with him to Germany. This brought on an immediate run upon it, and in the beginning of 1806 it was obliged to stop payment. At this time it had ninety-seven millions of paper under discount, of which eighty millions were government securities. It limited the payment of its notes to 500,000 francs a-day. They were in a short time reduced to 48,334,000, and its metallic reserve fell to 1,136,000. The notes fell to a discount of ten per cent.

561. These were the very same causes that had brought on the stoppage of the Bank of England previously in 1797, namely an extravagant demand for issues on government securities, and then in the midst of this, a sudden and violent contraction of mercantile discounts. The report of the Directors said that the usual demands for specie were 500,000, and in the height of the panic they amounted to 1½ millions. M. Courcelle-Seneuil, says that the sudden contraction of commercial discounts was a deplorable measure, which precipitated the crisis, and added real to imaginary dangers. Napoleon was much annoyed at this crisis. By a law of the 22nd April, 1806, the capital of the bank was doubled, its administration was brought more under the control of the government, and its privileges were extended to 1831. Two-thirds of the profits were allowed to be divided. The suspension lasted four months. By new statutes of the 16th January, and the 18th May, 1808, it was permitted to establish branches in the departments. On the 10th January, 1809, one was opened at Lyons, and one at Rouen, and on the 29th May, 1810, one at Lille, but the rules of business were

so strict, that they had no success, and were abandoned, and the capital of the bank was reduced to 67,900,000 francs.

562. In 1812, the empire began to give signs of tottering. People were afraid to undertake any enterprise, and discount fell to two per cent. The bank had then in reserve 114 millions of specie, and notes in circulation to the amount of 117 millions, and only 15 millions of paper under discount, which actually fell to 10 millions. In 1813, the cash fell to 26 millions, and the notes to 85 millions. In January, 1814, a run of $4\frac{1}{2}$ millions of specie took place, its specie fell to 5 millions, and its notes to 10 millions, and its deposits on current accounts to 1,300,000. In 1815 it of course stopped payment. In 1818 there was another crisis, which we have also seen affected the Bank of England, and compelled its third suspension of cash payments in 1819. The cash in July, was 117 millions, in October it fell to 59 millions, and in November to 34. The *échéance* of bills was reduced to 45 days.

563. About this time somewhat more freedom was allowed to banking in the departments. Banks were opened at Rouen, on the 17th May, 1817; at Nantes on the 11th March, 1818; at Bordeaux on the 23rd November, 1818. A long interval elapsed before any others were formed. One was founded at Lyons on the 19th June, 1835; at Marseilles on the 29th June, 1835; at Lille on the 29th June, 1836; at La Havre on the 25th August, 1837; and at Toulouse on the 11th June, 1838. The Bank of France seeing the success of the departmental banks, opened branches, at Rheims on the 6th of May, 1836; at Saint Etienne the 17th June, 1836; at Saint Quentin on the 16th October, 1837; at Montpellier the 19th January, 1838; at Grenoble on the 31st March, 1840, and at Angoulême the 24th April, 1840. In that year the charter of the Bank of France was continued till 1867, with power reserved to revise it in 1865, and after this no departmental banks were allowed to be formed. The Bank of France established new branches at Besançon, Caen, Châteauroux, and Clermont-Ferrand, in 1841; at Mulhouse in 1843; and at Mans, Nîmes, Strasburg, and Valenciennes in 1846.

564. The operations of the Bank in 1846 were unusually extended, and, like the Bank of England, it suffered a great drain of bullion, which fell in six months from 252 millions to 80 millions. For twenty-seven years the rate of discount had been four per cent., in the beginning of January, 1847, it was raised to five per cent., which lasted till January, 1848, when it had 189 millions of specie, and the rate was reduced. At the end of 1846, the directors were obliged to obtain specie abroad, and they borrowed one million from English capitalists, at five per cent. on the security of stock. In March, 1847, the Bank was greatly assisted by an offer from the Russian government to purchase annuities, to the amount of 50 millions of francs. As vast sums were due to Russia for the purchase of grain, which must have been paid in specie, as soon as the navigation was open, the offer was gladly accepted by the Bank. This greatly helped to reduce the pressure on the Bank, and it neither reduced the *échéance* of the bills, nor curtailed its accommodation to commerce. The

only means used to meet the drain was to raise the rate of discount, and by the end of the year, the specie had risen to 181 millions, and was still flowing in. When the revolution broke out in February, 1848, it had 226 millions of specie. No institutions of credit could expect to survive such a convulsion. Nevertheless for a long time the Bank faced it bravely, and did everything it could to support commerce. In fifteen days from the 26th of February, to the 16th of March, it discounted 110 millions. Of 125 millions it owed to the treasury, it paid 77, besides 11 more placed at the credit of the government in the departments. It also discounted 43 millions at its fourteen branches, and lent great assistance to the departmental banks, to save them from stopping. The cash in Paris fell to 70 millions. On the 15th of March, it paid away 10 millions, and then had only 59 millions left. It was evident that the Bank could not go on paying specie more than a few days longer. That the Bank should stop and wind up its business, was not to be thought of. On the evening of the 15th, a decree of the government declared its notes legal tender, and authorised it to suspend payments, till further orders. Its notes were limited to 350 millions. It was ordered to publish a statement of its affairs every week in the *Moniteur*, and it was authorized to issue 100 franc notes, and the departmental banks were amalgamated with the Bank of France. Their stock was taken at par, and the Bank allowed to increase its issues by 102 millions. The Bank relieved from the necessity of paying their notes, bought 40 millions of specie at a considerable sacrifice. It made large advances of specie to aid the government, in March 30 millions; in May 30 millions, in June 150 millions, in instalments. It also assisted the cities of Paris and Marseilles with large loans, and many other establishments founded to support credit, and advanced to a considerable amount on merchandize and warrants, which it was not authorized by its statutes to do. The advances in Paris and the departments amounted to 60 millions. It made advances on all sorts of other property to support industry. It treated its debtors with the utmost leniency, and only adopted extreme measures against those who tried to deceive it. By these means a vast amount of commerce was sustained, which must otherwise have fallen. But the uncertain state of the country told with immense effects on trade. The discounts at the bank, which had been 100 to 150 millions from January to March, fell to 20 millions in December. On the 16th of March the sum under discount at the bank and its branches was 305 millions; on the 28th December the sum at the bank and its branches, including all the departmental banks, was 165 millions; and of this the sum at the Bank of France itself was only 42 millions.

565. In 1849, matters became still worse. In 1847, the total of operations had been 2,714 millions; in 1848, it was 1,874 millions; and in 1849, 1,328 millions; and the sum under discount at the Central Bank fell to 23 millions. On the 22nd December, 1849, the bank was authorized to increase its notes to 525 millions. Although it had been authorized to suspend payments, it had never done so in fact, and after some time, when matters got more settled, it had practically

resumed payment. As soon as this was done, people got tired of carrying their silver money about, and demanded notes for it, but the bank's issues were already at their full legal extent, and could not be increased, which created much public dissatisfaction. To meet this case its power of issue was increased by 73 millions. In 1850 a very slight improvement took place. The sum total of operations increased by 142 millions. In 1849 the greatest sum under discount at any one time was 47 millions, and in 1850, it was 44 millions. The maximum of 1847 was 231 millions. The minimum of 1847 had been 152 millions; in 1850 it was 23 millions. In 1851 the progress of the recovery was very slow. But in 1852, when order seemed to be restored to the state, it was extremely rapid, and the operations of that year fell but comparatively little short of those of 1847. Interest was reduced to three per cent.—the lowest it had ever been. In this year its privileges were extended to 1867. During the two following years its prosperity continued rapidly to increase. Soon after the middle of 1855 a very severe drain of bullion set in, caused, probably, by the war in the Crimea, and the deficiency of the harvest. To meet this, the bank was obliged to import, at a great expense, from 200 to 300 millions of specie, and to impose restrictions on discounts. This was caused by the absurd restraint on the rate of discount, which was limited to six per cent., when the market rate was considerably higher. In 1856, the same general stringency of money matters continued, and restrictions were imposed on the échéance of bills; on the 5th of October they were reduced from 90 days to 60, and on the 24th December extended to 78. Purchases of bullion at a heavy loss continued to be made in consequence of the absurd law fixing the rate of interest. In consequence of this absurdity, during 18 months from July, 1855, to December, 1856, the bank bought 814,300,000 francs of specie, at a loss of 11,215,000. At last this folly was repealed, and on the 27th of February, 1857, the restriction was taken off, and the rate of discount left free. The necessity and the advantage of this was soon seen in the great crisis of November, 1857, when discounts rose from 5½ in June to 8, 9, and 10 per cent. in November, according as the échéance of the bills was 30, 60, or 90 days. After the 27th of Nov. these rates were reduced one per cent., and after the 18th of December, the rates were reduced to a uniform amount of six per cent., and on the 29th to five per cent. Heavy purchases of bullion were also made in this year, but at a less expense than in the preceding one. In 1857, the privileges of the bank were extended to 1897, and its capital was raised to 182,500 shares of 1,000 francs. Of this sum, 100 millions of francs were to be advanced to the government in the course of 1859, and to be applied in payment of the uncovered balance of the Treasury. All sums charged above six per cent. for advances were to be added to the capital. It was allowed to issue 50 franc notes. In 1867 the Government is to be allowed to direct the bank to erect branches in those departments where none exist.

566. The Bank of France was prohibited by its statutes from discounting bills with less than three solvent names, and founded upon real transactions. In 1808, it was allowed to dispense

with one name, on the deposit of its own stock, or government security to the amount of the bill. In 1848, a deposit of merchandize of the value of the bill was allowed as well. In 1857, shares, and railway debentures, and obligations of the city of Paris, were allowed. It takes no obligations beyond three months. It also transacts all the other usual descriptions of banking business.

Historical Notices of the Rise of Banking in various Countries.

AT ROME.

567. The business which is technically called BANKING seems, as far as we can ascertain, to have been invented by the Romans. It is true that there were abundance of money dealers and money lenders at Athens, and other places, but their business seems, as far as we can discover, to have been more analogous to that of those persons we call *money scribblers*, and *bill discounters*, than of those whom we call bankers. For we have seen that the business of banking technically consists in creating credits in favor of the persons who deposit money with the banker, and in paying debts by transferring sums from one account to another, as well as by making all advances in the first instance by creating a credit. This mode of doing business essentially distinguishes a banker from a *money scrivener*, or *bill discounter*, who actually advances the money itself. This seems to have been the business of the Athenian *ραπίζτραι*, and, if so, they were technically bill discounters, and not bankers.

568. The Romans, on the contrary, practised the business, which is technically called banking, exactly as we do, nor do we know when it was invented. The earliest notice we have of these banks, or *argentaria*, is in Livy IX., 40., B.C. 308, where they are spoken of as being already placed in the forum, where they always continued. But he gives no account of the method in which the bankers transacted their business. The comedies of Plautus are full of allusions to bankers and their business. He calls them *trapezite*, *argentarii*, and *danista*. We have Latin words corresponding to the method of keeping banking books. Thus, *scribere* was to give credit in the books, *rescribere*, or *perscribere*, was to transfer a sum from one account to another by means of a cheque, which was called *perscriptio*, or *attributio*. Thus, in the *Asinaria* II., 4, 34, Leonida says,—

"Abduci domum ultro, et scribit numos."

"Of his own accord he brings him home, and places the money to his account." So *acceptum ferre* was to credit a customer's account with money received, *expensum ferre* to debit it for money paid. Thus, in the *Mostellaria* I., 3, 146,—

"Ratio accepti et expensi inter nos convenit."

"The accounts between us balance." Plautus

only uses the word *mensa* to mean a bank, in two places. *Curculio* iv., 3, 4,—

"Velut decem minas dum hic solvit omnis *mensas* transit."

"As before this fellow paid me the ten minae, he had to go to every banker's;" and in the *Pseudolus* i., 3, 62,—

"Postquam isti a *mensa* surgunt."

"After these bankers broke." But he never uses *mensarius* for a banker. These persons are mentioned numberless times in his plays. So, also in Terence. *Phormio* v., 7, 29,—

"Sed transi, sodes, ad forum, atque illud mihi Argentum rursum jube rescribi, *Phormio*."

PHORM. Quodne ego perscripsi porro illis, quibus debui?"

"But, *Phormio*, be good enough to go over to the forum, and order that money to be put to my account."

PHORM. What! that for which I have already given cheques to my creditors?"

So Cicero, (*Epist. ad Atticum* xvi. 2) "qui de cccc. Hs cc presentia solverimus, reliqua rescribamus." "Of the remaining four hundred sestertia, I have paid two hundred in cash, and I shall send a cheque for the rest." So *Orat. pro Caecina* vi. "Se autem habere argentarii tabulas, in quibus sibi expensa pecunia lata est, acceptaque relata." "But he himself has the banker's books, in which are the accounts of the money paid and received."

569. Although we have seen above that Plautus uses *mensa* as the counting house of a private banker, they were never called *mensarii*. The latter were public officers of high rank, who were appointed by the State only in times of great public distress, when the plebeians were weighed down with the accumulation of compound interest, to effect a compromise between debtors and creditors, and to advance money from the treasury to citizens in distress, on the security of goods, or land, or cattle. The first appointment was made 348 B. C. (*Livy* vii. 21.) They were then five in number. On other occasions (*Livy* xxiii. 21; xxvi. 36) they were only three in number. They seem to have been instituted for very much the same purpose as the *monti di pietà*, in the middle ages in Italy, and which are still very common on the continent under the name of *monts-de-piété*. (*MONTI DI PIETÀ*.)

IN CHINA.

570. We have seen that the Romans first invented the business of "banking," namely, making instruments of credit perform the duties of money. But they did not invent bank notes. The invention of bank notes is due to the Chinese. In the beginning of the reign of Hian-tsoung, of the dynasty of Tang, about the year 807, A.D., there was a great scarcity in the country. The Emperor ordered all the merchants and rich persons to bring all their money into the public treasury, and in exchange for it gave them notes called *fei-tshian*, or flying money. In three years, however, this money was suppressed in the capital, and was only current in the provinces. In 960, A.D., Thai-tsu, the founder of the Soung dynasty, revived this practice. Merchants were allowed to deposit their cash in the public treasuries, and received in return notes called *pian-*

tshian, or current money. The convenience of this was so great that the custom quickly spread, and in 997 there was paper in circulation to the amount of 1,700,000 ounces of silver, and in 1021 it had increased to 2,830,000 ounces. At this period a company of the sixteen richest merchants were permitted to issue notes payable in three years. But at the end of that term the company was bankrupt, which gave rise to much public distress and litigation. The Emperor abolished the notes of this company, and forbade any other joint stock banks to be formed. Henceforth the power of issuing notes was kept in the hands of the government. These notes were called *kiao-tsu*, and were of the value of an ounce of silver. In 1032 there were *kiao-tsu* to the value of 1,256,840 ounces in circulation. Subsequently banks of this nature were set up in each province, and the notes issued by one provincial bank had no currency in any other. These were the first bank notes on record,—that is to say, notes issued in exchange for money, or convertible into money, and not paper money, or paper created without any previous deposit of specie. Besides these bank notes the Chinese manufactured paper money to a large extent. (*CURRENCY, PAPER.*)

Journal Asiatique. Vol I., p. 256. By Klapproth. 1822.

Popular error concerning the dates of the Bank of Venice, and the Bank of St. George, at Genoa.

571. A crowd of writers, including among them many of the greatest names in literature, have assigned the date of 1171, or even 1153, to the Bank of Venice, and that of 1407, to the Bank of St. George, at Genoa. But we shall show that these dates are both extremely erroneous. The *Bank* of Venice dates only from 1587, and the *Bank* of St. George only from 1675. To say that they were founded in the years 1171 and 1407 respectively, is exactly as erroneous as it would be to say that the Dukedom of Wellington was created in the year 1769, because the illustrious person on whom that title was conferred was born in that year. No doubt the bodies of persons, or corporations who managed these banks, were formed in the years 1173 and 1407, but the *Banks* were only founded in the years we have mentioned, namely, that of Venice in 1587, and that of Genoa in 1675.

Historical sketch of the Rise and Progress of Banking in Italy.

572. Money dealers established themselves in Italy at a very early period of the middle ages, both as money changers, and money lenders. But neither of these constitute banking. As far as we can ascertain, the business of *banking*, or dealing in credit, was revived at Florence in the early part of the 12th century. It was intimately connected with the invention of Bills of Exchange, (*BILL OF EXCHANGE*), which was practised by the Lombards, especially those of Asti, and the people of Cahors, in the department of the Lot, in France, very early in the 13th, if not in the 12th century. The business of *bankers*, however, chiefly flourished at Florence, and was one of the principal causes of raising it to so great a pitch of commercial eminence. The names of the

Bardi, Acciajuoli, Peruzzi, Pitti, and Medici, were famous throughout Europe. In 1345 the Bardi, and the Peruzzi, the two greatest mercantile houses in Italy, failed. Edward III owed the Bardi 900,000 gold florins, which his war with France prevented him paying, and the King of Sicily owed them 100,000 gold florins. The deposits of citizens and strangers with the Bardi were 550,000 gold florins. The Peruzzi were owed 600,000 gold florins by Edward III, and 100,000 by the King of Sicily, and the deposits they owed their customers were 350,000 gold florins. The fall of these two great pillars of credit involved that of multitudes of other smaller establishments, and, says Villani, (Istor: Fiorent: xii. 55) the community of Florence had never been thrown into such ruin and disorder before, and thereupon he breaks out against the folly of his fellow citizens entrusting their money to the care of others, for the love of gain. The city however recovered from this terrible disaster, and we find that between 1430 and 1433, 76 bankers at Florence lent the state 4,865,000 gold florins. At one time Florence is said to have had 80 bankers, but not any public bank.

573. In the 16th century, there were 40 great bankers at Naples. They were obliged to deposit 40,000 ducats with the government, as security, and they were bound not to go beyond the limits of the kingdom. But these precautions were in vain. They frequently failed, causing of course great distress, and, in 1575 the government determined to institute a public bank. This was the earliest public bank in Italy, being 12 years before that of Venice, and exactly 100 years before that of Genoa, both of which are erroneously placed before it. This was called the *Banco di A. G. P. et di Pietà*. Several other joint stock public banks were founded shortly afterwards, viz., the *Banco del Popolo*, in 1589; the *Banco dello Santo Spirito*, in 1591; the *Banco di S. Eligio*, in 1596; the *Banco di S. Giacomo*, in 1597; the *Banco delle Povere*, in 1600; and the *Banco de' SS. Salvatore*, in 1640. Private bankers were not abolished, but they could not stand the competition of the public banks, and ceased to exist after 1604. Whether any of these banks survived the Revolution we are not aware.

De' Banchi di Napoli, e della lor ragione. By Michele Rocco. Naples, 1785.

Sul credito, le banche, e le casse di risparmio. By Carpi.

AT VENICE.

574. It is one of the great current delusions of historians and economists, that the Bank of Venice was founded in 1171. But, in the technical sense of *banking*, this is a complete error. We have seen above that the Bank of Venice was not even the first public bank in Italy. The fact is that, in the year 1171, the Venetian republic was oppressed with great financial disorder, in consequence of wars carried on simultaneously with the empires of the east and the west. In order to extricate herself from these financial difficulties, the State levied a forced loan from its citizens, and promised them interest at the rate of 4 per cent. The stock was made transferable, and a body of commissioners was erected in 1173, to manage the transfer of the stock, and the payment of the interest. These

commissioners were called the *Camera degli Imprestiti*. Such a loan has several names in Italian, such as *compera*, *mutuo*, but the most common is *monte*, a joint stock fund. This loan, in 1173, was called the *monte vecchio*, and, in course of time, several others were contracted, and two especially were called the *monte novo*, and the *monte novissimo*. Now we have shewn in the beginning of this article that the English word *bank* is the equivalent of *monte*, and under BENBRIGGE, that this author repeatedly translates the word *mons* by *bank*, and especially calls these *monti* at Venice, by the name of the three "*bankes of Venice*." It is thus the confusion has arisen. The word "*bank*" is the translation of *monte*, but it has no relation whatever to the business of *banking*. These banks at Venice were nothing but commissioners of public debts. The very same error, as we have shewn below, prevails with regard to the Bank of St. George, at Genoa.

575. The first "*bankers*" at Venice were two Jews, who obtained leave from the Senate, in 1400, to set up banking, and this business was afterwards taken up by many of the nobility, but towards the middle of the latter half of the 16th century, many of them failed, and caused great public distress. Moreover the coinage was in a great state of confusion, from the number of clipped, and worn foreign coins in circulation, which disorganized all dealings in credit. In consequence of some political changes which took place in the constitution, the Senate prohibited the nobility from engaging in commerce, and organized the Bank of Venice in 1587.

576. Dr. Lewis, writing in 1678, says (*A large Model of a Bank*, p. 40), "As to the bank at Venice, it is not of any very long standing—it had its first rise from the dishonesty of the bankers. The bankers at Venice did just as our bankers have done here,—they got men's money into their hands at interest, and used it (as was necessary) to their best advantage; that they might make a better profit of their money, than the interest they paid, they lent it out to insolvent persons, or laid it out in desperate cases, as our bankers did. Hence, when they were disappointed, they did unavoidably break, the creditor lost his money, the common-wealth their trade: for the banker got what he could, and fled out of their territories, as ours do into the *King's Bench*."

"The States, finding such an intolerable inconvenience, as we now do, if men lent out their money, many times they lose it; if it lay dead by them, trade dwindles away by this stagnation, just in such a time as this is, the States set up their bank, and their officers became cashiers (as at Amsterdam,) for about two millions of ducats, a bank sufficient for their trade, which was kept in specie to be taken in, or paid out, as the merchants desired it, until the necessity of their affairs in the late Turkish wars, forced them to expend all the money in specie, which was lodged in the bank; now there is no money at all, neither is any money in specie ever paid out; but their bank is a perfect credit bank, and the fund is a mere imaginary thing; yet, because the fund being, as I said, four millions of ducats, which Venice is able to raise, and the states have obliged to pay, (though they are never like to pay a farthing of it to the end of the world) all

men accept this credit as money, nay, since it hath been in this condition, the very credit hath been 20 per cent. more than cash in specie; all merchants trading thither can tell you credit in the bank is much better than cash in the chest; the reason is what I have first mentioned. Credit in bank is more safe, more portable, and more transferable than money in specie, and so of greater value, as gold is better than silver.

"Not many years since credit in Bank at Venice, (as our merchants can remember) was better than cash in specie, by more than twenty in the hundred, which the states found inconvenient for their trade: the States could not by any law suppress this excessive exchange, though they made it capital to take 20 per cent., till at last they were advised by a sagacious merchant to bring money in specie into the bank to answer their credit, this presently brought down the exchange: hence some merchants here thought the credit of the bank was impaired, because the exchange fell, when it was quite contrary, the bank paid money in specie instead of writing off credit from one to another, this made the exchange less." This passage is repeated with a few verbal alterations, in a pamphlet called *England's glory by a Royal Bank*, published in 1694.

577. This organisation of the BANK of Venice took place in 1587. The merchants were invited to deposit their money in an office managed by the Commissioners of the Public Debts. They received a credit in the bank's books equal to the actual weight of the bullion deposited, for which they could always demand an equal quantity of bullion at any time, or transfer it to any one else. Thus a uniform standard of payment was insured. It was enacted that all bills on Venice should be paid in bank money. By this means the bank money bore always a premium, compared with the current money, of about 9 per cent., called an *agio*. This bank did no business on its own account, and as it professed always to keep the bullion in its vaults, it is clear that the credit it created was exactly equal to the bullion displaced. This is an example of what is called the "currency principle."

578. Although the bank transacted no commercial business of its own, the temptation of using the money deposited in its vaults was too strong to be resisted, and on certainly two, if not three occasions, it suspended payments. Besides the suspension alluded to in Dr. Lewis's tract above quoted, in 1678, it suspended payment again in 1691, and again from 1717 to 1739, when the State applied the money in its vaults to the purposes of war. Mr. Cantillon also says that on one occasion it tried to raise a loan by creating credits in the Bank's books, but this was done to such an extent that the credits fell to a discount of 20 per cent., as compared with specie. To remedy this, the State was obliged to mortgage a part of its revenue to raise a fund of real current specie, to purchase these transfer credits, which had the desired effect of bringing the credits to par. The author does not give the date of this transaction. (*Analysis of Trade, &c.*, 1759, p. 185). The Bank was destroyed by the French in 1797, the same year with that of Genoa.

THE BANK OF ST. GEORGE, AT GENOA.

579. The origin of public debts at Genoa is even earlier than those of Venice. In 1148, the Ligurian Republic conquered Almeria and Tortosa, in Spain, and found themselves greatly encumbered with debt. Public loans were created by means of terminable annuities, which were secured on the taxes and customs duties. In process of time these loans, or *mutui*, greatly increased, and, in the 14th century, it was thought that something must be done to reduce them to greater order. In 1346, it was proposed to consolidate them, but the plan was not carried out then. Towards the end of the century the republic was torn with internal dissensions, and in 1396, Antoniotto Adorno, then doge for the fourth time, thought it would be advisable to apply to a foreign power for protection. Application was accordingly made to Charles VI., of France, who sent Jean Le Maingre, Marshal of France, as Governor. At this time there were a great number of different offices for the management of these loans, which were also called *compere*, and for the management of the revenue, called by a variety of different names. The names of the public creditors were entered in a book called *cartulario*, the credit was called *colonna*, and the creditor, *colonnante*. The debts were divided into shares of 100 lire each, and made transferable at will. At length, in 1407, these loans fell into great disorder from the political disturbances. The Governor called a council of the Ancients, together with the *Uffizj di Provisiione e della Moneta*. By their advice, eight of the most highly esteemed citizens were appointed a committee to devise a plan to extricate the republic from its difficulties. All the public debts were consolidated, and all the public offices were formed into one company, which took the name of the *Ufficio di San Giorgio*. The old loans at 7 and 8 per cent. were paid off, and a new single stock at 6 per cent. was created. The company gradually acquired great privileges and power, they were entrusted with the collection of the revenue, and were endowed with civil and criminal powers in all matters relating to the taxes.

580. In 1453, Pietro Fregoso was doge. The republic was distracted with internal dissensions, and the expense of the war with Mahomet II., who was besieging Constantinople, and the Genoese settlement of Pera. The government ceded to the Company of St. Giorgio Pera, and its other colonies in the Black Sea, in full property. In the same year it was unable to maintain its authority over Corsica, and it also ceded it to the Company, with full power to equip all forces necessary to preserve these possessions. The Company was so embarrassed by the expenses of these acquisitions, that it was unable to pay any dividend on its shares in 1456, and it obtained the Pope's leave to suspend their payment for three years. In 1479, it was further released from paying any stated dividend in future, and allowed to divide whatever profits there might be for the year. In the same year a distinguished citizen, named Lodovico Fregoso, took Sarzana by stratagem from the Florentines, and the state being too weak to defend it, ceded it to the Company. In a short time it also ob-

tained Serravalle, Castelnovo, Ortonovo, and S. Stefano. In 1512, Pieve del Pieco, with the territory attached to it, was also given over to it. In 1514, it acquired Ventimiglia and its territory, and in 1515, Levanto and its territory. "In short," says Machiavelli, (*Istorie Fiorentine*, lib. VIII.) "the Company being always wealthy and well managed, was able to make constant advances to the city, which was always in difficulties. The city first conceded the customs to the company, as security for the loans, then she assigned towns, castles, and territories, so that the company had at that time, under its administration, the greater part of the lands and cities of the Genoese dominions. Every year it sent its deputies, selected by vote, without the interference of the state. And the citizens greatly preferred the rule of the company to that of the state, on account of the tyranny of the latter, and the excellent regulations of the former. The company did not interfere in the political contests itself, but it was powerful enough to compel the successful party to respect its laws. Thus this company exhibited an extraordinary spectacle, which no philosopher had ever imagined, namely, within the same state, and among the same citizens, there was liberty and tyranny, justice and licence, and order and disorder, for the company alone maintained in the city many ancient and venerable customs,—and if it should happen, as was extremely probable, that the company should obtain possession of the whole city, Machiavelli expected that Genoa would become even more illustrious than Venice. Notwithstanding this, the company found that the administration of these territories was ruining its finances, and in 1562 it restored them to the state. In 1539, the debts which had been redeemable were changed into perpetual annuities, the operation was called *magno contratto di consolidazione*, and the company was put in full possession of 76 kinds of taxes, and customs duties.

581. All this time the Company was in no sense whatever a bank, nor ever called by that name. It was called the *Casa*, or *Ufficio di S. Giorgio* or the *Amministratori delle Compere di S. Giorgio*, and its financial business was to collect the taxes, and pay the dividends upon their shares. In 1674, they presented a petition to the Government, to be allowed to set up a bank, which was granted in 1675. And this is the true date of the formation of the BANK of St. George. It was decreed that by means of the Bank or its credit, or by means of the books of S. Giorgio and their notes, all bills of exchange, and mercantile obligations, however small, and all payments due in the city from all parts of the world should, be paid. The Bank's notes were made the only legal tender in the city for all payments above 100 lire, and they were to be received in payment of all taxes at the treasury. This Bank in a very short time acquired great credit, and its business increased so rapidly, that it was obliged to open four additional offices.

582. This Bank was at the height of its power and reputation when Law visited Genoa, and there is every reason to believe was what furnished him with the model of what he afterwards attempted to carry out on a much greater scale in Paris, and which ended in so great a catastrophe. The Bank continued to flourish till Genoa was

captured by the Austrians in 1746. It had advanced 15 millions of lire to sustain the war, and it had spent not only its own money, but also 1,333,088 lire of its depositors. The Austrians plundered it, and it was obliged to suspend payments. In 1750, the Senate ordered all the note-holders to inscribe their names in a register, called *Monte di Conservazione*, the debts were capitalised in shares of 200 lire, which were to be gradually redeemed by lot. Other of its obligations, called *paghe*, were also due to the amount of 64,000 lire. These were also capitalised, as a *Monte Paghe*, on the same terms as the others, and the shares were made transferable like stock. In 1777, there were only 2,251 shares, and 7,663 *paghe* unpaid, and they were then converted into public stock.

583. In 1794, Genoa was involved in the war of the Revolution, and it was taken by the French in 1797, who immediately abolished the Company of St. George. The public debts were placed under the protection of the honor of the State, and the circulation of its notes prohibited. In 1799, the sale of all its effects was ordered in order to discharge its obligations, but commerce was so utterly prostrated, that its property was sold at a very low value, and the proceeds were insufficient to satisfy all its creditors. Thus ended this extraordinary corporation. Attempts were made in 1804, and in 1814, to resuscitate it, but they failed.

Memorie sopra l'antico debito pubblico, mutui, compere, e Banca di S. Giorgio in Genova. By Carlo Cuneo. Genoa, 1844.

IN SWEDEN.

584. The Bank of Stockholm, founded in 1668, is remarkable as being the first, which, according to the testimony of Law, (*Mémoires sur les Banques*, p. 623. Edit. Guillaumin. 1851). Voltaire, (*Histoire de Charles XII.* p. 33., Edit. 1785.), and Hume, (*Life*, by J. H. Burton, Vol. II., p. 459) invented bank notes in Europe. The money of Sweden was of copper, and very inconvenient to make large payments with. A cart was required to carry a moderate amount of it. To remedy this inconvenience a public bank was established, in which the merchants deposited their copper money, and received bank notes in return for it, which were used in payments all through the country. Payments were also made by transfers in its books. In 1726 an edict enacted that the notes should be taken in payment of bills of exchange. This bank, although first instituted as one of deposit only, seems afterwards to have done commercial business, "For," says M. Gustave du Puyode, (*De la Monnaie*,

§c., p. 136.) "it lent, not only on bullion and other merchandise not subject to deterioration, but also on real property, to the amount of three-fourths of its value." In 1752 this had gone on to such an extent that it gave rise to great alarm; the bank's funds were deeply engaged in such loans, and the owners of the property were unable to redeem them. In 1754, the debtors were allowed to pay their obligations by annual instalments of of five per cent. We have read somewhere, but lost the reference, that when the exchanges were against the country, this bank used to suspend payments to prevent the drain. We much regret that so little is known in this country of the Political Economy of Sweden, where the third chair of the science was founded, and where it is said to have been cultivated with considerable diligence.

IN HOLLAND.

585. In Cisalpine countries the business of BANKING seems to have been first practised by the Dutch. And it was from them that several English writers, in the beginning of the 17th century, acquired their knowledge, and wished to introduce the business into England. Malynes, in his *Consuetudo, vel Lex Mercatoria*, published in 1622, explains their method of doing business. They did not issue notes, nor had they invented cheques. When a merchant had sold any of his credit in the banker's books, it was his custom to go and tell him to whom the credit was to be transferred. The inconvenience of this was obvious, and they subsequently either invented cheques, or adopted them from the Italians. John Law, writing in 1715, says that cheques were not then used in England, and describes the superiority of the Dutch method of doing business. At the end of the 16th century, it was contemplated to establish a bank of deposit at Amsterdam, but the intention was not carried out till 1609, when a considerable number of bankruptcies took place. An account of the Bank of Amsterdam is given by Adam Smith, Book IV., c. 3. It received all coins, foreign and domestic, at their actual weight in bullion, and gave the depositors credit in its books to that amount. A small deduction was made for the expense of management. This credit was called bank money, and as it always represented the real weight of bullion, it was usually at an agio of about 9 per cent. above the current worn, clipped, and degraded coins. It was enacted that all bills upon Amsterdam, above the value of 600 guilders, should be paid in bank money. The bank also received gold and silver bullion at a discount of 5 per cent., and gave the depositor a transferable receipt enabling the bearer to demand the bullion at any time within six months, upon re-transferring to the bank an amount of bank money equal to the credit originally given for the bullion, and paying one-fourth per cent. for silver, and one-half per cent. for gold bullion. If the term expired without payment of this premium, the bullion belonged to the bank at the price of the credit given.

586. So far all is clear. But Adam Smith then goes on to make a statement which seems to us to be perfectly unintelligible. He says, "The person who, by making a deposit of bullion, obtains both a bank credit and a receipt, pays his

bills of exchange as they become due with his bank credit, and either sells or keeps his receipt, according as he judges that the price of bullion is likely to fall or rise. The receipt and the bank credit seldom keep long together, and there is no occasion they should." Surely there is some extraordinary error here. How can a man, upon a deposit of £100, receive both a transferable receipt, and also a bank credit for an equal amount? That is as much as to say that, for every deposit, a man received credit to twice the amount. This part of Adam Smith's account of the bank's transactions, seems to us to be wholly unintelligible.

587. The Bank of Amsterdam professed to be a pure Bank of Deposit, that is, to make no use of its funds, but to keep in its vaults an equal amount of coin or bullion to all its obligations. Its stability was severely tested in 1672, in the French invasion, when every one rushed to demand his deposit. They were found perfectly intact, and of course this greatly raised the credit of the Bank. It became the great warehouse for bullion for foreigners, as well as natives. Notwithstanding its professions, and the solemnities with which each successive magistracy at Amsterdam swore to keep the treasure intact in the Bank's vaults, John Law shrewdly suspected that they did lend it out, and this was fully proved in 1794. They had for a very long series of years, notwithstanding all their oaths, been advancing large sums to the government, and to the Dutch East India Company, as well as to different municipalities in Holland. The first shock was given to its credit in 1790. In that year, (*Davies, Hist. of Holland, Vol. III. p. 557. Edit. 1851*) the East India Company found themselves in great difficulties. For many years, they had been suffering a heavy annual loss, and had only been supported by clandestine loans from the Bank, contrary to the oaths of its Directors. In December, 1790, the Bank found itself in imminent peril from these perpetual advances, and it suddenly announced that it would in future fix the price at which it would pay out the silver held in deposit. The first price fixed inflicted on its holders a loss of 10 per cent., and it refused to pay any deposits of less than 2,500 florins. This, which was nothing less than an open bankruptcy, excited the utmost astonishment and alarm. Its receipts immediately fell from 5 per cent. above par to one-half discount. This of course brought a run upon it, and after a short time the order was rescinded. The public, who at that time had no knowledge of its illegal proceedings, and had no ostensible cause of distrust, was pacified for the time. In 1794, the French entered Amsterdam, and upon investigating the affairs of the Bank, found that it had advanced nearly 11 millions of florins to the East Indian Company, and various cities. This of course was fatal to the Bank, and its notes immediately fell to a discount of 16 per cent.

588. We need not enter into any further details of the origin or history of banking in other countries, as what we have already given sufficiently illustrates the different principles adopted, which is our main object. While we have shewn the extreme erroneousness of the current opinions regarding the early origin of some of the most celebrated banks, we may say that the Bank of Barcelona was in reality the

oldest in Europe. It was founded, Capmany tells us, in 1401, by the municipality, for the use of the merchants. It was a bank both of deposit and discount, and the property of the city was pledged for the security of the depositors. It was thus founded 186 years before that of Venice, and 274 years before that of St. George. The Bank of Hamburg was founded in 1619, on the model of that of Amsterdam. The only peculiarity in it was that it gave credit on the deposit of jewels, as well as bullion. It is said to be nearly the only one of the old banks in Europe which still survives. For further information see **BILL BROKER; CREDIT MOBILIER; CURRENCY, PAPER; EXCHANGE BANKS; LAND BANK; LAW; MONTE DI PIETA; SAVINGS BANK.**

BANK MONEY.—The first Banks of Deposit, such as those of Venice, Amsterdam, Hamburg, &c., received coin and bullion from the merchants, and gave them a credit in their books for an equal quantity of bullion by weight, payable on demand. These credits were called Bank Money, *Moneta di Banco*. All bills of exchange drawn upon the merchants of these cities were made payable in this Bank Money, because it insured a uniform standard of payment. These banks, however, did not discount business, they merely received a certain quantity of bullion, which they professed to keep in their vaults, and gave an equal credit for it. Consequently this transaction did not increase the quantity of the currency. It has been supposed that our English banks, which do not issue notes, are similar to those Banks of Deposit. But this is a very grievous error; because our banks not only create credits, or bank money, by the purchase of bullion, but by the discount of bills of exchange. In fact, by far the larger portion of what are called *deposits* in banks, are merely *credits created by the discount of bills*, though they are invariably treated by English writers as deposits of cash. How erroneous this is, is shewn in the article **BANK**.

BANK NOTE.—A Bank Note is a promissory note issued by a banker, or banking company, and is usually in the form of a promissory note payable to bearer on demand. It is the highest and most powerful instrument of credit, and is more generally regarded as a substitute for money than any other.

2. Although a Bank Note is usually in the form of a promissory note of the banker payable to bearer on demand, yet it is quite clear that the *form* of the instrument is immaterial, any engagement of the banker, or liability, is equally effective. The Bank Charter Act of 1844, was passed for the express purpose of preventing the creation and issue of Bank Notes. That Act only contemplated Bank Notes in the form of promissory notes payable to bearer on demand. It was soon seen that the Act might be evaded by bankers giving their obligations in forms which were not Bank Notes. Thus, a cheque upon a banker payable to bearer on demand, and accepted by him, is, to all intents and purposes, a Bank Note. Many country banks had begun to issue obligations in such a form, which was a clear contravention of the intention of the Bank Act. In order to put a stop to this, the Stamp Duties Act, Statute 1854, c. 83, s. 11, defines what shall

be considered a Bank Note. It says, "In order to prevent evasions of the regulations and provisions of the said respective Acts, it is expedient to define what shall be deemed to be Bank Notes within the meaning thereof respectively. Be it enacted, that all bills, drafts, or notes, (other than notes of the Bank of England), which shall be issued by any banker, or the agent of any banker, for the payment of money to the bearer on demand; and all bills, drafts, or notes so issued, which shall entitle, or be intended to entitle the bearer or holder thereof, without endorsement, or without any further or other endorsement than may be thereon at the time of the issuing thereof, to the payment of any sum of money on demand, whether the same shall be so expressed or not, in whatever form, and by whomsoever such bills, drafts, or notes, shall be drawn, or made, shall be deemed to be Bank Notes of the banker by whom or by whose agent the same shall be issued, within the meaning of the Banking Acts."

3. Bank Notes are one of the varieties of promises to pay, one of the two grand divisions into which all instruments of credit are divided. (**PROMISSORY NOTES**). It is alleged that they were first used in Sweden. (**BANK OF SWEDEN**). Promissory notes were not recognized as part of the law merchant in this country till a very long time after bills of exchange, although they were in common use in Holland in the early part of the 17th century. Malynes, in his *Lex Mercatoria*, published in 1622, describes the bills obligatory, or of debt, then in use among the merchants of Amsterdam, Middleborough, and Hamburg, and strongly advocates their introduction into England. But the banks in Holland at that time did not use them. (**MALYNES**). It was about 1673 that the goldsmiths or bankers began to shorten their notes into the present form, but it was long before the law would sanction them, and when the Bank of England was founded in 1694, it was necessary to insert a clause to legalize its notes, and to make them transferable by indorsement.

4. The subject of Bank Notes might no doubt be discussed under the general terms **CREDIT**, or **PROMISSORY NOTES**, but there has been so much controversy respecting them, and their nature, that it will be more convenient to discuss them separately, and to examine the opinions of some writers respecting them. To investigate and understand thoroughly the nature of Bank Notes, and the functions they perform, will involve some of the fundamental conceptions, and several of the greatest subtleties in Political Economy, and a full discussion of the subject will clear our way to strike at some very prevalent fallacies.

5. We have pointed out (**PRELIMINARY DISCOURSE; CURRENCY; TURGOT**;) the immense service Turgot did to the science of Political Economy by establishing the proposition that money is a separate and independent article of value. The great fallacy which he successfully combated was that money was the *sign* or *representative* of value, (**MONTESQUIEU**), and it was upon this fundamental misconception that John Law's theory of money is founded. Because he argued this way, that money being only the *sign* or *representative of value*, or the representative of material wealth, it was of no consequence of what material money was made, and that there might

be as much money as there was material wealth, and consequently that as much paper money might be created as would represent all the material wealth of the country. (Law).

6. Turgot struck at the root of this fallacy by shewing that money is not a *sign*, or *representative* of value, but an independent article of value itself. He says, of gold and silver, "Ils ne sont point, comme bien des gens l'ont imaginé, des signes de valeurs; ils ont eux-mêmes une valeur. S'ils sont susceptibles d'être la mesure et le gage des autres valeurs, cette propriété leur est commune avec tous les autres objets qui ont une valeur dans le commerce," (*Sur la formation et la distribution des richesses*, § 45), and this doctrine has been approved of, and adopted by all economists of any note since his day. This principle is the foundation stone of Political Economy. But Turgot left his work incomplete; for it is not enough to shew that money is an article of independent value, but it is also necessary to shew *how much* money is required. And that we have done in our *Elements of Political Economy*, and in the article CURRENCY. We have shewn that when an exchange of equal values in commodities takes place there is no room, or necessity, for money, but that when an *unequal* exchange takes place, then a certain quantity of money is required to make up the balance. Hence, the quantity of money required is the quantity of *debt* that would ensue if there was no money, and thus it is in its nature a general instrument of credit, as Burke and Adam Smith saw. Hence, we not only shew that money is an independent quantity, but we also shew the quantity of it that is required.

7. But the very same authors, Turgot, and J. B. Say, who have done so much to lay the corner stone of Political Economy with respect to money, are the very ones who have done incalculable mischief, and are the authors of immense error with respect to credit, and of exactly the same nature, too, as what they delivered the world from with respect to money.

8. Up to a comparatively recent time it was always customary to consider an instrument of credit as *representing* goods; thus a bill of exchange was universally treated as *representing* the goods which it was exchanged for. This fallacy, however, is now slowly and gradually dispersing. Mr. Thornton, in his essay upon Paper Credit, was among the first to notice it, and at the present day it is only very careless and ill informed writers who speak of bills of exchange, as *representing* commodities. It is perfectly well understood that there is no connection whatever between a bill of exchange and the goods it purchases, or is exchanged for. Nor does a bill of exchange *represent* money, because there is no connection between it and any particular money, but it is only an engagement to pay money, and derives its whole value from the belief that at a particular time it will be exchanged for money. Thus, the clouds of error slowly disperse, and by toilsome marches progress is at length effected.

9. But this identical fallacy, which was first dispelled with respect to money, and next with regard to bills of exchange, is still almost universally prevalent with regard to Bank Notes. Bank Notes are a promise to pay money on

demand, and a banker is bound to have money to pay them with on demand, and consequently they are supposed to *represent* money. But this is a *profound delusion*. Bank Notes do not *represent* money at all. Instruments of credit are not *signs*, or *representatives* of value, as even the best writers too often say, but they are independent articles of value themselves.

10. In this article, as well as those on *BILLS OF EXCHANGE, CREDIT, and PROMISSORY NOTES*, we shall endeavour to complete the work begun by Turgot, with respect to money, by extending its arguments to instruments of credit.

11. When two ideas are superficially similar, but really distinct, the best way to exhibit the difference, is to bring them into the closest contrast. We shall, therefore, enforce the doctrine just stated, by contrasting Bank Notes with another class of negotiable instruments, with which they are very often confounded, but from which they are nevertheless fundamentally distinct; and upon the confusion of which Law's theory of money is based. These other negotiable instruments are Bills of Lading, and Dock Warrants, (*BILL OF LADING; DOCK WARRANT.*) which have some points of resemblance with bills of exchange, and are often supposed to be of the same nature. The instrument of credit, however, which a Bill of Lading, or a Dock Warrant, most resembles is a Bank Note, and we shall now contrast them.

12. When property is deposited in the warehouse of a dock, the owner of it receives a paper called a Dock Warrant, which he can transfer by endorsement to any one else, who can endorse it over to any one else, and so on. Or a shipmaster gives a receipt for the goods he receives on board, called a Bill of Lading, which the owner of the goods can transfer by endorsement to any one else, and so on. And any holder of the Dock Warrant, or Bill of Lading, may have the goods on demand. These instruments *represent* goods. When a customer deposited money in a Bank, he received an equal amount of Bank Notes, which formerly he could transfer by endorsement to any one else, who might endorse them to any one else, and so on, and the holder of the note might demand payment of it on demand from the banker. In modern times, it is true, the endorsement of a Bank Note has fallen into disuse, but when they were introduced it was indispensable, and it in no way affects the question we are discussing. Now, because the holder of a Bill of Lading, or a Dock Warrant, can obtain the goods on demand, and the holder of a Bank Note can obtain money on demand, and they are all negotiable instruments, it is a very common opinion that these instruments are all of the same nature, and that as Bills of Lading *represent* goods, so Bank Notes *represent* money.

13. It is, nevertheless, one of the most fundamental conceptions in Political Economy, that these instruments though presenting some points of superficial resemblance, are yet fundamentally distinct. And to understand the nature of this distinction is the basis of the theory of money. The confusion of these two things is at the root of two very opposite schools of error, for it is upon not comprehending this distinction that the schemes of basing paper currency upon land, upon commodities, and upon the public funds, are founded,

which is Law's Theory of Money, which has led to so many frightful catastrophes, and which is at the root of much of the vice of American banking. But the same fallacy is also at the root of a very opposite school of error—namely, that of the currency principle. One party wish to confine bank notes to the exact amount of specie they displace, the other party wish to extend the issue of paper money, so as to *represent* all values, as well as specie, or to mobilize all values, as their jargon is.

14. In order to exhibit clearly the fundamental distinction between these two species of paper instruments, we shall shew how each arises.

When a man delivers goods to another, to carry, or to keep for him, it is termed in law a **BAILEMENT**. Though the bailee, or the person to whom the goods are entrusted, grants a receipt for them, which may be transferable by indorsement, and he may engage to deliver them to any person to whom this receipt may be lawfully transferred, the receipt and the goods constitute *one* property. The bailee has no property in the goods, but merely the duty to keep them safely, and deliver them to the true owner on demand. The actual property of the goods goes with, and is inseparable from, the Bill of Lading, or the Dock Warrant, which is therefore truly said to *represent* those goods, and the property of those very goods is transferred with every transfer of the document. If the bailee of the goods were to convert them to his own use, he would be a thief, and indictable for the crime.

But when a customer deposits money with a banker the case is entirely different. As soon as the money is paid into the bank, the property of it passes to the banker, and the receipt, or note, he gives for it is totally severed from it. The customer transfers the property of the money to the banker, and receives in return an instrument of credit, which is *not* a title to any specific money, but only a general right to demand money. And this bank note circulates independently, and derives its value from the general belief that it may be exchanged for money if required. It is in no respect whatever a *bailement*, but a *sale* of money to the banker. When a customer deposits money with a banker the real nature of the transaction is this: It is a sale of money to the banker, with the right reserved of demanding the re-sale of an equal quantity of money at will. And there is, in fact, a *new* property created, namely, the instrument of credit, or promise to pay, which may pass through a hundred hands upon the mere faith that it may be exchanged for money if required. It is, therefore, quite clear that this bank note does not *represent* money in the same sense that the former documents represent goods, but that it is exchangeable for money, which is the very thing which gives everything else value.

15. Now, if the banker was a mere bailee of the money, *i. e.*, merely entrusted with it for the purpose of keeping it safe for his customer, as he is very frequently with other securities, deeds, &c., there would be no fresh property created, and he would have no right to use the money for his own purposes. And there is a very severe Act of Parliament enacting very heavy penalties against any banker who converts to his own use property which is merely entrusted to him. But as soon as the money passes into his possession,

the property of it vests absolutely in him, and he is entitled to use it in any manner he pleases for his own profit. The bank note, or instrument of credit he gives is totally severed from any connection with any specific money. Thus we see the fundamental distinction which creates an impassable wall of partition between instruments of credit, and bills of lading or dock warrants, is, that the latter are inseparable from and *represent* goods, and are not separate articles of property, the former are expressly severed from, and do *not represent* any money, but are separate and independent articles of property. Bank notes and bills of exchange are *credit*; bills of lading and dock warrants are *not credit*.

16. That bank notes are articles of independent value is illustrated by the well known fact that they expel coin from circulation, because they perform the same duty at less expense. A bank note is a substitute for coin, too often a dangerous one, it is true, but yet one which has universally the power of expelling its rival. But nobody ever considered a bill of lading as a *substitute* for the goods. An excessive issue of paper diminishes the value of the gold currency, but nobody ever thought that a bill of lading, or a dock warrant, diminishes the value of the goods they represent. A bank note is used instead of coin, but nobody ever thought of using a bill of lading, or a dock warrant, instead of the goods. People in possession of bank notes think them equivalent to money, but nobody ever thought a bill of lading equivalent to a cask of sugar or a chest of tea. People put bank notes into their purses believing them to be cash, because they perform the functions of cash, but nobody ever put a bill of lading into his tea-pot thinking it was tea, or could perform the functions of tea; or put a dock warrant into a goblet and quaffed it off as Bordeaux! Hence we obtain this as one of the fundamental conceptions of Political Economy, that bank notes are separate and independent entities, bills of lading and dock warrants are nothing but tickets on goods, and have no separate existence whatever.

17. The preceding considerations are enough we hope to satisfy our readers that bank notes are independent entities. This is one immense step gained. We must now inquire why they have value. Now, if we were to ask 1,000 persons why a bank note has value, the whole would with one voice reply, Because it is believed to be exchangeable for money or goods at the will of the holder. And this is undoubtedly the true answer. But if we were to ask the same 1,000 persons why gold money has value, the probability is that 999 would reply, Because a great deal of labor has been bestowed on producing the gold of which it is formed. That is, they would say that gold money has *intrinsic value*, and that the bank note is the *representative of value*. That is, they would say that a bank note has value because it can be *exchanged* for something, and gold money has value because it has cost labor. **CERTAINLY NOT**, say we. Such an answer as this is directly in contradiction to all modern science. The laws of modern science enable us to say at once that the reason why bank notes have value, and the reason why gold money has value, *must* be the same. If the *labor* which has been bestowed upon producing it is the cause of the

value of gold, modern science affirms that whatever labor has been bestowed upon must have value, and of course the value of a thing must be proportional to the labor expended upon producing it. Thus the oyster shell in which a pearl is found, must be of the same value as the pearl itself, because they are both obtained with the same labor. If labor is the cause of value, a diamond of a very poor quality, which is found after the search of a year, must be 365 times more valuable than a diamond of the first water which is found after the search of a day. Now these are the consequences which modern science inevitably deduces from the doctrine that labor is the cause of value. The manifest absurdity of these consequences entirely overthrows the doctrine that labor is the cause of value. If labor is the cause of value, whatever labor has been bestowed upon must have value; therefore, if any one were to go and rear a great pile of stones in the middle of Salisbury Plain it would be of great value! How often do we see a thing upon which a great deal of money or labor has been bestowed, turn out of no value! Now it is perfectly clear that it is *not* the labor which has been expended in producing gold which gives it value, but its exchangeability, or the eager desire for it among men. Gold has not value because men labor to produce it, but men labor to produce it because it has value. *It is not the labor that confers the value, but the value that attracts the labor.* Hence we see that gold money and bank notes have value for exactly the same reason,—their *exchangeability*, the one, however, possessing this quality to a greater degree than the other.

18. Now money in itself is of no direct use to mankind; it is neither meat, nor drink, nor clothing, nor any other utility, it is merely the means of obtaining them. When a man has performed services to others, and requires no direct utilities himself at the time, money is the form in which he preserves the record and the amount or value of those services, so as to be able to obtain an equivalent utility at any future time he pleases, and of what nature he pleases. It is thus **GENERAL CREDIT**, but a bank note is **PARTICULAR CREDIT**. A bank note, or any other instrument of credit, is a valuable thing, because there is some one bound to exchange something for it at a certain time; money is general credit, and has value because every one will exchange something else for it.

19. Thus we obtain one of the great fundamental conceptions of political economy, that money and instruments of credit of all sorts, are all homogeneous quantities, they all represent debt, or services due to the owners of them, and the aggregate of them forms the **CURRENCY**.

20. We may now investigate another part of the question which has been much clouded by controversy, but a due inquiry into which will well lay bare the foundations, or first principles of political economy. Are bank notes capital? And are they an addition to the wealth of the country? No one doubts that money is a portion of the wealth, or capital, of the country, and many writers admit that bank notes are capital to the individual who utters them. But many writers who admit them to be capital to the person who utters them, would deny that they are any addition to the wealth of the country. Because they

would argue that as they are debts, or liabilities of the issuers, they must be *subtracted* from his other property, and consequently they are not any addition to the wealth of the country.

21. Now, how any article whatever can be capital to an individual, and not capital to the country at large, is, we confess, to us wholly unintelligible. It certainly would appear that the capital of the country must be the aggregate of the capitals of each individual; and how a thing which is admitted to have an existence in the one case, can suddenly vanish into nothing, when it is reckoned in another form, seems to us to be wholly incomprehensible. Nevertheless, such is the doctrine of some well known writers.

22. This view is so clearly and manifestly erroneous with respect to commercial bills of exchange, and all liabilities payable *in futuro*, and is so fully treated of under **BILLS OF EXCHANGE** and **CREDIT**, that we refer to those articles, and shall say no more about them here. But, with respect to Bank Notes and obligations payable on demand, the case is not all so clear, and is much more subtle, and will require more examination. And yet, curiously enough, the instruments of credit which are of the more subtle nature are often admitted to be capital, while those about which there is no real ambiguity at all, are universally denied to be so—at least in modern times.

23. But, in truth, the real explanation of the case touches the very first principles of Political Economy and its true conception as a science.

Every science whatever depends upon certain fundamental conceptions, and, in stating the facts of the science, it is essential that they be stated in a peculiar manner, and in one in harmony with the fundamental conceptions of the science. And true scientific tact greatly consists in perceiving how the facts are to be stated. Now, as we contend that the true fundamental conception of the science of Political Economy is, that it is the science of exchanges, it follows that every question in Political Economy must be stated so as to be in harmony with its fundamental conception. Now, to state the question of instruments of credit, as it is usually stated by the most eminent writers, is to state it as a question of *addition and subtraction* and not of an *exchange*. Now, an instrument of credit is an exchangeable quantity, and is to be treated like any other independent quantity whatever. And as we have shewn that any economic entity may be used and employed as capital, (**CAPITAL**), it follows manifestly that an instrument of credit may be capital as well as anything else.

24. We shall find that this view of the fundamental conception of the science will throw much light on the early stages of Political Economy, and that this is the philosophical rock upon which the Physiocrate school made shipwreck.

The Physiocrats maintained that all wealth came from the earth, (**PRELIMINARY DISCOURSE; PHYSIOCRATES**), and that there were but three kinds of productive laborers:—Firstly, hunters, fishermen, and breeders of domestic cattle; secondly, agriculturists properly so called; and thirdly, miners. These alone they called productive laborers because they increased the quantity of material productions. All other industry, such as manufacturing, they called *sterile* or

unproductive, because it only changed the form of existing products. And they argued this way. They admitted the necessity and utility of this unproductive industry, but they said that this kind of labor did not add to the wealth of the world, because, in the process of manufacture, an equal value was *consumed* to what was *produced*; and, therefore, the result was not more valuable than before. And it was upon this view that they based their doctrine that the *produit net* of land, was the only addition to the wealth of the country.

Now, this doctrine was felt to be erroneous, and was superseded by the doctrine that labor was the source of all wealth, which, though more specious and plausible, yet has been equally fatal, because it has led to the erroneous doctrine that labor is the *cause*, and the only cause of value, and the followers of that school have been unable to see that any object could have value except through the means of labor having been bestowed on it, and they measure the value of a thing by the labor expended upon producing it. Now, the fact is that wealth consists in the acquisition of objects which possess the quality of exchangeability, no matter whether they have been produced by much or by little labor, although it is generally true that objects of great value are scarcely ever produced without great labor. Still it is not the labor which gives them their value, but simply their exchangeability. Nor is their value in any way dependent upon their durability. Whenever two things are freely exchanged in the market they are of equal value, no matter whether one is permanent and the other evanescent. The doctrine, however, of the second school of Political Economy superseded that of the Physiocrats, and it was seen that the labor of the manufacturer or the artisan is as truly *productive* labor as that of the agriculturist, or the herdsman and hunter.

25. But the true philosophical objection to the Physiocratic doctrine is not the one that superseded it, namely, that labor is the source of wealth, but it is this that they stated the facts as a question of *addition and subtraction*, whereas they ought to have made it one of exchange. The food, &c., consumed by the workmen was given in exchange for their labor, and they were of equal value, because they were exchangeable. The food was an article of independent value, and the labor was an article of independent value, and the laborer gained by exchanging his labor for food, clothes, &c., and the manufacturer gained by exchanging his money for labor, because when the article is completed he sells it for more than he pays for it, and the difference is his profit. And this is also the true philosophical objection to the method of stating the question of credit, in general use among Political Economists, because they make it a question of addition and subtraction, whereas it must be stated as a question of exchange. Thus, when a banker issues his notes, they set off the quantity of his assets against the amount of his liabilities, and *subtracting* one from the other they make the result the amount of his property. But this is the identical error which was fatal to the Physiocrats. The true way of looking at it is that both the "assets" and the "liabilities" are independent quantities. The credit of the merchant and the credit of the banker are each of them independent and sub-

stantial property, and for a banker to give his notes in exchange for a bill of exchange, is to exchange one species of property for the other, and not to cancel one amount by setting it off against the other. Each instrument of credit is an independent entity, capable of being exchanged, through a larger or smaller area, as the case may be. It is similar to the exchange of a large and inconvenient Bank Note for smaller and more convenient money.

26. And economists who utterly repudiate and sneer at the notion that credit in general is capital, fully admit that Bank Notes are capital. Though how one form of credit can be capital, and another form not capital, is to us a doctrine which is unintelligible. Thus, Mr. Mill, whose doctrines on credit are fully examined elsewhere, (CREDIT; MILL, JOHN STUART,) maintains that Bank Notes are productive capital. (*Principles of Political Economy*, Book III, chap xxii. § 2.) "The value saved to the community by thus dispensing with metallic money is a clear gain to those who provide the substitute. They have the use of twenty millions of circulating medium which have cost them only the expense of an engraver's plate. *If they employ this accession to their fortunes as productive capital, the produce of the country is increased and the community benefited as much as by any other capital of equal amount.* * * When paper currency is supplied, as in our own country, by bankers and banking companies, the amount is almost wholly turned into *productive capital*." And we might quote many other passages to shew that Mr. Mill treats, and quite correctly too, bank notes as capital. And Mr. McCulloch makes exactly the same admission (*Art. Banks, Commercial Dictionary*.) "Those who issue such notes coin, as it were, their credit. They derive the same revenue from the loan of their written promises to pay certain sums that they would derive from the loan of the sums themselves, and while they thus increase their own income, they at the same time contribute to increase the wealth of the society." That is, in this passage he admits Bank Notes to be productive capital. Though both these writers when they treat of credit in general, peremptorily deny that it has any productive efficacy whatever. (CREDIT.)

27. Dr. Whewell (*Nov. Org. Renovat: Chap V. On certain characteristics of Scientific Inductions*) points out many instances in the progress of the different Inductive Sciences, where classes of phenomena of apparently the most remote and unconnected character, have all suddenly been accounted for, by the discovery of the true conception or theory of the science. And this he calls the *Consilience of Inductions*. And he says that "No example can be pointed out, in the whole history of Science, so far as I am aware, in which this consilience of Inductions has given testimony in favor of an hypothesis afterwards discovered to be false." Now, correlative to this Consilience of Inductions we may have a *CONSILIENCE OF REFUTATIONS*, by which errors of apparently the most remote and unconnected character, are simultaneously disproved by obtaining a true conception. As soon as we obtain a clear and firm grasp of the conception of exchange, the fundamental error of the Physiocratic school of Political Economy, and of the preva-

lent doctrines on the subject of credit, are at once made clear and manifest. As soon as we obtain a clear and firm grasp of the true conception of the nature of money, the errors of the currency principle and of Law's theory of paper currency are at once made clear and manifest. And Political Economy abounds with similar instances.

28. And this is the great master-subtlety of Political Economy—this is the true *pons asinorum* of the subject—that instruments of credit, though they must be expressed to be payable in money generally, are yet expressly forbidden to be appropriations of any particular sum of money. They, therefore, circulate independently on the belief that they may be exchanged for money, just as money circulates on the belief that it may be exchanged for commodities. And as money does not represent commodities, although it is exchangeable for them, so instruments of credit do not represent money, though they are exchangeable for it. Consequently they are, therefore, to be regarded in the same light as any other independent quantities whatever. In fact, credit is itself property, of the same nature as any other immaterial capital. But bills of lading or dock warrants are not independent quantities, but mere tickets on the goods they represent, and therefore they never can exceed in quantity the property to which they belong. But instruments of credit not only may, but do actually exceed greatly—five or six times at the least—all the cash in the country. For if a banker, for example, keep only cash enough to meet the payment of the notes which may usually be demanded from him, that is enough to support the credit, or the exchangeability, or value, of all the rest. No doubt, it may be said, that if all his notes were thrown upon him for payment at once, he could not pay them all, and their value would fall; but the very same thing may be said of all other property. The value of all property depends upon only a certain quantity of it being offered in exchange at any one time. If all the land in England were suddenly offered for sale at the same time, where would its value be? Or if all the shipping in the country were offered for sale at the same time, where would its value be? Thus the value of instruments of credit depends upon exactly the same laws as the value of any other property, namely, that only a certain portion of them are offered for exchange at any one time.

29. But it may be said that these views depend upon a particular method of stating the facts, and that if they are stated in another way, which they are capable of being done, it will lead to different conclusions. And this is undoubtedly true; but then the very same thing may be said of all science. All science depends upon a particular method of stating the facts. And, therefore, it may in some sense be said that all science is a matter of *opinion*. And this cannot be denied. But it is in this very thing, that true philosophical tact consists—out of several possible modes of stating facts, to select that particular one which is to be made the true basis of the science. And having once obtained this fundamental conception, it is to be inflexibly and rigorously adhered to, and all others are to be rejected. And this is exactly what has happened

in the early stages of all the sciences, namely, that their early cultivators did not distinctly perceive what their true fundamental conceptions were. But in the greater part of the physical sciences, and in mechanics especially, men of competent judgment, after full discussion and deliberation, have finally and unanimously agreed what are the true fundamental conceptions of each, and have uniformly adhered to them in their treatment of the subject. And this, in our opinion, is the true meaning of that much abused phrase, COMMON SENSE. It is not any plausible explanation that may seem on a superficial view to suit the facts, but that solemn and final opinion which men of competent judgment, after full deliberation, finally arrive at and agree to. No man can tell what common sense on any subject is, until he is fully master of it. And that, and that only, is the true fundamental conception of a science, which enables us to penetrate to its innermost recesses, which solves the most obscure problems in it, and unravels ALL its mysteries.

30. The fact is, a science is not unlike that amusing puzzle for children, a *Labyrinth*. There are a number of side entrances all exactly similar in appearance. But after a certain time, all of them, except one, terminate in nothing, some have ingot nearer to the centre than others. But there is one, and one only, which leads us into the heart of the puzzle. So it is with a science. There are at the threshold of every science several conceptions which present, perhaps, no peculiarity to determine us in favor of any one of them, rather than the others, and which, to the untrained mind may seem all indifferent. But there is, nevertheless, only one true golden *filum Labyrinthi*, which can lead us to the innermost recesses of Nature, and which that one is, is only to be determined by men properly qualified to do it. The way to construct a science is not to take some principle, which perhaps may be plausible enough on a superficial view, and to follow that to its consequences, and then to reject all facts which do not agree with it, but a philosophic mind brooding over the facts of the science, heaped together in wild, and apparently hopeless confusion, at length, perhaps, in some happy moment discerns the true fundamental conception which reduces everything to harmony and order.

31. Nor is it always the men of the greatest intellect who succeed in selecting the true idea. It often comes, no one can tell how, or when, by some seemingly happy chance, and scarcely ever without many unsuccessful attempts. How long it was in the slow gestation of ages, before men of the highest capacity could seize the true fundamental conceptions of mechanical science. There is nothing more melancholy in looking back into the depths of antiquity than to see the wrecks of the labors of the mightiest intellects. There is nothing more sad than to see the demigods of humanity struggling in the death grasp of false conceptions.

32. Now, after mature consideration, and after having carefully examined what preceding writers have said upon the subject, we have come to the deliberate judgment that the true fundamental conception of Political Economy is that it is the science of exchanges, and that this conception is the only one which will enable us to resolve all its phenomena. Consequently, having

adopted this view, and following the example of all the great masters of Physical Science, we maintain that the true object and limit of the science is to discover the laws which govern the phenomena of exchanges. (PRELIMINARY DISCOURSE.) Moreover, having adopted the idea of exchangeability as the true meaning of value in Political Economy, it follows that all conceptions contrary to it are delusions and snares, and must be inexorably rejected, and further, that all modes of stating the questions in Political Economy, which are not in harmony with this conception, are erroneous. Hence all expressions which are inconsistent with the idea of exchangeability must be carefully guarded against, as sources of confusion. Now there is one expression which is in constant use by almost all economists, and which concentrates in itself the roots of most of the errors in the science—and that is, *intrinsic value*. The expression *INTRINSIC VALUE* is the CURSE and the BANE of Political Economy. It is the combination of two absolutely inconsistent and contradictory conceptions. This was pointed out by Nicholas Barbon, in 1696, (BARBON), and in much more recent times with irresistible force by Mr. Samuel Bailey. (BAILEY.) As soon as we grasp the conception that value is an *external relation*, and not a *quality*, the expression *Intrinsic Value* is seen to be palpably absurd. And this is in truth the great conception which sheds a blaze of light over the whole science, and which enables us to understand and comprehend the real existence of entities in Political Economy, which can neither be *handled*, nor *seen*, but which may yet be *measured*, such as intellectual capital, copyrights, the goodwill of a business, credit, and all incorporeal property. (PRELIMINARY DISCOURSE; CAPITAL.)

33. We shall now examine into certain opinions which are held respecting bank notes, by an influential—nay, the most influential—sect at the present day. Up to 1832, the immense majority of writers and speakers considered that bills of exchange, and other instruments of credit, form part of the currency, or circulating medium, of the country. About that time, however, it began to be denied by some persons that bills of exchange are currency, and this opinion gathered strength till in 1840 it appears to have been adopted by the majority of the commercial witnesses. We shall not in this place inquire into the general conception of the term currency, as that is done in its proper place. (CURRENCY.) We shall here only inquire into certain opinions held respecting bank notes by these writers.

34. This sect then, of whom we may consider Lord Overstone and Colonel Torrens to be the most prominent advocates, maintain, not only that bank notes are the highest and most efficacious instruments of credit—which everybody admits—but that there is a positive distinction in kind between bank notes and all other forms of credit, such as bills of exchange, cheques, &c., and that specie, and bank notes payable to bearer on demand, alone—to the exclusion of all other forms of credit—constitute the money or currency of the country. They also use the terms money and currency as synonyms. Lord Overstone, then Mr. Loyd said, in his evidence before the Committee of the House of Commons, in 1840, Q. 2663-4, “The precious metals converted into

coin constitute the money of each country. That coin circulates sometimes in kind; but in highly advanced countries it is represented, to a certain extent, by paper notes, promising to pay the coin to bearer on demand, *these notes being of such a nature in principle that the increase of them supplants coin to an equal extent*. When these notes are in use, the metallic coin, together with these notes, constitutes the money or currency of that country. Now this money is marked by certain distinguishing characteristics; first of all, that its amount is determined by the laws which apportion the precious metals to the different countries of the world; secondly, that it is in every country the common measure of the value of all other commodities, the standard by reference to which the value of every other commodity is ascertained, and every contract fulfilled; and thirdly, it becomes the common medium of exchange for the adjustment of all transactions equally at all times, between all persons, and in all places. Now I conceive that neither deposits nor bills of exchange in any way whatever possess these qualities. In the first place, *the amount of them is not determined by the laws which determine the amount of the precious metals in each country*. In the second place, they will in no respect serve as a common measure of value, or a standard by reference to which we can measure the relative values of all other things; and in the next place, they do not possess that power of universal exchangeability, which belongs to the money of the country.”

35. Any one who examines the preceding extract will perceive that it consists of a series of dogmatic assertions and arbitrary assumptions, which it is only possible to meet by counter assertions, and we shall not investigate the grounds of these here, because that is done under CURRENCY. We only quote the passage as an expression of opinion which is adopted by many influential persons. We shall now quote from a writer who supports his assertions with reasons, and we can, therefore, examine into the validity of those reasons. Colonel Torrens says, (*The principles and practical operation of Sir Robert Peel's Act of 1844 explained and defended*. Third Edition, p. 1.) “While Lord Overstone and Mr. Norman maintained, in accordance with the principles established by Adam Smith and Ricardo, that the money or currency of the country consists of coin and bank notes immediately convertible into coin, Mr. Tooke and his followers advanced the *novel* doctrine, that bank notes, immediately convertible into coin, do not possess the properties of money, that they are, in common with cheques and bills of exchange, mere forms of credit.” Now we have shewn under CURRENCY, that this assertion of Colonel Torrens is absolutely without foundation. Mr. Tooke did *not* introduce a new doctrine; on the contrary, up to 1840 the immense majority of writers and speakers were of that opinion, and, in fact, the restriction of the term currency to money and bank notes exclusively, is the novel doctrine.

36. Colonel Torrens, therefore, having commenced his work with an unfounded assertion, then gives us his definition of money. “Money may, therefore, be defined as consisting of those tangible objects which can be passed from hand to hand, which law, or usage having the effect of

law, has established as measures of value, as media of exchange, and as equivalents by the tender and acceptance of which *payments are made and transactions finally closed.*" He also says, (p. 79, *First Edition*,) "The terms, money and currency, have hitherto been employed to denote those instruments of exchange which possess intrinsic or derivative value, and by which, from laws or custom, debts are discharged and transactions finally closed. Bank notes, payable in specie on demand, have been included under the term as well as coin, because, by law and custom, the acceptance of the notes of a solvent bank, no less than the acceptance of coin, liquidates debts, and closes transactions; while bills of exchange, bank credits, cheques, and other instruments by which the use of money is economised, have not been included under the terms money and currency, because the acceptance of such instruments does not liquidate debts, and finally close transactions." Colonel Torrens has also quoted, in support of his opinion, the judgment of Lord Mansfield in the case of *Miller v. Race*.

37. The poet sings—

"Ay me! What perils do environ
The man who meddles with cold iron."

So are the perils which environ the unprofessional writer who meddles with law cases. There is no man who has a professional knowledge of the law of instruments of credit, who will not at once perceive the fallacy of Colonel Torrens's opinions. The judgments of the judges are always to be interpreted with special reference to the circumstances of the case, and every case, to be rightly understood, necessarily requires a considerable amount of knowledge which does not appear on the face of it, but which every lawyer would bring to the study of it, and which it is indispensable to the right understanding of it. Moreover, every lawyer reads the judgments in a doubting spirit. In the first place many of the old reports are of very doubtful authority; we are not certain of their accuracy. But a still greater source of error arises. In former times judges were much more in the habit of giving general judgments, and entering into collateral points; in modern times they confine themselves strictly to the point at issue, and sedulously avoid opening up collateral points which are not before them. No lawyer reads the judgment of any judge as an infallible gospel. We shall find that these remarks forcibly apply to the case we are going to discuss. In the first place we are not certain of the accuracy of the report. In the second place, it is such a judgment as we are perfectly certain that no judge in the present day would deliver. For if Lord Mansfield delivered it as reported, it not only decides the special point in issue rightly enough, but it also contains several general and sweeping assertions, which we shall shew are very far indeed from being accurate, but which are not necessary for the decision of the case, and which were not specially argued.

38. We shall, therefore, explain to our lay readers such preliminary considerations as are essentially requisite to comprehend the true bearing of the case of *Miller v. Race*. There are three species of property known and recognized by the common law of England, the transfer of which is subject to distinct rules. Firstly, Goods and Chattels or commodities; secondly, Money;

and thirdly, *Choses in action*, or claims, or liabilities, such as debt. Now, with respect to the first description of property, it is the well known rule of the common law that the property in a personal chattel cannot be transferred to a buyer however innocent, by a person who does not himself possess it, *except by a sale in market overt*. That is to say, that if a thief steals my property and sells it to somebody else privately, who buys it honestly and gives a full price for it, yet I can recover it from the innocent buyer. If, however, the property is sold in market overt the case is different, the buyer may keep it against the true owner. But with respect to money, although the true owner might recover it from a thief, he cannot recover it from a person who has come by it honestly in a fair sale. Thus, if a man steals my money, and goes and buys goods with it in a shop, I cannot recover it from the shopkeeper who takes it in the way of his trade. Thus, the possession and the property are inseparable. But, with respect to the third species of property, *choses in action*, or debts, it is an inflexible rule of the common law that they cannot be transferred at all. Thus the transfer of bills of exchange, which are debts, is in direct contravention of the common law. But in course of time the common law adopted the *Lex Mercatoria*, and by the *Lex Mercatoria*, or *custom of merchants*, Bills of Exchange were treated like money in so far as this—that the property in them passed like money. Thus, though if they were stolen the true owner might recover them from the thief, yet if he passed them away for value, *bonâ fide* to an innocent holder, that innocent holder for value acquired the property of them, and might retain them against the true owner, and enforce payment from all the parties liable. Thus Bills of Exchange were assimilated to money in this important respect, that the possession and the property in them were inseparable.

39. But the courts of law for a long time refused to recognize promissory notes as within the law merchant. By the Act founding the Bank of England, their notes were legalized and made assignable by indorsement, (Act, Statute 1694, c. 20, s. 29). But this did not extend to other promissory notes. In the cases of *Clerke v. Martin*, (2. L. Raym, p. 767), in 1701, and *Buller v. Cripps*, (6. Modern Reports, p. 29), in 1703, the court held that promissory notes were not assignable, or indorsable over, within the custom of merchants. In consequence of these decisions the Act, Statute 1704, c. 8, was passed, by which it was enacted that promissory notes in writing made and signed by any person, or persons, body politic, or corporate, or by the servant, or agent of any corporation, banker, goldsmith, merchant, or trader, promising to pay any other person, or the bearer, any sum of money, should be assignable and indorsable over in the same manner as inland bills of exchange. But, though this Act conferred upon promissory notes certain of the privileges and qualities of bills of exchange it made no mention of other modes of transferring the property, and there was no case to decide whether their property passed with the possession to an innocent holder for value, as in the case of money and bills of exchange. Thus there was no case to decide how the property of a stolen note would pass.

40. Such was the state of the law when, on the 11th December, 1766, William Finney, who was the owner of a Bank of England note, sent it in a letter by post to a friend in the country. On the same night the mail was robbed, and the note in question was carried off. On the 12th of the same December, the note came into the possession of the plaintiff, for a full and valuable consideration, in his usual course of business, and without any notice or knowledge of its having been stolen.

Mr. Finney, on the 13th of December, being informed of the robbery, applied to the Bank of England to stop payment of the note. Some time afterwards the plaintiff applied to the bank for payment of the note, and for that purpose delivered it to the defendant, who was a clerk in the Bank, but the defendant, Race, refused either to pay it, or to redeliver it to the plaintiff.

The plaintiff brought an action against the defendant to recover possession of the bank note, and the jury found in his favor, subject to the opinion of the court, "whether, under the circumstances of the case, the plaintiff had a sufficient property in this bank note, to entitle him to recover in the present action."

Thus, the point in issue before the court was simply this—"Whether an innocent holder for value of a stolen bank note acquired a property in it by delivery, and was entitled to retain it against a former owner from whom it had been stolen?"

It was admitted that the usage of trade was that bank notes were paid and received as cash, and that they passed from one person to another by mere delivery like cash, and that the possession always carried with it the property.

It was contended by Sir Richard Lloyd, for the defendant, that the action was not for the money due upon the note, but for the note itself, the paper, the evidence of the debt. That the note, or the goods, as he called it, was the property of Mr. Finney, who was the real owner, who could not be divested of his property in it, except in the manner in which he might lose it in any other chattel. He denied the holder's (merely as holder) right to the note against the true owner, or that possession gave a right to it.

The counsel for the plaintiff, Mr. Williams, maintained that the holder of a bank note, upon a valuable consideration, has a right to it, even against the true owner. That the circulation of these notes vests a property in the holder, who comes to the possession of it upon a valuable consideration.

We shall now give Lord Mansfield's judgment, with the italics as they stand in 1. Burrows, p. 456.

"After stating the case at large, he declared that at the trial, he had no sort of doubt, but this action was well brought, and *would lie* against the defendant in the present case; upon the *general course of business*, and from the *consequences* to trade and commerce, which would be much incommoded by a contrary determination.

"It has been very ingeniously argued by Sir Richard Lloyd for the defendant. But the whole fallacy of the argument turns upon comparing Bank Notes to what they do not resemble, and what they ought not to be compared to, *viz.* to goods, or to securities, or documents for debts.

"Now they are *not* goods, not securities, nor documents for debts, nor are so esteemed; but are treated as *money*, as *cash*, in the ordinary course and transaction of business, by the general consent of mankind; which gives them the credit and currency of *money*, to *ALL* intents and purposes. They are as much *money*, as guineas themselves are; or any other current coin, that is used in common payments *as money* or *cash*.

"They pass *by a will* which bequeaths all the testator's money or cash; and are *never* considered as *securities* for money, but as *money itself*. Upon Lord Ailesbury's will £900 in Bank Notes was considered as *cash*. On *payment* of them, whenever a receipt is required, the receipts are always given *as for money*; not *as for securities*, or *notes*.

"So on bankruptcies, they cannot be followed as identical and distinguishable from money; but are always considered as *money* or *cash*.

"It is a pity that reporters sometimes catch at quaint expressions that may happen to be dropped at the bar or bench, and mistake their meaning. It has been quaintly said 'that the *reason why* money can not be followed is *BECAUSE* it has *no earmark*,' but this is *NOT* true. The *true* reason is upon account of the *currency* of it, it cannot be recovered after it has passed in *currency*. So in case of money stolen, the true owner cannot recover it, *after* it has been paid away fairly and honestly upon a valuable and *bonâ fide* consideration: but *before* money has passed in currency, an action may be brought for the *money itself*. There was a case in 1. G. 1. at the sittings, *Thomas v. Whip*, before Lord Macclesfield, which was an action upon assumption, by an administrator against the defendant, for money had and received to his use. The defendant was nurse to the intestate during his sickness, and being alone conveyed away the *money*. And Lord Macclesfield held that the action lay. Now this must be esteemed a *finding* at least.

"Apply this to the case of a *Bank Note*. An action may lie against the *finder*, it is true, (and it is not at all denied); but *not after* it has been *PAID AWAY IN CURRENCY*. And this point has been determined even in the infancy of Bank Notes; for 1. Salk. 126. M. 10. W. 3. at *nisi prius*, is in point. And Lord Chief Justice Holt there says it is, 'by *reason of the course of trade*, which creates a property in the assignee or bearer.' (And the 'bearer' is a *more proper* expression than *assignee*.)

"Here an innkeeper took it, *bonâ fide* in his business, from a person who made an appearance of a gentleman. Here is no pretence or suspicion of collusion *with the robber*, for this matter was strictly inquired and examined into at the trial, and is so stated in the case, 'that he took it for a *full and valuable consideration*, in the *usual course of business*.' Indeed if there had been any collusion, or any circumstances of *unfair dealing*, the case had been much otherwise. If it had been a note for £1,000 it might have been suspicious; but this was a *small* note, for £21 10s. only, and *money given in exchange* for it."

Lord Mansfield then commented upon certain of the cases which had been cited, and shewed that they did not apply or were misreported, and continued:

"A Bank Note is constantly and universally, both at home and abroad, treated as money, as cash, and paid and received as cash; and it is necessary for the purposes of commerce that their currency should be established and secured.

"There was a case in the Court of Chancery on some of *Mr. Child's* notes, payable to the person to whom they were given, or bearer. The notes had been lost, or destroyed, many years. *Mr. Child* was ready to pay them to the widow and administratrix of the person to whom they were made payable, upon her giving bond with two responsible sureties (as is the custom in such cases) to indemnify him against the bearer, if the notes should ever be demanded. The administratrix brought a bill; which was dismissed because she either could not, or would not, give the security required. No dispute ought to be made with the bearer of a cash note; in regard to commerce and for the sake of the credit of these notes; though it may be both reasonable and customary, to stay the payment, till inquiry can be made whether the bearer of the note came by it fairly or not."

Judgment was then given for the plaintiff.

41. Now by this decision it was established that Bank Notes resembled money in this respect, that an innocent holder for value might retain them, even though stolen, against the former owner. And this decision has been confirmed by a host of cases since that time. And it is now a well settled principle of English law, that a person taking any instrument of credit *bonâ fide*, and for full value, is entitled to recover on it. Thus, the doctrine which had always been held as regards bills of exchange was by this decision held also to apply to Bank Notes. But further than this, the principle of the decision has been extended to all negotiable instruments; it also applies to bills of lading, and dock warrants; it is well settled by a series of cases that the property represented by bills of lading and dock warrants passes to an innocent holder for value, exactly in the same manner as bills of exchange.

42. Such is the true legal bearing of this case, and we see that it lends no force whatever to the doctrine that bank notes are cash, or currency, to the exclusion of bills of exchange. So far from it, it proves the very reverse, because if the principle of transfer by delivery, is the criterion of currency, the rule was applied to bills of exchange long before it was applied to bank notes. And, if that be the criterion, bills of lading and dock warrants are currency as well, a conclusion which must be rejected. Moreover if Colonel Torrens is willing to accept the judgment of courts of law, as to what is, and what is not money, he must admit that deposits in banks are currency, or money, because it has been several times held in the courts of equity, that a balance at a banker's passes under the word money in a will. Now the sect of economists to which Colonel Torrens belongs, strenuously repudiate the doctrine that deposits in a bank are currency.

43. But though the general principle decided in the case of *MILLER v. RACE* is undoubtedly well settled law, that by no means holds good of all the sweeping assertions attributed to Lord Mansfield in the judgment as reported in Burrows. The assertions attributed to Lord Mansfield are

so extraordinary, that we cannot believe that he has been correctly reported. He himself, in the course of his judgment, as reported, says that Lord Chief Justice Holt must have been misreported in one of the cases cited. And we firmly believe that the same thing has happened in this case. We entirely refuse to believe that he ever could have uttered the extraordinary assertions attributed to him. For he is actually made to say that bank notes are not only like money in some respects, and that they were as readily received as cash, in the course of trade, but he is made to say that they were the same as money to "ALL intents and purposes. That they are as much money as guineas themselves," and that they were "never considered as securities for money, but as money itself." And he is made to adduce several cases in which bank notes were treated as money. But we refuse to believe that so eminent a judge could ever have said that they were the same as money to ALL intents and purposes, or that they were as much money as guineas themselves. For this very manifest reason, a debtor could compel a creditor to receive guineas in payment of a debt, but at the time this judgment was given, no debtor could compel a creditor to receive £1,000,000 of Bank of England notes, in payment of a debt of one sixpence. The money of a country is that which a debtor can compel a creditor to take in discharge of a debt. Guineas were legal tender, but bank notes were not legal tender. The acceptance of them was purely voluntary, like the acceptance of any other instrument of credit whatever. Edmund Burke was a better lawyer than the reporter who attributed such a doctrine to Lord Mansfield. He says in an oft-quoted passage, (*Reflections on the Revolution in France*, Vol. I p. 468-9. Bohn's Edit.) speaking of the French revolutionary assignats; "At present the state of their treasury sinks more and more in cash, and swells more and more in fictitious representation. When so little within or without is now found but paper, the representative not of opulence, but of want, the creature not of credit but of power, they imagine that our flourishing state in England, is owing to that bank paper, and not the bank paper owing to the flourishing condition of our commerce, to the solidity of our credit, and to the total exclusion of power from any part of the transaction. They forget that in England NOT ONE SHILLING OF PAPER MONEY OF ANY DESCRIPTION IS RECEIVED BUT OF CHOICE; that the whole has had its origin in cash actually deposited (in which assertion Burke is mistaken); and that it is convertible at pleasure, in an instant, and without the smallest loss, into cash again. OUR PAPER IS OF VALUE IN COMMERCE, BECAUSE IN LAW IT IS OF NONE. IT IS POWERFUL ON 'CHANGE, BECAUSE IN WESTMINSTER HALL IT IS IMPOTENT. IN PAYMENT OF A DEBT OF TWENTY SHILLINGS, A CREDITOR MAY REFUSE ALL THE PAPER OF THE BANK OF ENGLAND. Nor is there amongst us a single public security, of any quality or nature whatsoever, that is enforced by authority." Nor did the Bank restriction Act of 1797 venture to make Bank Notes legal tender, it only enacted that if a debtor offered them in payment of a debt, he should not be arrested; it did not take away any creditor's right to demand and be paid in coin. But it

enacted that payment of debts in Bank Notes was to be deemed payment in cash, if offered and ACCEPTED as such. Now what was the use of this enactment, if Bank Notes were already as much money as guineas to all intents and purposes? But, in fact, Bank Notes were not declared to be legal tender between persons, until the Bank Charter Act of 1833. Now if they were already identical with guineas, what was the use of this enactment?

44. But Lord Mansfield is further made to say that bank notes were not *securities* for money, but *money itself*. But how could this be when the bank note was a *promise to pay* on the face of it? And every holder of a bank note had a right to demand payment of it in guineas. How was it different in kind from any other promise to pay? No doubt it enjoyed a higher degree of credit than other promissory notes, and probably no one ever doubted that he could get cash for it if he chose, but that did not make it money. It was manifestly on the very face of it a security for money, though one that was never doubted.

45. Thus we see that the arguments for drawing a fundamental distinction between bank notes, payable in cash, and other instruments of credit, so as to make one currency and the other not currency, fail entirely. *And we do not hesitate to affirm THAT IT IS NOT POSSIBLE TO FRAME A DEFINITION OF CURRENCY SO AS TO INCLUDE BANK NOTES CONVERTIBLE INTO CASH ONLY, (and not such as are inconvertible and declared by law to be legal tender), AND TO EXCLUDE OTHER INSTRUMENTS OF CREDIT.*

46. Promissory notes were first introduced into this country by the goldsmiths of London, who issued them in exchange for money deposited with them by their customers, and also in the discount of bills of exchange. They were at first treated exactly as bills of exchange and were passed by indorsement. But it was long before they were recognized by the law merchant. They were first technically called *bills obligatory*, or *bills of credit*, or of *debt*, (*BILL OBLIGATORY*), and it was provided by the Act, Statute 1694, c. 20, s. 29, founding the Bank of England, that its bills obligatory and of credit, i.e., its bank notes, might be assigned and assignable to any person or persons who should voluntarily accept the same, and so by such assignee *toties quoties* by indorsement thereupon; and that such assignment, and assignments, so to be made, should absolutely vest and transfer the right and property in and unto such bill, or bills obligatory, and of credit, and the monies due upon the same; and that the assignee or assignees should and might sue for and maintain an action thereupon in his own name.

This, however, did not extend to the notes of private bankers, which were for some time longer without the pale of the law, and Lord Chief Justice Holt was terribly put out when an action on a promissory note was brought in his court. (*PROMISSORY NOTE*). By the Act, Statute 1704, c. 8, the quality of negotiability, which had been conferred on the notes of the Bank of England, was also conferred on the promissory notes of all other persons, that is, they were made transferable by indorsement. In process of time, however, as a bank note was a promise to pay cash to bearer on demand, and consequently everyone thought that taking the note of a wealthy banker which

might be cashed at a moment's notice, was as good as cash itself, the custom of indorsing bank notes fell into disuse; and, we find in the case of *Miller v. Race* above-mentioned, that it was the acknowledged usage of trade that bank notes were passed by mere delivery from hand to hand without indorsement. But, though from the sense of security entertained, the ceremony of indorsement was dispensed with as superfluous, it must be carefully observed that that in no way altered the character of the instrument, and the receiver of the note did it entirely at his own peril, and ran exactly the same risks as he did if he took any other instrument of credit without indorsement. (*PROMISSORY NOTE*).

47. But though we entirely deny that there is any distinction in kind between bank notes payable in cash, and which are not made legal tender by law, and other instruments of credit, yet they are the most powerful form of credit for good or for evil, and like all other forms of power, while they are capable of being used so as to produce immense benefits, their abuse will produce the direst calamities. Any instrument of credit whatever dispenses with the use of coin in any transaction in which it is used, and bank notes among the rest. We have shewn that it is a general law of the currency that when two species of currency circulate together of the same nominal amount, but of different actual values, the least valuable will drive out and expel the more valuable. From this general law it follows that if bank notes be allowed to be issued of the same denomination as any coin, they will certainly expel that coin from circulation. Experience amply verifies the truth of this law. It has been invariably found in all countries that bank notes drive coin of the same denomination out of circulation. Consequently, instead of the solid universal credit of money, there comes to be substituted the precarious and particular credit of individuals, as the sole circulating medium of a country. A condition of things manifestly fraught with danger. Consequently no bank notes should be permitted to be issued of the same denomination as the standard metallic unit of money. The same remarks are no doubt to a certain extent true of bank notes of a higher denomination. A bank note of £5, or £100, as certainly dispenses with and displaces five sovereigns, or 100 sovereigns, as a £1 note does one sovereign. But then there are not nearly so many transactions in which a £5 note or a £100 note is required, as where a sovereign is required. Consequently if £1 notes are prohibited, the necessities of commerce and trade will compel people to keep a certain amount of specie in the country, and thus the currency in general will be leavened with a sufficiency of metal to enable it to preserve its stability.

48. Bank notes, then, are to be regarded in every point of view as independent entities, and the creation and issue of them has exactly the same effects as the importation of so much money. The immense advantage of them consists in this, that if any great work is to be effected they can be created and issued at once, without delay, and at comparatively no expense, whereas, to obtain an equal amount of metallic money, commodities must first be exported to obtain it. The enormous advance of England in industrial works in

the last quarter of the last century was chiefly effected by means of bank notes, and without bank notes they could never have been effected in so short a space of time. So the prodigious strides made by Scotland during the last century were chiefly due to the formation of powerful banks. And these bank notes, so long as there was real demand for them, were exactly equivalent to so much real additional capital, as we have seen above that Mr. Mill acknowledges.

49. But unfortunately, while the creation of a certain amount of bank notes is a great blessing, the issuers of them deriving so much profit from their manufacture, and, in fact, finding themselves in the possession of so much wealth, without labor, have scarcely ever been able to restrain themselves within due limits. It is quite clear that being independent entities, if the quantity issued exceeds certain limits, like everything else under similar circumstances, their value will diminish, as compared with metallic money. There is no instance in any country in which any persons, public or private, having been entrusted with the power of issuing bank notes, unlimited in amount and denomination, have not abused it, and produced such calamities as to make men almost curse the very power itself. In most countries, therefore, it has been found absolutely necessary to limit the power of issue either, or both, in amount and denomination. In England the Bank of England was limited at first in amount, but not in denomination; it was afterwards unlimited in both. The private bankers were unlimited in both till 1775, and the consequence was, specie was driven out of many parts of the country, where notes circulated for 6d. In that year bank notes, under £5, were suppressed. This restriction being temporarily suspended during the bank restriction act, was productive of enormous calamities to the country from 1810 to 1816, and was again imposed. The Bank of England itself having immensely abused its power of issue, and having brought itself to the very verge of bankruptcy on several occasions, was again put under restraint by the Bank Charter Act of 1844, and all other banks which issued notes at that period were also strictly limited, and all new ones were prohibited. And so it has been found necessary to adopt some measures of limitation in almost all other countries.

50. But the actual amount of the limitation and the method of enforcing it, as well as the criterion of depreciation, have been the subjects of much controversy and difference of opinion. Some writers maintain that bank notes should strictly be limited to the exchange of bullion, that the bullion they are exchanged for should be rigidly kept in the vaults of the bank, so that for every £5 note in circulation there should actually be five sovereigns in the bank. This is what they call the CURRENCY PRINCIPLE. Upon this principle the banks of Venice, Amsterdam, Sweden, Hamburg, and others, have been founded, or professed to be. Thus the credit they created was exactly equal to the bullion they possessed. But these banks never did any discount business at all. IT IS ABSOLUTELY IMPOSSIBLE FOR A BANK, CONSTRUCTED ON THE CURRENCY PRINCIPLE, TO DO DISCOUNT BUSINESS. For it is the very essence of a "bank," to discount bills of exchange by creating credit. It is, there-

fore, impossible to apply the currency principle to the Bank of England without prohibiting it from discounting bills of exchange. In some banks their issues are limited to a certain proportion to the bullion they have in reserve. In the Bank of England the issues are limited to a fixed amount based upon public securities, with an additional amount exactly equal to the quantity of bullion in the bank. In America it is common to require, in addition to the convertibility of the note, that an equal value of some other property, such as public securities, or a mortgage upon land, be deposited with some public office, by all issuers of notes. All these regulations have been devised to check the almost universal tendency Banks entrusted with an unlimited power of issue have had, to endanger their own stability by excessive issues of notes. But although in many cases these restrictions undoubtedly do confer additional security on the notes, they must be considered more as expedients to compel banks to do what they have very seldom had the resolution to do, namely, to raise the rate of discount during a foreign drain of bullion. The neglect of this has been the cause of some of the most severe commercial crises in our history. (DISCOUNT; CRISIS, COMMERCIAL.)

The Life and Writings of William Paterson, founder of the Bank of England. London, 1858. (PATERSON).

BARAS, MARC ANTOINE, was born at Toulouse in 1764, and studied the *belles lettres* and jurisprudence, and became an advocate before that Parliament. He soon abandoned law, however, for Political Economy, which had but few cultivators at that time in France, and he submitted several plans of reform to Condorcet. He also became acquainted with Bailly, and other eminent men. He composed a work *Arithmétique Politique* on a similar plan to that of Arthur Young, which gained him much reputation. He was a partisan of the revolution, and in 1791, being elected as one of the municipal council of Toulouse, he did much to introduce the revolutionary laws there. The Spaniards threatened an invasion, and he was sent to the Convention to urge them to adopt defensive measures. He returned to Toulouse, where he described in indignant language the disgraceful scenes of violence he had witnessed in the capital. He was soon afterwards denounced as a Federalist, sent to Paris and executed along with Hebert, De Vincent, and others, on the 13th April, 1794.

BARBON, NICHOLAS.

A discourse on Trade.

A discourse concerning coining the new money lighter, in answer to Mr. Lock's considerations about raising the value of money. London, 1696.

This is one of the host of pamphlets which appeared during the great monetary crisis of 1696. (COINAGE). It advocates the reduction of the new money to the standard of the degraded coin, which was in circulation, just as many persons, in 1816, would have reduced the new coinage to the standard of the depreciated bank note. Although Barbon's object was to dispute the sound doctrine supported by Locke that the quantity of bullion in the coin was the measure of its value; and to establish the foolish fallacy that it was the name and stamp on the coin which gave it its value, yet this little work contains some remarkable things. He very clearly understood and inculcated the doctrine that *value* was the relation which a thing bore to other things, and he is one of the first that we are aware of, who notices what Adam Smith calls the distinction between *value in use* and *value in exchange*. "There is nothing," he says, p. 6, "that troubles this controversy more than for want of distinguishing between value and virtue.

"Value is only the price of things; that can never be certain, because it must be then, at all times, and in all places, of the same value; therefore nothing can have an intrinsic value.

"But things have an intrinsic virtue in themselves, which in all places have the same virtue; as the loadstone to attract iron, and the several qualities that belong to herbs and drugs, some

purgative, some diuretical, &c. But these things, though they may have great virtues may be of small value, or no price, according to the place where they are plenty or scarce, as the red nettle, though it be of excellent virtue to stop bleeding, yet here it is a weed of no value from its plenty. And so are spices and drugs in their own native soil of no value, but as common shrubs and weeds, but with us of great value, and yet in both places of the same excellent intrinsic virtues." Again, "For things have no value in themselves, it is opinion and fashion brings them into use, and gives them a value." Barbon thus puts his finger on the very thing which is the curse and the bane of Political Economy at this day, the expression, *intrinsic value*, which is confounding an *intrinsic quality* with an *external relation*. (BANK NOTE; VALUE.)

He also well shews that there is no distinction between things of equal value, whether they are perishable or durable. An error on this point long infected Political Economy.

The most remarkable part of the work, however, is the thorough refutation he gives to the fallacy of the balance of trade and the mercantile system. This chapter well deserves to be read, because it is as complete as anything in Adam Smith, or any subsequent writer. Barbon, in the beginning of his work, well shews that the fable of Midas was the best burlesque of the mercantile system. After exposing the absurdity of those who think that gold and silver were the only wealth, he says, "I have insisted longer on this subject than was necessary in this discourse, and the rather because the *Balance of Trade* does so generally perplex all debates concerning trade. And that the notion seems as if it were first invented by some merchants on purpose to mislead men's reasons about trade, because it is commonly used for an argument against any flourishing trade, *That such a trade is not for the benefit of the nation.*" * * *

And though I am of opinion there never was any balance of trade made up, nor can be, by any methods proposed, as I have yet heard of, nor any such uses to be made by it, as is expected if it could be found out, yet because I cannot think that gentlemen may on a sudden alter their opinion by anything I have wrote against a subject so generally believed, I will, therefore, for argument's sake, suppose there is a balance of trade, and that it is, or may be, cast up every year with every nation, yet it will not follow that the balance of the account must be paid in money. For if the balance be paid by value, it is no matter by what sort of goods that value is paid. *For one sort of wares are as good as another if the values be equal.* An hundred pounds worth of lead or iron is as good as an hundred pounds worth of silver or gold." p. 52-3.

He also shews that it is a great mistake to suppose that money only goes out of a country because there are debts to be paid, as so many of the witnesses in 1804 and 1810 maintained. "Money is never carried out of any country when it is coined, except it be to those countries where the bullion bears a higher price than what the money is current at, or where the exchange runs so high to any country, as it will be more profit to the merchant to melt down the money and send it over in bullion than by bills of exchange. And in both these cases it may often fall out that

the money may be sent over to a country, and yet no debt contracted in that country. And there the *balancing the account* cannot be the reason of drawing money out of a nation.

"For though Spain were not indebted to any nation, yet the gold and silver would be brought away. For being more plentiful there than in any part of Europe, because of the West Indies that belong to them, is consequently there of lower value. And being their chief staple commodity, having little other goods of value, if they will trade with other nations, and have their commodities, they must give their bullion in exchange, though their laws are capital that prohibit it. And yet every time they traffic with other nations there may be no debts left on either side." Among the inferences he draws is, "That no sort of commodities ought to be totally prohibited, and that the freer the trade is the better the nation will thrive."

Barbon thus has the merit of being one of the first to expose the fallacy of the balance of trade, though his work does not seem to have produced much effect, and it was reserved for Quesnay and the economists of France, to make the first impression on public opinion. He also saw with great clearness the fundamental fallacy which to this day infects Political Economy. But when he comes to discuss the principal object of his work his sagacity seems entirely to desert him, and it is nothing but an elaborate attempt to prove that the quantity of bullion in a coin does not affect its value, which he alleges is derived solely from the name and the stamp. If it had not been for this most unfortunate absurdity, this would have been one of the most excellent works before Adam Smith.

Industrial Exchanges, with a consideration of taxation. New York, 1849.

BARING, ALEXANDER. LORD ASHBURTON, An eminent merchant, second son of Sir Francis Baring, (see following notice) was born 27 October, 1774. He was sent to America and Canada, and managed that department of the business of the great house of Baring. In 1798, he married the daughter of William Bingham, Esq., a Senator of the United States. In 1810, on the death of his father, he became the head of the house of Baring Brothers. He was elected M.P., for Taunton in 1812, and for Callington in 1820, which he represented till it was disfranchised by the Reform Act. Up to this time he had belonged to the Whig party, but he opposed the Reform Bill, and then joined Sir Robert Peel. In 1834, that minister appointed him President of the Board of Trade, and Master of the Mint, and before his retirement from office in April 1835, created him a peer. Mr. Baring chose the title of Lord Ashburton, his aunt having married the famous John Dunning, who was created Lord Ashburton in 1782, and whose son died without

issue in 1823. The relations between Great Britain and America having assumed a threatening aspect in consequence of disputes about the unsettled boundary between Maine and Nova Scotia, Lord Ashburton was sent out by Sir Robert Peel as a special commissioner to settle the matter, which he succeeded in doing, though it is unfortunately true that he was over-reached by the American commissioner, who wilfully suppressed authorities which were in favor of British rights. Although Lord Ashburton was an adherent of Sir Robert Peel, he opposed the Bank Charter Act in 1844, and the repeal of the corn laws in 1846. He was a great patron of the arts, and a Trustee of the National Gallery and British Museum. He was a member of most of the Committees on Banking in the House of Commons while he sat in it. He died in 1848.

The causes and consequences of the orders in council with America. London 1808.

The commercial and financial crisis considered. London 1847.

This pamphlet was written to shew that the Bank Charter Act of 1844, was unsuitable and productive of mischief in such a crisis as that of 1847.

"It is singular that in proportion to the abstruse nature and inherent difficulties of a subject, men are apt to be positive and dogmatical in their theories, undaunted by adverse experience, and repeated disappointments. The various schemes for regulating the action of Banks have been propounded with unhesitating confidence, and pronounced to be unfailing although every real trial of this great practical problem proves that it still remains to be solved, and even the, to me, unintelligible theories of the Birmingham school of philosophers are still maintained with perseverance by persons of great ability, who seem unconscious that beyond the circle of their own town, the whole world is against them. The last notable settlement of this endless controversy was by the Bank Charter Bill of 1844, and the great leaders on both sides of the House of Commons are resolved to defend it, in spite of the unfortunate fact that, on the first occurrence of what is called a crisis, the failure is apparent, in the evidence of a state of embarrassment never exceeded. Mere speculative reasoners defend their theories with sufficient obstinacy, but men who are, who have been, or who expect to be, ministers of state, cannot so easily afford to be in the wrong or to confess themselves to be not infallible. It is therefore stoutly maintained in the House of Commons by the leaders of both parties, and their numerous partisans, that look about as you may for the cause of our difficulty, the last Charter of the Bank, with its whimsical restrictions and provisions, was an act of absolute wisdom. * * *

"Now, my object in appearing before the public is to endeavour to maintain, with as few words as the case may admit, the opinion I gave when the Charter Act was before the House of Lords, that the expectations entertained of this infallible panacea were unfounded—that it would only work in fair weather, when restrictions of all sorts are inoperative and immaterial,—that it could not fail to break down under the first difficulty, and that it is in fact a serious aggrava-

tion, if not indeed the actual cause of the distress we now experience!"

He then alludes to the crisis of 1825, which was very similar to that of 1847, and ridicules the division of the Bank into two departments. "If it were necessary to limit their circulating notes, it might have been done in a direct and simple form, but I shall endeavour to shew that any rigid limitation by law of a positive amount of issue of paper to bearer, having the character of currency, at all times and under all circumstances, is inconsistent with the duties and usefulness of a bank." He then states the theory of the framers of the Act of 1844, and describes the crisis of 1825. In that crisis the credit of the Bank was good, no one refused its paper, and the state of the foreign exchanges was favourable, so as to render it impossible to export gold. He was sent for by the ministry to consult with them and the governor of the Bank, as to what should be done in this crisis. They unanimously agreed that, considering the state of things as described, *an increase of accommodation was the true remedy*, which was accordingly done, and proved quite satisfactory. "It is hardly necessary that I should guard myself from being supposed to maintain that an increased issue of paper is an invariable remedy against a drain of specie, but what I do maintain is that it was the fit remedy for that particular case, and that it was undeniably proved to be so by the result, while a contrary treatment might have suited a drain caused by adverse exchanges. But the Act of 1844 says, that all cases of drain shall be treated in the same manner; that there shall be no discretion or judgment allowed as to causes, and my reason for dwelling so long on the case of 1825-6 is to substitute for speculative reasoning a clear proof that the Act of 1844, not only would not have suited that case, but would have aggravated all the difficulties; that it consequently is not of universal application, and therefore cannot without danger be suffered to govern indiscriminately our circulation. I think I might stop here, and hold that I had proved enough by positive facts and results, and not by mere brain-spinning, the fallacies upon which this Act is founded. *Its machinery does not suit the case of pressure on the Bank from domestic distrust and panic, and these must always be a large and formidable portion of our monetary visitations.*"

He then treats of the word "currency." "If the Birmingham philosophers are puzzled by the question so often put to them, to define what they mean by a pound sterling, when their paper is clothed in its irredeemable character, sounder reasoners appear to have equally failed in any precise definition of the word *currency*. The Act of 1844, treats it simply as bank notes to bearer, but they who observed critically and carefully all the varied mazes of our monied transactions, must recognize an almost endless variety of objects, acting more or less directly, and with more or less celerity, the same part—bills of exchange at long or short dates—exchequer bills—India and railroad bonds—deposits on demand with the great money brokers—latterly, post office orders for small sums passing from town to town, of which useful description of quasi-currency, the public will probably be surprised to learn that

little short of £6,000,000 were circulated last year. But above all, deposits both with the Bank of England and private bankers, are a most essential part of this currency; though they do not appear in the tangible shape of pieces of paper passing from hand, they are, in fact, the most formidable means of commanding the treasures of the Bank, though they seem to be wholly overlooked by our exclusive guardians of the currency. The theorist sees in circulation nothing but the bank note, but the practical man engaged in large operations knows how many millions pass through his hands without his seeing or touching a bank note, and how many varied securities and engagements perform the essential duties of his circulation."

Lord Ashburton then goes on to shew that this Act is unsuitable to be made an inflexible rule to govern the circulation in all cases, but that different species of pressure require different modes of treatment. An opinion which is further confirmed by the crisis of 1857.

BARING, SIR FRANCIS.—An eminent merchant of London, born 18th April, 1740, was the third son of John Baring, Esq., of Larkbeer, Devonshire, who was of German extraction. He was created a Baronet in 1793, and died in 1810. His sister Elizabeth, married the famous John Dunning, the first Lord Ashburton. Sir Francis was one of the witnesses examined before the Bullion Committee. He published the following pamphlets:—

Observations on the establishment of the Bank of England, and on the paper circulation of the country. London, 1797.

This pamphlet, as containing the opinions of an eminent merchant is entitled to our notice. It moreover contains some details of interest. The panic of 1793 began with the banks at Newcastle, which the writer attributes to their issuing notes, which allowed interest to commence some months after date, and were then payable on demand. The partners were wealthy, but their funds were invested, and when the run came they had no time to prepare to meet it. The banks in the west of England, on the contrary, stood their ground, though not so wealthy as those of the north, because they issued notes payable at twenty days after sight, with interest to commence from the date of the note, and cease at acceptance. The writer, therefore, wished a law to pass, to prevent country banks issuing notes payable on demand. Sir F. Baring then describes the circumstances of the panic of 1793, (*CRISIS, COMMERCIAL*), and the policy of the directors of the bank. He makes some observations on the course the directors should follow in a crisis. "For the present purpose it may be sufficient to confine the considerations, as to the cause of the demand for guineas to three heads.

"First, as a medium of remittance to foreign parts, to supply the want of bills of exchange.

"Second, for the purpose of hoarding in the country, from a want of confidence in the government, and in the circulating paper.

"Third, to enable country banks to discharge their demands whilst confidence in the government, and in the Bank of England, remained entire and perfect.

"The first is the most dangerous, as being the

most injurious to the country; every measure ought to be taken to palliate or prevent it, prohibition or bankruptcy excepted; but it is inevitable, if we shall continue from a long time to have more to pay to foreigners than we receive from them, or, in other words, if the Balance of Trade is against us.

"The second is the only circumstance which can, in any measure, justify the late bankruptcy.

"The third ought to be viewed, not with perfect indifference, but with a disposition on the part of the Bank to supply almost their last guinea; as they cannot be sent abroad but must return again to their own coffers, as proved to be the case in the year 1793."

It was notorious at the time that large quantities of gold and silver were received from France; of course none could be sent thither.

Sir. F. Baring approved on the whole of the Bank restriction Act, seeing the constant danger of a run on the Bank from fears of invasion, and he was also of opinion that bank notes should have been made legal tender during the war. "A change even from good to better ought not to be made until there is almost a certainty of maintaining and preserving it in that position, for a retrograde motion in public credit is productive of consequences which are incalculable. With this principle in view, I am adverse to the Bank reassuming their payments generally during the war, whilst there is a possibility of their being obliged to suspend them again." He thought that such a course would promote confidence and increase the security of their notes. "But as the directors are men, and, of course, fallible, it will be dangerous in the extreme to trust them with such power, without some efficient check and control. They may, for the advantage of the proprietors, increase their circulating power without bounds. Or they may, under the influence of the minister, enter into loans or engagements beyond what the general security and safety can justify. These objects can only be attained by limiting the amount to which the company shall be permitted to issue their notes; and which, as observed before, ought not much to exceed the amount of what is at present in circulation." The author's prognostications were fully verified some years later by the extravagant issues of the Bank of England and country banks, which, in 1810, at length caused the appointment of the Bullion Committee.

Further observations on the establishment of the Bank of England and on the paper circulation of the country. London, 1797.

BARNARD, SIR JOHN.—An eminent merchant of London, was born at Reading in 1685. His parents were Quakers, but he joined the Church of England at the age of 19. He entered his father's counting-house at 15, who was a wine merchant, and in 1721 he was deputed by the wine merchants to oppose before Parliament, a bill which they considered would injuriously affect their interests. The reputation which he gained on this occasion procured him to be returned as Member for the city in the following year, which he represented for 36 years. He was always considered a high financial and commercial authority in Parliament, and was opposed to Sir Robert Walpole. He was knight-

ed in 1732, and chosen Lord Mayor in 1737. On the 17th September, 1745, the Chevalier captured Edinburgh, and as soon as the news of this reached London, a run began upon the Bank of England, and its notes fell to a discount of 10 per cent., and its credit seemed to be in danger of being destroyed. In this emergency Sir John Barnard called a meeting of the merchants at Garraway's Coffee-house, and 1600 signed a paper pledging themselves to support the credit of the Bank, which produced such a good effect, that the notes recovered from their depreciation and the run ceased. The merchants erected a statue to him in the Royal Exchange, during his life. It was destroyed by the fire in 1838. He retired from public life in 1758, and died 29th August, 1764.

Reasons for the representatives of the people of Great Britain, to take advantage of the present rate of Interest for the more speedy lessening of the national debt. London, 1707.

A defence of several proposals for raising of three millions for the service of Government for the year 1746. London, 1746.

A letter to a Member of Parliament occasioned by the rejecting of a scheme for raising three millions, &c. London, 1746.

Some thoughts on the scarcity of silver coin, with a proposal for remedy thereof. London, 1756.

BARRAU, PIER BERNARD.—A French economist, born at Toulouse in 1767. He was appointed to a place in the War Office in 1793, but having married a rich wife, he soon gave it up. Reflecting on the number of well established fortunes which had been destroyed by unforeseen disasters he was led to consider the principles of assurance, and established in the South of France the first Mutual Assurance Society. He died in 1843.

Projet d'assurances pour les récoltes en grain et vins, contre les ravages de la grêle. Toulouse, 1801.

Projet d'assurances réciproques pour les maisons contre l'incendie. Toulouse, 1803.

L'ensemencement et la culture rendus plus simples, plus économiques, et plus productifs, au moyen du semoir et du sarcloir-Barrau. Paris, 1833.

Traité des fléaux et des cas fortuits; ou Manuel de propriétaire de toutes les classes. Paris, 1816.

BARRE, CHARLES.—Advocate at Paris. *Du crédit et des Banques hypothécaires.* Paris, 1849.

BARRELLAS, ESTEVAN.

Semanario curioso historico, erudito, commercial, publico, y economico. Barcelona, 1750.

BARREME, FRANÇOIS.—A French arithmetician, born at Lyons about the middle of the 17th century. He settled at Paris, and gave lectures there. Being warmly patronized by Colbert, his lectures became very fashionable, and his name became proverbial in France, like that of Cocker with us. He died at Paris in 1703.

Comptes faites du grand commerce. Paris 1670. Best edition, 1708.

L'Arithmétique, ou le livre facile pour apprendre l'arithmétique soi même. Paris, 1677.

Le livre nécessaire pour tous les comptables. Paris, 1694, and 1704.

Observations on the circumstances which influence the condition of the labouring classes of society. London, 1817.

An enquiry into the causes of the progressive depreciation of agricultural labor in modern times. London, 1820.

An enquiry into the expediency of the existing restrictions on the importation of foreign corn, with observations on the present social and political prospects of Great Britain. London, 1833.

BASTERECHE, LEON.—A Director of the banque of France. Born at Bayonne, died in 1802.

Essai sur les monnaies. Paris, 1801.

BASTIAT, FREDERIC.—Of all the losses which Political Economy has ever had to deplore, few, if any, are to be compared to that of Frederic Bastiat. Other great economists have run their full career, and have probably given to the world all that could be expected of them, but Bastiat was cut off in the full maturity of his powers, after a brief but immortal career of only six years, just when the fruits of his long meditation, combined with such clearness of perception, power of exposition, vivacity of style, keenness of irony, and irresistible wit, as had never before been brought to bear on the subject, had begun to develop themselves. But it is not in these alone that Bastiat's merit consists. It consists in this, that he

was one of the great founders of what we call the **THIRD ERA** of Political Economy—the school of Aristotle, Bailey, Whately, and Chevalier.

Bastiat was the son of a merchant of Bayonne, and was born there on the 25th of June, 1801. He was left an orphan at the age of nine, and the care of his education devolved upon his grandfather, who had a small estate at Mugron, in the centre of the department of the Landes. He was sent to the College of St. Sever, and afterwards to that at Sorreze, and brought up with a view to enter his uncle's house of business at Bayonne, which he did in his nineteenth year. At first he thought that the business of a merchant was purely mechanical, and could be picked up in a few months. But he was very soon disabused, and found that the science of commerce was not mere routine, and that a merchant, besides his goods and his ledgers, ought to study the laws of Political Economy.

The love of study, however, drew him away from commerce. Possessed of sufficient means to satisfy his modest desires, he left his uncle's counting-house after some years, and, in 1825, on his grandfather's death, retired to his property at Mugron. He tried agriculture, but did not succeed. He studied Adam Smith, J. B. Say, for whom at that time he had a great admiration, Charles Comte, Dunoyer, and the Basque, or Escualdan language. He also studied deeply English and Italian literature. During the following years he devoted himself to philosophy and religion. His excessively retired habits at this time exercised a very unfavorable influence upon his health and spirits, and he so weakened his mind by plunging too deeply into philosophical and religious controversy that, for some time, he was in danger of sinking into a mere devotee.

But he was at length happily persuaded to come more into the world, from which he found a decided benefit. His ideas on the subject of wealth underwent a change. Casting off the juvenile folly of despising money, he came to see that, in modern times, money is often nothing but the fruit of honorable industry, and the reward of benefits conferred upon our fellow men, and henceforth he came to have a more rational view of it.

Thus, for several years his life passed away in peaceful meditation, deep study, and earnest preparation for the brilliant fruit that was to come. It does not appear that he thought of publishing anything till 1829, when he prepared a treatise on the Prohibitive System, but it never saw the light.

In 1831, he was appointed to the office of *juge de paix* at Mugron, and soon after, he was elected a member of the *Conseil Général* of the department, and for the next nine years he followed the same uneventful life. In 1840, he went to Madrid to assist in founding an Insurance Company, and he gives an amusing account of the Spanish character. Having some family business in Lisbon, he went on there, and from thence to Southampton by the English steamer. At this time he had no knowledge of the existence of the Anti-corn-law league. He returned to Paris in January, 1841.

Bastiat had written a few minor articles, shewing great ability, and containing many of the ideas he afterwards developed with such sur-

passing brilliancy, which appeared in the provincial journals. He also addressed some memoirs to the Scientific Society of the Landes, upon the state of the vine cultivation, and the local taxation; but these, of course, did not attract much general attention. It was in July, 1844, that he sent his first article to the *Journal des Economistes*, which first announced to the world that a great economical writer had arisen.

This article upon the influence of the English and French tariffs upon the future of the nations, coming from an unknown name, in the depths of a remote province, at first attracted no attention, and seems to have been destined for the editor's waste-paper basket, when it happened to attract the notice of M. Dussard, who immediately saw its merits. It was inserted in the number for October, 1844, and created an immense sensation, and further contributions were eagerly requested. He then contributed to its columns a series of articles exposing the fallacies of the protectionist system, which were afterwards reprinted, and form part of his *Sophismes Economiques*.

The Anti-corn-law league had been for several years carrying on a vigorous crusade against the corn laws, but so little were the people of either country then acquainted with each other's proceedings, that its existence was almost unknown in France. Bastiat by accident subscribed to the *Globe* newspaper, and thus discovered its existence, and watched its career with the strongest interest, and soon conceived the idea of forming a similar one in France. He entered into correspondence with the chiefs of the league, who sent him papers connected with it. Bastiat then commenced to write in the Bayonne and Bordeaux papers, to try to draw public attention to it. He then tried to organize an association at Bordeaux for the freedom of trade, but this failed at the time, chiefly from want of funds. He then thought of a daily paper in Paris, but the same obstacle prevented its establishment. An opportunity opened to him of being elected a deputy, but for the time he declined.

Seeing the impossibility of organizing a French free trade league at that time, he thought that the next best thing to do, was to translate and set before the public of France the history and proceedings of the English league. He completed a volume containing a brief history of the League, with translations of the principal speeches of the leaders, by April, 1845, and entitled it, *Cobden et la Ligue, ou l'agitation Anglaise pour la liberte des échanges*.

The publication of this work which had been undertaken by Messrs. Guillaumin & Co., brought him to Paris in May, 1845, when he was received with the greatest cordiality by the leading economists of the capital. His brilliant articles—the *Sophismes*—attracted great admiration, and soon produced a perceptible effect in the provinces, and on the circulation of the *Journal*.

In June, 1845, he determined to go to England, and make the personal acquaintance of the chief Members of the League. At this time his reputation had increased so much that he was offered the editorship of the *Journal*. This position would have given him enormous advantages, but it would have required him to leave his country seat and his friends, which at that time he was not prepared to do. In July, 1845,

he came to London, with his book, and visited Manchester.

He returned to Mugron in October. By this time the French press found themselves at last obliged to notice Bastiat's book on the League. It made a great sensation both in Paris, and the Provinces, especially in the South. A numerous party wished to place Bastiat in the Chamber of Deputies, but he still continued to prefer a private position, as it was too early to form a party. Bastiat says that at this time there was not a single Member of either Chamber who dared to avow free trade opinions, or who understood their bearing, or who could support them against the sophisms of monopoly. And this too in the country where J. B. Say and others had lectured with great success, and popularity! We can, therefore, well appreciate the necessity of such a blaze of light, as his *Sophismes Economiques*, in the midst of such Cimmerian darkness. But the French mind was now really awakened on the subject, and in February, 1846, a movement was organized at Bordeaux. On the 23rd, M. Dufour-Dubergie, the Mayor, was elected President of the Bordeaux Free Trade Association.

Bastiat's book had extraordinary success at Bordeaux, where it soon created a veritable enthusiasm, and it became quite the fashion to join the league. The success of the movement was so great as to alarm Bastiat, who wished to restrict it to persons who were really convinced, as he foresaw that when the time came for it to take action, and present a petition to the chambers, their differences of opinion would break out. The greatest enthusiasm spread through France, and Bastiat saw that it would be best to transfer the seat of the movement to Paris, as the Parisian press had ten times the influence of the Provincial. He now removed to Paris, and in a short time the *Société des Economistes* was organized, with the Duc d'Harcourt as President, and joined by all the leading economists. Numbers of peers, deputies, and merchants hastened to subscribe to the new Society. Marseilles, Lyons, Havre, and Nantes followed the example. Five papers at Paris, three at Bordeaux, two at Marseilles, one at Havre, and two at Bayonne, adopted the cause. The *Société des Economistes* started a paper called the *Libre Echange*, of which Bastiat was appointed Editor. But, notwithstanding this enthusiasm on the surface, the real progress of the association was slow and disheartening. Bastiat complains that he could not find two men who were real economists. The authorization necessary to constitute a society was delayed by government, and the French people were so unaccustomed to meetings, associations, subscriptions, and common action, that Bastiat almost gave it up in despair, and thought of returning to Mugron, and confining himself to writing in the papers. Moreover, the progress that his views were making in public opinion, aroused the alarm of the Protectionist party, and it was generally believed that the spread of free trade opinions was some deep Machiavellian plot of *Perfidie Albion* to ruin France, and it was said that Bastiat and his friends were sold to the League.

The triumphant success of free trade principles by the repeal of the corn laws in 1846, gave the corresponding move in France, an additional

stimulus. The protectionists also, now thoroughly alarmed, formed counter-associations, and threatened the government, and tried to arouse the working classes. Bastiat and his friends were denounced as the agents of Pitt and Coburg, those terrible bugbears of French imagination, and so great was the public fury, that his name could not be mentioned in his own village of Mugron.

The government was somewhat alarmed at first at the movement, which resembled in many respects the public ferment before 1789, but they soon saw that the free traders would form a counterpoise to the protectionist party, and M. Duchatel, the Minister of the Interior, privately encouraged one of the members of the Bordeaux association, saying, *soyez fortes, et nous vous soutiendrons*. The protectionists unceasingly denounced them as emissaries of *perfidie Albion*, an imputation which almost overwhelmed them. Bastiat testifies to the profound hatred of England rooted in the minds of the French.

In 1847 Bastiat writes that, after all, the greatest danger and obstacle he had to encounter was Socialism, which had come to the aid of Protection, and had adopted all its fallacies. The principal danger was that the Socialists had attracted a very considerable portion of the rising talent of the country by their specious fallacies; by loudly proclaiming the undoubted evils and misery which existed, and maintaining that their system provided a remedy for them. Thus enlisting the best feelings of humanity on their side, and exciting the imagination of youth by visionary dreams of a social paradise, where some new grand organization of Society was to be effected.

Bastiat saw that the chief danger to his system lay with the youth of the country, and that the best chance of success was in enlisting them on his side. He determined, therefore, to address a course of lectures to the pupils of the schools of Justice and Medicine. They heard him with respect and temper, but without altogether comprehending him. He gave each of them a copy of his *Sophismes*, and then planned out his *Harmonies Economiques*, the former being the *destructive* or *negative* side, and the latter the *constructive* or *positive* side of his system.

Bastiat says that his difficulty was that the democracy of France was protectionist to the core, and filled with hatred of England, and, of course, doubly prejudiced against any doctrines that came from that quarter.

Towards the end of 1847, Bastiat spoke at several of the provincial towns, and was received with much favor.

In the beginning of 1848, the enthusiasm created on the subject of free trade had begun to wane. The increased political struggles distracted the attention of the public from this matter, and Bastiat's health, which had always been feeble, compelled him to resign the editorship of the *Libre Echange*.

The events of February, 1848, brought new enemies into the field. For ten years socialist doctrines had been spreading widely through the working classes, who were firmly convinced that the State was bound to find food, work, and education for every one. The Provisional Government adopted this doctrine. Bastiat felt himself called upon to combat it, and resolved to seek

election to the National Assembly. All the people in the provinces of France were to be sacrificed to the populace of Paris, for while all France was to be taxed to support them, no one thought of supporting the farmers, the laborers, and the artisans of the provinces.

Feeble and suffering as he was, and compelled as he had been to resign the editorship of the *Libre Echange*, when this new danger menaced the State, Bastiat felt himself called upon to face it, and besides the duties of a member of the Assembly, he assumed the editorship of the *République Française*, and combated the socialists in the *Journal des Economistes*, and in a number of little pamphlets, which became very popular, and are mentioned below.

Bastiat was not endowed by nature with the gifts of an orator, and hence he was not able to make much impression on the Assembly from the tribune. But he was appointed to the Committee of Finance, and elected Vice-President of it. He endeavored to devise a general scheme of taxation to mitigate the excessive weight with which it fell on articles consumed by the laboring classes, but it was too daring, vast, and comprehensive, to suit the capacity of such a promiscuous mob as the Legislative Assembly.

Up to this time the works which Bastiat had published were chiefly polemical, and though, of course, they were full of the most profound truths, and inimitable in their line, no controversial works can be expected to survive the errors they expose.

Bastiat had long been meditating a *constructive* work, to shew the connection between the moral sciences and Political Economy, which he proposed to call *Harmonies Sociales*. He hoped by this to enlist on the side of Political Economy the rising talent which was inclined to join the socialist ranks. In the autumn of 1848, this desire grew stronger than ever. The last controversial work he put forth was a series of letters, in which he combated the socialist doctrine of the abolition of interest. At the beginning of 1850, the first volume of his *Harmonies Economiques*, which he considered as the crowning work of his life, was published. But the fearful exertions of the two preceding years had told with fatal effect upon his sickly body, and he felt an internal consciousness that the end of his race was approaching. All he ventured to hope for now was a single year of life to finish the second volume of his *Harmonies*. But his darling wish was not destined to be accomplished.

During the summer of 1850, the enormous labor he imposed upon himself greatly increased his malady, which now fixed itself on his throat, and he completely lost his voice. His physicians enjoined on him perfect rest and silence, and ordered him to spend the winter at Pisa.

The illustrious invalid reached Pisa in September, 1850, and soon proceeded on to Florence, and Rome. But it was too late. He himself felt that his race was run. His friend, M. Paillottet, arrived at Rome to cheer the last moments of the dying philosopher, and he has published an affecting narrative of the last few days of his life. Bastiat died on the 24th December, 1850.

Bastiat's separate works have been collected in six volumes, and published in two forms, 8vo.,

and 12mo. They are not quite arranged in chronological order. We shall notice them as they appear in this edition, stating also the form and manner in which they were originally published, and giving some of the most remarkable extracts from them. Vol. I. contains some of his correspondence, as well as

Aux électeurs du département des Landes. 1830.
Réflexions sur les pétitions de Bordeaux, de Havre, et Lyon, concernant les Douanes. 1834.

Le fisc et la vigne. 1841.

Mémoire présenté à la Société d'Agriculture, Commerce, Arts, et Sciences, du département des Landes, sur la question vinicole. 1843.

De la répartition de la contribution financière, dans le département des Landes. 1844.

These writings addressed to the provincial papers, and composed before his appearance before the public of the capital, contain many of the opinions and conceptions which Bastiat afterwards developed with such brilliancy in his subsequent writings.

De l'influence des Tarifs Français et Anglais sur l'avenir des deux peuples. In the *Journal des Economistes*. October, 1844.

This was the article which created such a sensation on its appearance, and established Bastiat's reputation in the capital. It is a masterly exposition of the progress of Free Trade in England, and of the errors of the prohibitive system, which was daily becoming more rigorous in France.

De l'avenir du commerce des vins entre la France et la grande Bretagne. In the *Journal des Economistes*. August, 1845.

An appeal in favor of the reduction of the enormous duties on French wines in England.

Une des questions soumises aux conseils généraux de l'agriculture, des manufactures, et du commerce. In the *Journal des Economistes*. December, 1845.

In 1845, M. Cunin Gridaine, minister of commerce, addressed some questions to the *conseils généraux* on certain proposed modifications of the law. One of them referred to the importation of iron. This paper of Bastiat's was written upon this subject.

Un économiste à M. De Lamartine, l'occasion de son écrit intitulé, Du droit au travail. In the *Journal des Economistes*. February, 1845.

An earnest remonstrance to the brilliant romancer, against the socialist doctrines which he had adopted.

Sur l'ouvrage de M. Dunoyer de la liberté du travail. 1845.

Sur l'éloge de M. Charles Comte par M. Mignet, in the Libre Echange. July, 1847.

De la répartition des richesses, par M. Vidal. In the *Journal des Economistes*. June, 1846.

Seconde lettre à M. De Lamartine. In the *Journal des Economistes*. October, 1846.

A MM. les électeurs de l'arrondissement de Saint Sever. 1846.

De la réforme parlementaire. 1846.

Vol. II. *Le Libre Echange.*

This volume is composed almost entirely of extracts from the paper *Le Libre Echange* which Bastiat edited for the *Société des Economistes*, and of speeches delivered in Paris and the provinces during 1846, 1847, 1848. As these articles contain the doctrines of his subsequent writings, we shall defer a notice of their salient

points until we come to his more elaborate one.

Vol. III. *Cobden et la Ligue, ou l'agitation Anglaise pour la liberté des échanges.*

This volume consists of translations of the speeches of the principal Members of the Anti-Corn-Law league, with extracts from the newspapers detailing the proceedings of the League in different towns. Bastiat failing at first to organize a similar free trade league in France, undertook this work to popularize the doings of the English league in France. It had great success, and was the first thing that made the general French public acquainted with the existence of the league. It is preceded by an introduction explaining the nature of the contest. This introduction is by far the weakest and most ineffective of Bastiat's writings, in our opinion. It would be easy to shew, if it were worth while, that it contains a considerable amount of unfair argument, but as it does not involve economical principles, we must pass it over, with a simple protest.

It is upon the last three volumes of this collection that Bastiat's reputation with posterity will rest.

Vol. IV. contains.

Sophismes Economiques. When Bastiat began to write, France was entirely imbued with Protectionist ideas. Beyond the walls of the Institute, there was scarcely a single person who either knew, or cared anything about Political Economy, or had any real knowledge of the doctrines of Free Trade. Bastiat thought that the best way of making an impression on the public mind, was to make a series of attacks on the principal fallacies of protection, so as to popularize the subject, and induce people to examine the subject point by point. This he did in a series of brilliant articles published chiefly in the *Journal des Economistes*, and the *Libre Echange*. These articles were collected and published in two series, the first in 1845, and the second in 1848. His premature death prevented the publication of a third series, for which materials were collected. We shall shortly indicate the subjects of the principal essays.

First Series. 1. Abondance, Disette. This shews that the natural result of the Protectionist theory is to produce a scarcity of everything. If man lived by himself, and worked for himself, and did not exchange, the scarcity theory would never have been heard of. He would then have perfectly seen that abundance was the best for him, whether it resulted from his own labor, from ingenious tools, or machinery, or from the fertility of the earth, or from some mysterious invasion which the waves might bring from abroad. Such a man, if he lived alone, would never think of destroying the instruments, which saved his toil, or of diminishing the fertility of the earth, in order to secure reward for his labor. He would clearly understand that labor is not an end but a means, and that a saving of labor was progress. But the notion of exchange obscures so plain a truth. Exchange creates two opposite interests in regard to each object—that of the Producer, and that of the Consumer, and each of them is apt to consider his own labor as an end, and not as a means. Each producer naturally wishes his own production to be as dear and

scarce, and the price to be as high as possible. Thus producers are always interested against the general well being, and if their wishes could be gratified, the world would rapidly retrograde to barbarism. The sail would proscribe steam, the oar would proscribe the sail, the oar in time would yield to carriage transport, and that to the mule, and that lastly to the pack, and so on of other products. On the contrary, the interest of the consumer is always to have abundance and cheapness, and consequently it is most in harmony with the general well being, which is manifestly more promoted by there being more of everything, more corn, more cattle, more cloth, more iron, more coal, more sugar, &c. than less of everything. The theory of abundance therefore is the consumer's interest.

II. *Obstacle, cause.* This follows up some of the ideas started in the preceding essay. Man in his natural state possesses nothing. Between this and the attainment of his desires, obstacles intervene, which it is the object of labor to surmount. It is clear, however, that he would be better off, if those obstacles did not exist. In a state of isolation, each must overcome these obstacles for himself, and it is clear the less these obstacles exist the better for him. In a state of society he does not attack all these obstacles by himself, but others do it for him, and he in return surmounts some of the obstacles which others are surrounded with.

It is quite clear, however, that for society in the mass, it is better as these obstacles are fewer and feebler.

But in modern society, from the division of labor, each one is occupied in combatting one species of obstacle, for the benefit of himself and his neighbours.

Each one, therefore, individually sees the immediate cause of his wealth in the obstacle which it is his profession to combat for society. The stronger and more powerfully it is felt, and the higher his neighbours will reward him for combating it, the more wealthy he becomes, and this happens to each producer in turn. Each profession, therefore, has a direct interest in the continuation and increase of the obstacle, which it is their special province to overcome.

Thus theorists, who found a system on the sentiments of individuals, say that a want is wealth, that labor is wealth, an obstacle to well-being is wellbeing, and that to multiply obstacles is the way to support industry, and increase national wealth. Thus, in process of time, the gross fallacy springs up that human labor is not a means, but an end. This, however, is an egregious fallacy. If one obstacle is overcome, there are always others to vanquish, and thus, if labor is saved, two obstacles may be overcome with the same amount of labor that one was before.

III. *Effort, résultat.* The doctrine of obstacles is further considered and pursued to its absurd consequences. Between our desires and their gratification, obstacles are interposed, which we must overcome by the exercise of our faculties, and in a general way industry may be said to be an effort followed by a result. But how is our wealth to be measured? By the result of the effort, or by the effort itself? A relation exists between the effort and the result. Does progress consist in the increase of the first, or the second

term of this ratio? In Political Economy, these two doctrines divide the domain of opinion.

According to the first system, wealth is the result of labor, and it increases according as the result is greater than the effort. Its perfection, whose type is the work of Providence, consists in an infinite distance between the two terms, viz., effort nothing, result infinite.

The second regards the effort itself as that which constitutes and measures wealth. To advance is to increase the relation of labor to the result. Its extreme is found in the eternal and sterile labor of Sisyphus.

The first naturally encourages everything which diminishes labor, and augments produce, such as powerful machinery to aid the force of man, trade, experience, competition.

The second supports everything that tends to increase labor, and diminish produce, privileges, monopolies, restrictions, prevention of machinery, &c.

The universal practice of man always follows the first system. There is no laborer of any sort, either agriculturist, manufacturer, merchant, artisan, soldier, writer, or man of science, who does not devote all his efforts to produce quicker, and more economically.

The contrary doctrine is that of theorists, deputies, journalists, statesmen, ministers, nevertheless these individually act upon the same principles that every one else does, to attain the greatest amount of result with the least labor. He then points out amusingly the contrary course of the theory and the practice of the most ardent Protectionists.

IV. *Egaliser les conditions de production.* In this he examines and refutes the Protectionist doctrine that the native producers should be put on an equality with the foreign producer, by protective duties equal to the difference of the expense of production.

V. *Nos produits sont grevés de taxes.* This is a continuation of the argument of the preceding essay applied to taxes.

VI. *Balance de commerce.* This is upon the oft-refuted fallacy of the Balance of Trade.

VII. *Pétition des fabricants de chandelles, bougies, lampes, chandeliers, réverbères, mouchettes, éteignoirs, et des producteurs de suif, huile, résine, alcool, et généralement de tout ce qui concerne l'éclairage, à MM. les membres de la Chambre des Députés.* Bastiat had well hit the fallacy which is at the root of so much false opinion in Political Economy, that labour is wealth, and that to create labor is to add to wealth. This essay is an amusing satire upon that doctrine, and is a petition of all persons concerned in the manufacture of artificial light to the chamber of deputies, against their natural enemy the sun, which inundated the country with a rival product to their own,—light at a fabulously low price, and whenever it showed itself it extinguished a great branch of national industry. To promote national industry they petition that every one should be prohibited from using sunlight.

VIII. *Droits différentiels.* A burlesque on differential duties.

IX. *Immense découverte!!!* Shews the absurdity of facilitating the means of transport, and neutralizing its effects by heavy custom duties.

X. *Réciprocité*. Shews the error of the reciprocity theory.

XI. *Prix absolus*. This shews the error of supposing that national prosperity or wealth, depends upon the absolute price of things, and shews the opposite results to which protection and free trade tend.

XII. *La protection élève-t-elle le taux des salaires?* Decides in the negative.

XIII. *Théorie, Pratique*. This throws back on the Protectionists the sneer which they habitually made against the free traders, that they were mere theorists, and had no regard to practice. Bastiat retorts that the free traders were the true men of practice, because there was not in the whole world a single man who in his own practice did not follow free trade principles, and that what was the invariable practice of each man individually, must be the true theory.

XIV. *Conflit de principes*.

XV. *Encore la réciprocité*.

XVI. *Les fleuves obstrués plaidant pour les prohibitionistes*.—This shows the absurdity of the same arguments in the mouths of opposite parties.

XVII. *Un chemin de fer négatif*.

XVIII. *Il n'y a pas de principes absolus*. This ridicules the cry that there are no absolute principles in Political Economy.

XIX. *Indépendance National*. This shows the fallacy of the Protectionist cry that every nation should be independent of its neighbours for its wants.

XX. *Travail humain, travail national*. Bastiat in this shows that those who cry out against foreign importations, ought, in consistency, to condemn all sorts of machinery, because they have precisely the same effects, and he ironically commends M. de Saint Chamans, a Protectionist writer, who does so. If foreign importations throw native workmen out of employment, machines displace human labour. A number of ill-informed economists—Sismondi among the rest—have always raised an outcry against machinery, for this very reason, but J. B. Say has shown that Sismondi's reasoning is erroneous, because it is based on the supposition that consumption is a fixed quantity, whereas consumption is, in most cases, capable of an almost indefinite extension. This argument of Say's is perfectly conclusive, but Bastiat has added to it in this essay another most important consideration. He shows that the introduction of machinery cannot possibly be injurious to the working classes as a body, because if any saving of capital is effected in production, and if the product is sold at a cheaper rate to the consumers, the capital saved by cheapening the production, and the money saved by the low price to the consumers, is available to increase employment in other ways. Thus any diminution in cost of production by machinery, necessarily provides a fund to support any men thrown out of employment. Thus it cannot injure the working classes as a body, though, no doubt, some individuals sometimes suffer.

XXI. *Matières premières*. This shows the fallacy of the common cry of admitting raw materials, and excluding the manufactured article.

XXII. *Métaphores*. This shows the dangerous fallacies which sometimes lurk in words, and the necessity of clear and precise language.

Bastiat concludes this series by pleading on behalf of the method he has adopted, as the one most likely to effect his purpose. A formal treatise has no doubt its advantages, and exposition of truth is always superior to the refutation of error. But to be useful it must be read, and is in general only addressed to a select audience. His one chief purpose was to make men think and investigate for themselves, and this was better accomplished by attacking in detail the errors of common opinion.

The second series was published in 1848.

I. *Physiologie de la Spoliation*.—In this, Bastiat follows up the ideas of the first series, and shows that protection is a system of spoliation.

II. *Deux Morales*.

III. *Les deux haches*. This is a further satire on a specious fallacy, that an increase of labour is an increase of wealth. It is a jocular petition of a carpenter that every one should be compelled to use blunt hatchets, in order to multiply work.

IV. *Conseil inférieur du travail*.—In this each trade in succession is called upon to set off the advantages and disadvantages of protection. The disadvantages are found to be numerous, and the advantage nil.

V. *Cherté, bon marché*. Advocates a total uninterference with prices.

VI. *Aux artisans et aux ouvriers*. Addressed to the working classes to dispel the false accusations which had been made against Bastiat and his friends, that they were agents of England, and explains to them in a familiar way some of the first principles of the subject.

VII. *Conte Chinois*. An amusing apologue to illustrate the master fallacy so often combated, that labor is wealth.

VIII. *Post hoc, ergo propter hoc*.

IX. *Le vol à la prime*. Shews the unfairness of bounties on production.

X. *Le perceuteur*. Analyses in a humorous manner the appropriation of the taxes.

XI. *L'Utopiste*. Explains, in a bantering way, the changes a utopian free-trader would make in the taxation of the country.

XII. *Le sel, la poste, la douane*. Explains in a comic dialogue, the advantage of the English Postal reform.

XIII. *La protection, ou les trois échevins*. A comedy in four tableaux, shewing up the absurdities of protection.

XIV. *Autre chose*. The chief cry against free trade among the Protectionists, was, that it displaced national industry. The inference was drawn by unthinking people that it destroys industry. Bastiat shews that it only transfers it to something else, and thus, with the same amount of labor, a much greater amount of products is obtained.

XV. *Le petit arsenal du libre-échangiste*. A list of some of the principal fallacies of Protection, with short answers to them.

XVI. *La main droite, et la main gauche*. This is another amusing attack on the fallacy Bastiat so often ridicules, that labor is wealth. It proposes that everyone should be compelled to use his left hand in order to increase the amount of national industry.

XVII. *Domination par le travail*. This is to dissipate a fear, that in peace the most industrious nation might overpower the weaker, as the

stronger in war. Bastiat shews that, while in war, the stronger nation overpowers and destroys the weaker, in peace, on the contrary, the superior industry of one nation assists and develops the industry of its weaker neighbours.

This concludes the second series of these brilliant essays. Bastiat had a third series in course of preparation, when the revolution of 1848 brought on a more pressing danger, viz., the Socialist Doctrines, which, in truth, had much in common with Protection. Bastiat, though worn out with ill health and fatigue, caused by his labors on behalf of free trade, hastened to combat the new enemy, and with indefatigable zeal published a series of pamphlets in opposition to the chief Socialist Doctrines.

Propriété et loi. In the *Journal des Economistes*, 15th May, 1848.

The Socialists maintained that property was the mere creation of the law, which could take away, equally as well as give, the right of private property. Bastiat argues on the contrary, that property is not the creature of the law, but that it is the fruit of a man's industry, and is anterior to law, which is made for the purpose of protecting property, but does not create it.

Justice et fraternité.—In the *Journal des Economistes*. 15th June, 1848.

Ridicules the Socialist doctrine of *fraternité*.

L'Etat. In the *Journal des Débats*, 25th Sept. 1848. An amusing satire on what people expected the state to do.

La loi. 1850.

On the proper limits of the functions of the law.

Propriété et spoliation. In the *Journal des Débats*, July, 1848.

Refutes Considerant's doctrines of the *Droit au travail*.

Baccalauréat et Socialisme.

Advocates freedom of education, and the abolition of the necessity of university degrees for obtaining employment.

Protectionisme et communisme. January, 1849.

A letter to M. Thiers, who has always been a strong advocate for Protection, shewing the community between Protection and Socialism.

Spoliation et loi. In the *Journal des Economistes*, 15th May, 1850.

The *conseil général* of agriculture, manufactures, and commerce, demanded in April, 1850, that the professors of Political Economy, paid by the government, should adopt, and teach it, on protectionist principles, such as were dominant in France, and not from the free trade point of view. In this essay Bastiat ridicules this demand.

Guerre aux chaires d'économie politique. This is on the same subject as the preceding; it was published three years before the last, in 1847. The Protectionist Society in Paris, in that year, modestly demanded that the Government should put down all professors of Political Economy, failing in that, they required that they should be compelled to teach Protectionist doctrine.

Capital et rente. February, 1849.

It was one of the Socialist doctrines that interest should be abolished as unlawful. In this essay, Bastiat investigates the nature of capital and interest.

Maudit argent. In the *Journal des Economistes*. April, 1849.

This is a most admirable dialogue on the nature

and functions of money. We most earnestly commend it to the attention of every student in Political Economy. In no other place that we are aware of, are the functions of money set forth and explained with such clearness of conception. But of the whole, which is so excellent, we will only quote one passage:

"C'est bien le moment d'analyser la vraie fonction du numéraire, abstraction faite des mines et de l'importation.

"Vous avez un écu. Que signifie-t-il en vos mains? Il y est comme le témoin et la preuve que vous avez, à une époque quelconque, exécuté un travail, dont au lieu de profiter, vous avez fait jouir la société, en la personne de votre client. Cet écu témoigne, que vous avez rendu un service à la société, et, de plus, il en constate la valeur. Il témoigne, en outre, que vous n'avez pas encore retiré de la société un service réel équivalent, comme c'était votre droit. Pour vous mettre à même de l'exercer, quand et comme il vous plaira, la société, par les mains de votre client, vous a donné une reconnaissance, un titre, un bon de la République, un jeton, un écu, enfin, qui ne diffère des titres fiduciaires qu'en ce qu'il porte sa valeur en lui-même, et si vous savez lire, avec les yeux de l'esprit, les inscriptions dont il est chargé, vous déchiffrez distinctement ces mots; '*Rendez au porteur un service équivalent à celui qu'il a rendu à la société, valeur reçue constatée, prouvée et mesurée par celle qui est en moi-même.*'"

We feel obliged to call attention to this passage, on account of its absolute coincidence with what we have shown to be the fundamental conception of monetary science. We have shown, in the article CURRENCY, that several writers had previously had a dim conception of it. But no writer, that we are aware of, has seen it with such clearness, or expounded it with such vividness, as Bastiat. It is beyond all doubt one of the most important conceptions ever introduced into Political Economy. Fully understood and developed, it is the true basis of monetary science; and it is against this fundamental conception that Law's theory of money sins, and all those wild schemes of founding a paper currency upon land, goods, or the public funds, which are so popular. It shows at once that money and instruments of credit are homogeneous, the one being *general credit*, and the other *particular credit*; and that the fundamental idea of *currency* is debt, or services due to the owner of it. The coincidence between this passage, and, indeed, the whole of this dialogue, and our own theory of money, as developed in our *Theory and Practice of Banking*, 1855, and *Elements of Political Economy*, 1858, is so remarkable that it might be supposed that we had adopted it from Bastiat. We think it necessary to state that this is not the case. Although our own work was published in 1855, and Bastiat's pamphlet in 1849, we had no knowledge of its existence till the 31st of May, 1859. We therefore joyfully cede the priority to Bastiat, being only glad enough that our own views, formed independently, should absolutely coincide with those of so great a master of Economic science.

Gratuité du Crédit.—Bastiat's pamphlet, *Capital et Rente*, had made an impression on the working classes, and produced a schism in the Socialist ranks. The Socialist leaders found it

necessary to combat him. One of the editors of the *Voix du Peuple* began the attack, which was continued by Proudhon. Bastiat was allowed to reply in the same paper. The discussion is continued through thirteen letters, when Proudhon, finding himself worsted, brought it to an end by loudly proclaiming himself the victor, and saying to Bastiat, "You are doubtless a good and worthy citizen, an honest economist, a conscientious writer, a faithful representative, a genuine republican, and a true friend of the people, but your last words give me the right to tell you, M. Bastiat, that in a scientific point of view, you are a dead man." Bastiat, however, replied to him in a concluding letter, which showed that he was by no means so annihilated as Proudhon supposed.

Ce qu'on voit et ce qu'on ne voit pas.—This was the last of the brilliant series of pamphlets, and was published in July, 1850. In it Bastiat opens a new vein of argument, which is capable of great extension. An immense proportion of error in Political Economy has arisen by only looking at *one* circumstance in the case, and wholly neglecting a multitude of other considerations, which are necessary to be taken into account before we can ascertain the general result. In this pamphlet Bastiat has treated of a few of these errors. It is a vein of argument which is capable of being worked with great success, and to a vast extent. Bastiat, however, was not the first to make effective use of this line of argument. Bentham had already anticipated him in the use of this powerful weapon. Bentham's refutation of the universal craze of his day, the rage for colonies, is an admirable example of this argument. (BENTHAM.)

This volume also contains a few minor pieces. The preceding two volumes are specially devoted to the refutation of current errors. However brilliant they may be, such works, as Bastiat himself was aware, are only of the second order. Like Samson, they perish along with their victims. Lasting fame is only given to those works which expound truth. The last volume of the series is Bastiat's crowning work, and contains his conception of the fundamental principles of the science. But it was left unfinished. When Bastiat felt the deadly inroads of disease on his frail constitution, his only wish was to live another year to complete his work. But that was not granted. To the irreparable loss of economic science, his greatest work remains only a fragment.

"Now is the stately column broke,
The beacon light is quenched in smoke,
The trumpet's silver sound is still,
The warder silent on the hill!"

Vol. VI. *Harmonies Economiques.*

This is universally allowed to be the greatest of Bastiat's works. His aim is to investigate the objects and the fundamental conceptions of Political Economy, and this he does in a series of Essays.

I. *Organisation Naturelle.* In this he treats of the organisation of society, and shews that the object of Political Economy is to treat of the *voluntary* association of persons, as distinguished from the schemes of the Socialists, which are all founded upon *compulsory* association.

II. *Besoins, efforts, satisfaction.* In this he investigates the true limits and objects of the science of Political Economy. He determines that it is founded upon the wants of mankind, and their reciprocal services ministered to their reciprocal wants and desires:—

"C'est en effet, cette faculté donnée aux hommes, et aux hommes seuls, entre toutes les créatures, de *travailler les uns pour les autres*; c'est cette transmission d'efforts, cet échange de services, avec toutes les combinaisons compliquées et infinies, auxquelles il donne lieu à travers le temps et l'espace, c'est LA précisément ce qui constitue la science économique, en montre l'origine, et en détermine les limites. * * *

"Accomplir un effort pour satisfaire le besoin d'autrui, c'est lui rendre un *service*. Si un service est stipulé en retour, il y a échange de *services*; et comme c'est le cas le plus ordinaire, l'économie politique peut être définie: la *Théorie de l'échange*.

"Quelle que soit pour l'une des parties contractantes la vivacité du besoin, pour l'autre l'intensité de l'effort, si l'échange est libre, le doux services échangés *se valent*. La valeur consiste donc dans l'appréciation comparative des *services* réciproques, et l'on peut dire encore que l'économie politique est la *Théorie de la valeur*."

It will thus be seen that Bastiat's conception of the nature, the objects, and the limits of the science of Political Economy absolutely coincides with our own.

III. *Des besoins de l'homme.* In this Bastiat inquires into the nature of the wants of men, and he takes the opportunity of stigmatising the fundamental error of the second school of Political Economy, that *labor is the cause of value*.

"Mais il y a des écoles qui ont rapporté au travail seul ce privilège. Leur axiome est: *Toute richesse vient du travail; le travail, c'est la richesse*. "Je ne puis m'empêcher de prévenir ici que ses formules, prises au pied de la lettre, ont conduit à des erreurs de doctrine énormes, et, par suite, à des mesures législatives déplorables."

IV. *Echange.* In this Bastiat investigates the nature of an exchange, and shews the functions that money and instruments of credit perform in decomposing them, and shews their natural limits.

V. *De la valeur.* Bastiat then investigates the conception of value, and shews that it is entirely founded on the mutual appreciation of services interchanged, and not upon labor.

"Ainsi la définition du mot valeur, pour être juste, doit avoir trait non seulement aux efforts humains, mais encore à ces efforts échangés, ou échangeables. L'échange fait plus que de constater, et mesurer les valeurs, il leur donne l'existence. Je ne veux pas dire qu'il donne l'existence aux actes et aux choses qui s'échangent, mais il la donne à la notion de valeur.

"Or quand deux hommes ce cèdent mutuellement leur effort actuel, ou les résultats de leurs efforts antérieurs, ils se *servent* l'un l'autre, ils se rendent réciproquement *service*.

"Je dis donc: LA VALEUR, C'EST LE RAPPORT DE DEUX SERVICES ECHANGES.

"L'idée de *valeur* est entrée dans le monde la première fois qu'un homme ayant dit à son frère: Fais ceci pour moi, je ferai cela pour toi,—ils sont tombés d'accord; car alors pour la première fois

on a pu dire: les deux services échangés se valent. * * *

"De l'ECHANGE, nous travaillons pour nous nourrir, vêtir, abriter, éclairer, guérir, défendre, instruire les uns les autres. De là les services réciproques. Ces services, nous les comparons, nous les discutons, nous les évaluons; de là la VALEUR."

He shews that many circumstances affect value, and points out the false origins which have been attributed to the word.—

"On a jusqu'ici cherché le principe de la Valeur dans une de ces circonstances qui l'augmentent ou qui la diminuent, matérialité, durée, utilité, rareté, travail, difficulté d'acquisition, jugement &c.; fausse direction imprimée dès l'origine à la science, car l'accident qui modifie le phénomène n'est pas le phénomène. * * *

Ainsi le principe de la Valeur est pour Smith dans la matérialité, et la durée, pour Say dans l'utilité, pour Ricardo dans le travail, pour Senior dans la rareté, pour Storch dans le jugement, &c."

He then shews the confusion into which the science has been thrown by these contradictory conceptions, and shews that the only true source of value is *exchangeability*.

The natural consequence of this view, is that all services which are exchanged, are economical elements, whatever their nature be, whether material, or immaterial; and that all labour is *productive* labor, which produces any service which is wanted. Hence those persons who satisfy any of our mental desires, such as opera singers, are included in that category. Bastiat then points out at great length the erroneous conclusions to which the doctrines of preceding economists on the conception of value lead. The whole essay is most excellent.

VI. *Richesse*.—Examines into the contradictory notions which prevail with regard to wealth.

VII. *Capital*.—In this, Bastiat investigates the nature of capital, and shows that, from the fundamental conception of value already obtained, any service may be employed as capital. He also has almost succeeded in obtaining the true notion of credit:—

"Ce qui est plus surprenant encore, c'est que nous pouvons faire l'opération inverse, quelque impossible qu'elle semble au premier coup d'œil. Nous pouvons convertir en instrument de travail, en chemin de fer, en maisons, un capital qui n'est pas encore né, utilisant ainsi des services, qui ne seront rendus qu'au xxe siècle. Il y a des banquiers qui en font l'avance sur la foi que les travailleurs et les voyageurs de la troisième ou quatrième génération pourvoient au paiement; et ces titres sur l'avenir se transmettent de main en main, sans rester jamais improductifs." Here we have exactly the very doctrine that we have enforced, that CREDIT IS CAPITAL. Though it is not usual to pledge services which will only be rendered three or four generations hence, services to be paid for three or four months hence, constitute an immense article of commerce, under the name of Bills of Exchange.

He then discusses the nature of interest.

VIII. *Propriété, communauté*.—Discusses the nature of property, and refutes the socialist delusions on the subject.

IX. *Propriété foncière*.—Discusses the nature

and the right to property in land, and the views of English and socialist writers on the subject.

X. *Concurrence*.—Discusses the nature and effects of competition.

This terminates the first series of essays published by Bastiat. Sketches for several others were found among his papers after his death, and have been published along with the series, in this edition. We are glad to have anything proceeding from so eminent an author, but as they never received his *imprimatur*, they must not be considered as containing his final conclusion on the several points.

We trust that the extracts we have given from Bastiat's two greatest works may have the effect of sending our readers to the originals themselves, and we may now make a few general observations on them.

Although the *Sophismes Economiques* were published as detached essays, there is a thread of argument which runs through them all. They are brilliant portions of a general attack on a particular state of opinion, and it may perhaps be of some advantage to attempt to state it in a connected argument.

France was imbued to the core with Protectionist opinions, and her commercial system was becoming more exclusive every day. The Protectionist, or prohibitionist, system is to endeavour to foster native industry as much as possible, and to exclude all commodities which can be produced at home, under the idea that they displace and destroy national industry. The argument of the Protectionists was that wealth could only be got by industry, that labor was wealth, and that every means should be adopted to increase national labor.

To meet this argument, Bastiat says, that if every one had to provide everything for himself, he would naturally desire to obtain the greatest possible result, with the least possible labor. He would never suppose that the labor, the means by which the product was obtained, was the actual wealth. He would manifestly see that it is the *product* which is the wealth. The *beau idéal* of such a condition would be that everything he wanted should be obtained without labor at all, like sunlight, air, water, &c. And as the wealth of the whole state would be the aggregate of the wealth of each individual, the whole state would be the more wealthy just in proportion as the least amount of labor produced the greatest amount of products.

This being granted as perfectly self-evident, if we suppose the whole state to be composed of individuals working for themselves, the general result cannot possibly be different, if the notion of exchange is introduced. No matter how things are produced, the general result must be the same. The community in general must be wealthier, and better off, just in proportion as the greatest amount of products is obtained with the least amount of labor. In this proposition it can make no difference *how* things are produced, or who produce them, whether each man for himself, or each for his neighbours. This is so manifestly true, that any doctrine contrary to it is evidently false.

But he says that the necessary and avowed consequence of the Protectionist policy is to diminish the quantity of production, obtained by any given

amount of labor, or expenditure. Where then is the fallacy? He says that it arises from a confusion of ideas, which arises on the introduction of the notion of exchange. The doctrine of exchange introduces the division of labor, and as that is carried out to greater perfection, each man more and more confines himself to produce one particular thing by which he hopes to obtain all other things he wants, by exchanging with those who produce what he wants. Now between men's desires and their gratification, Providence has in general opposed obstacles, which can only be overcome by human labor. By the principle of the division of labor, each man confines himself to overcome one obstacle to the gratification of his fellow-citizens. The exertion he makes to do so is labor, and of course the greater remuneration he can get for his labor the better for him. Thus labor itself becomes an article of commerce, and is in fact wealth to the laborer. Each man separately, therefore, tries to make his labor as dear as possible, and as profitable to himself as possible; and he rejoices to see the obstacles, which it is his peculiar function to combat, increased and multiplied, because he hopes to obtain a greater reward for doing so. Thus in the increase of obstacles each man sees an increase of wealth, and hence the notion gets possession of bodies of men that to increase obstacles, to increase national labor, is to increase wealth. Thus, Bastiat shews that if the views of each producer are acted upon, the result must be a very great increase of labor as compared with the result. That is, the result must diminish as compared with the means used. Consequently, the general result of Protectionist legislation to the nation must manifestly be to diminish its wealth. The whole fallacy rests upon the idea that labor is wealth, that to multiply labor is to multiply wealth, and that the great aim of the legislator should be simply to increase national labor. Having thus arrived at the fundamental misconception of the subject, Bastiat devotes all his powers of ridicule, burlesque, sarcasm, wit, and humor to combat it. Thus we have the petition of the manufacturers of artificial light to put down the use of sunlight, their great natural enemy, which is so destructive to so large a branch of national industry, by superseding the use of their product;—the petition of the carpenter, that every one should be compelled to use *blunt* hatchets, in order to multiply national labor;—the petition that every one should be compelled to use his *left* hand, with the same object;—the Chinese apologue, and others.

Bastiat then shews the utter inconsistency of men's conduct in their own affairs, and their doctrine with regard to the state. The most red-hot Protectionist will always act upon free-trade principles in his own business, and do his utmost to produce the greatest effect with the least means. He will, for his own benefit, eagerly adopt every method to abridge his own labor, and produce as economically and quickly as possible. But when he comes to deal with the state, he does exactly the reverse. He then tries to do everything to increase the labor and diminish the result.

But, say the Protectionists, it is admitted that all wealth proceeds from industry, and consequently if foreign products are introduced cheaper than they can be manufactured at home, they will supersede native products, and thus *destroy* na-

tional industry, which is the source of wealth. No! says Bastiat, that is not so! If foreign products are introduced, they must be paid for by native products, and the quantity of native industry which is set free from manufacturing products at a dear rate, is employed partly in manufacturing *something else* to buy those cheaper foreign products with, and partly is capable of being applied to produce something else in addition to gratify some other wants. Thus as a body the national industry is not injured at all, and the general result to the nation is not only that they obtain the same quantity of produce as before, but in addition to that, the expense saved may be applied in obtaining other gratifications. Thus the national industry remains the same, but its products are greatly increased, and consequently the national wealth augmented. Thus we obtain the great doctrine that the national industry is not *destroyed*, but only *transferred*.

Again, says Bastiat, the very same arguments which have been used against foreign importations apply against machinery of all sorts, even the very humblest. The simplest machine or implement displaces human industry. They ought therefore all to be put down, steam-engines, carriages, roads, ploughs, beasts for agriculture, even spades. If the great object is to promote national industry, the only logical conclusion is to scratch the ground with our nails. This would greatly multiply the labor necessary to produce any required quantity of corn, and therefore would greatly increase the national wealth in that point of view. There has accordingly been, among the ill-informed, a very general prejudice against machinery, on the supposition that it displaces human industry, which has been adopted by Sismondi. But J. B. Say shewed that his fallacy lay in assuming that consumption is a fixed quantity, which is a monstrous error. Consumption is capable of being increased to almost any extent. Moreover, as Bastiat has satisfactorily shewn, and we believe he was the first to notice it, whatever fund is saved from the expense of the productions is ready to provide a maintenance for those whose labor is displaced by any machinery. Thus we arrive at the same general result as in the former case, no national industry is *destroyed*, it is only *transferred*, and for the same amount of industry the national enjoyments are greatly increased.

Thus Bastiat proves that foreign importations of commodities which can be produced cheaper abroad, and the improvements effected by machinery, are in all respects analogous. No doubt, in all states of transition from one system to another, a few individuals are the victims of the improvement, but the profit to the nation is immense.

Thus Bastiat shews that the Protectionist system is manifestly adverse to what is acknowledged to be national welfare.

It has often been remarked, that these were not truths discovered by Bastiat, but only expounded by him with great ability, and many are disposed to disallow his claim to be an original discoverer for that reason. Nor can it be denied that there is some truth in this. Bastiat himself acknowledges that to refute error is only the second glorious part. But that would not deprive him of his claim to be placed in the first rank of economists. The truths contained in the Sophismes were perhaps not new, but they had never before

been expounded with such admirable power and precision, nor one so specially adapted to the character of the people to whom they were addressed. The whole aim of these writings is to overthrow Protection by making it ridiculous. The *Sophismes Economiques* are the Don Quixote of Protection. The truths are so admirably put, that no one who reads them can feel that it is possible to think otherwise, and they are as amusing as a novel. No writings were ever better calculated to effect their object, and we are happy to be informed by M. Paillottet that their circulation has been immense, for such a work. Even men who are already persuaded of the truths they inculcate, cannot fail to derive benefit from them. The fallacies of Protection are in many respects extremely plausible, and it is easy for persons who live after their refutation, to sneer at those who once held them. The time may come, perhaps, when the whole world will be converted to free trade, but we fear that that time is still a very long way off, and until that time comes, the *Sophismes* will probably remain the most effective weapon to combat Protection.

The *Sophismes* then, we have seen, were only intended by Bastiat to clear the way to the establishment of the true system of Economic Science. The work in which Bastiat proposed to erect a positive system is the *Harmonies*.

All economists, of whatever school, are agreed that the word *Value* is the fundamental conception in the science. But between the first two schools of Political Economy and the third, there is a broad and fundamental distinction between their conceptions of the term. The most eminent writers of these two schools differ widely amongst themselves as to the cause and measure of value; but they all agree in this, they consider value to be *something inherent in the article itself*. The common feature of these two schools is that they make value a quality of the article, either materiality, durability, utility, or something of that sort. But a few writers have taken a completely different view of the subject. Aristotle in ancient times, Barbon in 1696, and more recently Mr. Samuel Bailey in 1826, Archbishop Whately in 1831, and Mr. Jennings, and we have no doubt others, have seen that value is not a quality which resides in the article itself, but that its source lies in the mind of the person who desires an article. Thus we have seen above that Aristotle says that the *source* of value is the *desire* of any person to possess a thing, and the *measure* of value is the *quantity* of things, usually money, he will give to obtain possession of it. Now this is manifestly a completely different notion of value to that entertained by the first two schools of Political Economy. And there can be no doubt whatever that mature reflection will shew it to be the true conception. For if value be any quality whatever of the article itself, it is quite clear that so long as that quality remains the same, the value of the article cannot change. But universal experience demonstrates the gross error of this view. It is notorious that the value of articles constantly change, while all their qualities remain the same. And the reason is plain, either the desire for them has changed, or the supply has changed, or both may happen, without in any way affecting the qualities of the articles themselves. And their values change accord-

ingly, which indubitably proves that value is something altogether *EXTERNAL* to the article. And this is why we say that Bastiat is one of the great founders of the *THIRD ERA* of Political Economy, because the whole of his essay on Value is for the express purpose of enforcing this doctrine, that value is not a quality of the article itself, but is the mutual estimation of two services which are exchanged.

Thus we at once obtain the great fundamental doctrine that *VALUE REQUIRES THE CONCURRENCE OF TWO MINDS*. Now this doctrine is utterly subversive of the two preceding schools of Political Economy, and exactly reverses the whole of their fundamental axioms. Ricardo and his followers consider labor exclusively as the source of value, and cannot conceive value to exist except as the result of labor, a principle which Mr. McCulloch and Mr. De Quincey have pushed to the most absurd extremes. In 1831 Archbishop Whately sent a deadly shaft into the heart of this fallacy. (*Lectures*, p. 167, 4th Ed. 1855). He says, "Now it is true, *if so happens*, by the appointment of Providence, that valuable articles are, in *almost* all instances, obtained by labor, but still this is an *ACCIDENTAL* not an *ESSENTIAL* circumstance." And this we have seen above is the very expression used by Bastiat, no doubt preceded him. Now we have shewn, in the Preliminary Discourse, that utility, materiality, durability, scarcity, and in fact all qualities which reside in the article itself, are to be rigidly excluded from the conception of value, and that it means simply *exchangeability*, and hence necessarily requires the concurrence of two minds.

Now this is precisely the doctrine that Bastiat enforces with all his usual clearness of conception and vivacity of illustration. This he considers to be the true fundamental conception of the science, and that its true objects and limits are to investigate and develop the theory of value, or of exchanges.

Now this is the restoration of the Aristotelian doctrine of value, and it is beyond all comparison the *GREATEST REVOLUTION that has been effected in any science since the days of Galileo*.

It is true that objections have been made by eminent writers against this definition of the science, as being too narrow, and they adhere to the definition of its being that of the production, distribution, and consumption of wealth, or some variation of it, as being more comprehensive. But we have shewn, (PRELIMINARY DISCOURSE; CONSUMPTION; PRODUCTION) that by giving a proper interpretation to the words *production and consumption*, *PRODUCTION AND CONSUMPTION together constitute EXCHANGE*, and that *distribution* depends upon the number and the character of the exchanges effected. We have shewn that an error infects the common use of the word consumption, exactly analogous to that which infects the common use of value. For while labor is the *accident* and not the *essence* of value, destruction is the *accident* and not the *essence* of consumption. In Political Economy, production is bringing some service to the market for sale, consumption is purchasing it, or taking it out of the market. Thus it is consumption and not labor which gives value to production. Two parties who wish to exchange are each producers, and each con-

sumers, of their own, and each other's, service. And it is the reciprocal consumption which gives value to the reciprocal production, and the complete transaction constitutes an exchange. Thus we see that the definition of Political Economy proposed by J. B. Say, and so much in favor with writers of the second school, is, in fact, reduced into the definition of the third school.

Having thus firmly settled that Political Economy is the science of exchanges, Bastiat naturally follows up this conception, and shews that any service which may be exchanged, whatever its nature be, material or immaterial, is an economical element, and is included in the science, and that as capital is only a particular method of employing an economical element, any service whatever may be capital.

He has also clearly seen and expounded in his *Maudit Argent* the true doctrine of money. He explains that it is the representative of services due to the possessors of it, or of *DÉBIT*, thereby at once establishing the great doctrine, that money and instruments of credit are homogeneous. This is the true fundamental conception of the Theory of Money, and is one of the most important conceptions ever introduced into Political Economy. It is the true criterion of the limits of the currency, and we have shewn its immense importance in the articles *CURRENCY* and *LAW*. We have shewn that Law's theory of money is contrary to this conception, and that it gives the true solution of that problem in monetary science which is so much discussed at the present day. (*BILL OF EXCHANGE; CREDIT; CIESZKOWSKI; HILL, EDWIN.*)

There is only one point on which Bastiat's clearness of conception has been at fault. We have seen above, that he says that not only every existing economical element may be used as capital, but that we may perform the *INVERSE* operation, and utilise future services by turning them into productive capital. Now, the utilisation of future services is *CREDIT*, and we have shewn (*PRELIMINARY DISCOURSE; CREDIT*) that instruments of credit in Political Economy are exactly analogous to *NEGATIVE QUANTITIES* in Algebra and Natural Philosophy, which have a real existence, although they were a sore puzzle to the early Algebraists. Now, this is exactly Bastiat's conception when he says that we may perform the *inverse* operation, and use future services as productive capital. Bastiat thus substantially acknowledges the great doctrine, that *CREDIT IS CAPITAL*. But in an article on *Credit*, in the *Ce qu'on voit et ce qu'on ne voit pas*, he has fallen into a most strange inconsistency; for he there ridicules the notion that credit is wealth, and treats it merely as the transfer of existing commodities. Now, we have shewn that Mr. Mill has fallen into exactly the same inconsistency (*CREDIT; MILL, JOHN STUART*). In one part of his work, he laughs at the notion that credit is productive capital; in another part, he maintains that bank notes are capital, and also bills of exchange, which he says rightly, are not generically different from bank notes. Now, what is the cause of these manifest self-contradictions in these two eminent writers? It is as plain as the sun at noon-day. They are most remarkable examples of the *Fallacy of Ambiguity*. In different parts of their works, they

form different conceptions of what credit is. In one part they only look to the transfer of the article, and then they deny that credit is capital; in the other, they look to the circulation of the instrument of credit, and see that it is used as a substitute for money, and then they maintain that credit is capital. It is almost needless to say that of these two conceptions, the latter is the true one, and the former erroneous. Instruments of credit are real independent economical elements, like the negative quantities in algebra, and may be used as capital.

This branch of the subject, however, is capable of immense development, strictly following from Bastiat's conception.

In short, as we have fully explained elsewhere (*PRELIMINARY DISCOURSE; CAPITAL*), confining Political Economy to the limits of positive material quantities, is exactly as if we were to bring back Algebra to the narrow bounds of Arithmetic, and to reject incorporeal forces from mechanics, and invisible elements from chemistry. The battle whether incorporeal elements are to be admitted into Political Economy was fought in the days of Galileo, who could not get his opponents to believe in gravity as a mechanical force, because it was incorporeal.

In 1856, without the slightest knowledge of Bastiat's works, or even of his name, but merely seeing the utter confusion that reigns in the current opinions on Political Economy, we said (*Introduction to Vol. II. Theory and Practice of Banking, § 85*) "THE TIME HAS COME WHEN ALL POLITICAL ECONOMY MUST BE RE-WRITTEN." And this we repeat. There is no doubt a vast quantity of fragmentary truth ascertained, but it is only detached portions, without due scientific connection. We have no doubt that Bastiat has obtained the true fundamental conception which will reduce into harmony and order this vast mass of ascertained truth, and shew its connection. We have no doubt that taking his conceptions, and developing them in a spirit exactly conformable to that on which the physical sciences are treated, Political Economy may be raised to a precision, a magnificence, a grandeur, and a compass which has never yet been dreamt of, and which will fit it in all respects to take an equal rank with the most complete of the physical sciences.

Bastiat breathed a wish (*Correspondence Vol. I. p. 204*), "Je ne dissimule pas cependant un vœu personnel. Oui, je désire que cette théorie (de valeur) rencontre, de mon vivant, assez d'adeptes, (ne fût-ce que deux ou trois,) pour être assuré, avant de mourir, qu'elle ne tombera pas, si elle est vraie. Que mon livre en suscite seulement un autre, et je serai satisfait." We rejoice to think that, quite independently, we have formed exactly the same fundamental notions on all the leading points in Political Economy as Bastiat did, and that this Dictionary is written for the express purpose of constructing the Science of Political Economy on those very conceptions. And we hope that this may bring about an *entente cordiale* between the economists of England and France.

It is to France that we must probably look in future for the best economists. It is natural to find the best physicians where diseases are most rife, the best organized fire brigades where fires

are most frequent. In England, the principles of free trade are triumphant, and almost unquestioned. Consequently there is no longer a necessity to defend what is assumed as a matter of course. But in France the case is different. That pleasant land is still deeply involved in economical darkness, and consequently it is there that we must henceforth expect the most brilliant efforts to enlighten it. Notwithstanding the illustrious men who, whatever their differences may be as to the best method of treating the subject, are all firmly united in the practical part of it, namely, the principle of free exchanges, the progress of these opinions is apparently but slow and disheartening, and yet from their scientific beauty they seem peculiarly adapted to find acceptance in the French mind. But there is reason to hope well. The sale of Bastiat's works has been immense, considering their nature. M. Pailletot has supplied us with some details which we think will interest our readers. He tells us that of Bastiat's smaller works, published in 12mo, and containing the *Sophismes* and the pamphlets, there have been sold 20,000 copies. Of *Cobden et la ligue*, in the first edition 1000 copies; of the *Harmonies*, first edition, 1000 copies, of the second edition, 2000 copies. At the end of last December, 1858, of his complete works, in 6 vols. 12mo, 16,600 volumes had been sold; and a fourth edition of the *Harmonies* is now being printed. This must indicate progress, too slow perhaps to gratify the wishes of the best friends of France, but it must be sure, and we fervently hope that it may not be long before the fruits of so much glorious labor may begin to manifest themselves.

BASTIDE D'IZAR, L.

Mémoire sur les contributions indirectes relatives aux boissons. Paris, 1830.

BASTIEN. Citoyen.

Pétition à l'assemblée nationale respecting assignats. Paris, 1792.

An enquiry into the conduct of our domestic affairs from 1721 to Christmas 1733, in which the case of our national debts, the sinking fund, &c., are particularly considered. London, 1734.

Case of the sinking fund, and the right of the public creditors to it considered. London, 1735.

Considerations on the present state of public affairs, and the means of raising the necessary supplies. London, 1739.

BAUDEAU, NICHOLAS, L'Abbe.—One of the most able and ardent of the disciples of Ques-

nay, or the Physiocrate school of Political Economy, was born at Amboise, 27th April, 1730. Being destined for the church, he began to study for it, and he became a regular canon, and Professor of Theology in the Abbey of Chancelade. He was some time after invited to the capital by M. De Beaumont, the Archbishop, a zealous anti-Jansenist. His taste inclined more to science than theology, and he abandoned his clerical position. In 1765 he founded a journal named *Ephémérides du Citoyen*, or *Chronique de l'esprit national*, in which he warmly opposed the doctrines of Quesnay. Dupont de Nemours was Editor of the *Journal de l'agriculture, du commerce, et des finances*, also founded in 1765, which was a common fighting ground for the partisans and the opponents of the mercantile system. Le Trosne, who was king's advocate in the bailiwick of Orleans, attacked some of the doctrines maintained by Baudeau in his paper. The latter prepared a series of letters in defence of them, the first of which was inserted in Dupont's paper. The editor inserted it with some comments of his own, which had the effect of converting Baudeau, who was a sincere inquirer after truth, and he henceforth became an ardent disciple of Quesnay. In 1767, the partisans of the mercantile system had strength enough to drive Dupont de Nemours from the editorship of his paper, and he took refuge with Baudeau. They were joined by the Marquis of Mirabeau, and the paper was then called *Bibliothèque raisonnée des sciences morales et politiques*, and became the earnest advocate of free trade doctrines, and the uncompromising antagonist of the spirit of monopoly, in all its shapes and forms. In May, 1768, Baudeau resigned the editorship to Dupont de Nemours, but, nevertheless, continued one of its most active contributors. Soon afterwards the Bishop of Wilna gave him an ecclesiastical appointment in Poland, which did not seem to have many attractions for him, as he soon returned to Paris.

In 1772 the publication of the *Ephémérides* was stopped by a royal command. When Turgot was appointed minister, Baudeau revived his paper under the name of *Nouvelles Ephémérides économiques*, ou *Bibliothèque raisonnée de l'histoire, de la morale, et de la politique*. The publication lasted from January, 1775, to June, 1776, when that great minister being compelled to resign, the paper stopped.

In 1771 Baudeau published his *Première introduction à la philosophie économique*, ou *Analyse des états politiques*, which is one of the best and most lucid expositions of the Physiocrate doctrines. During the administration of Turgot, he published a reply to Necker's work on the corn laws. Necker was a strong protectionist, and the party opposed to the government and free trade considered it a masterpiece. Baudeau, however, completely answered him. He had also written a memoir against the butchers' bank in 1768, which, however, had not obtained permission to be published. In 1776 this was published in the *Ephémérides* for February, and in the same month the bank, called *Caisse de Poissy*, was suppressed by Turgot. (Turgot.) The farmers of the bank prosecuted him for libel, but Baudeau defended himself with such success as to turn

public opinion in his favour, and the farmers were obliged to abandon their case.

But, though he gained his cause, it was a disastrous victory. Turgot fell, and the anger of his defeated opponents obtained an order commanding him to maintain silence on all subjects of public administration. As he seemed inclined to resist this edict, a *lettre de cachet* was issued, exiling him to Riom. After this, Baudeau seems only to have published one short tract against Necker's system of finance and his passion for loans.

Baudeau's mind is said to have given way during the latter years of his life, and he is supposed to have died in 1792. He was a man of very varied acquirements. He was a member of the Academy of Bordeaux. In this place we shall only enumerate his economical works. We have considered the doctrines of the school of Political Economy, of which he was one of the most distinguished members, in the PRELIMINARY DISCOURSE, and under PHYSIOCRATES.

Baudeau was the founder of, and a very active contributor to the *Ephémérides du Citoyen*, or *Chronique de l'esprit national*, 1765-67, which supported Protectionist opinions.

In 1767 Baudeau was converted to free trade opinions, and his journal was henceforth called *Ephémérides du Citoyen*, or *Bibliothèque raisonnée des sciences morales et politiques*, Paris 1767-1772.

In the first and ninth numbers of this work for 1768, he advocates the entire and complete freedom of trade in corn.

The chief articles in this journal which may be cited are one in Part I. for 1767, to prove that the *produit net* of land is the only national revenue, and that upon it all the taxes and debts of the state fall.

Part II.—*Recherches politiques sur les terreurs populaires qui cause le bon prix des grains, et sur les moyens de les calmer. De l'origine et de la nécessité des hérédités foncières.*—Part III. *Du faste public et privé—Vrais principes du droit naturel.* Part VI. *Réflexions sur la réforme dans la répartition des tailles.* Part VIII.—*Du sens du mot STERILE appliqué à l'industrie.* Part IX.—*Dissertation sur la non-productivité de l'industrie.* Part XI.—*Explication du Tableau économique à M. de * * * * ** *Réflexion sur l'ordre naturel et essentiel des sociétés politiques, et critique des "Eléments du Commerce" de Forbonnais.*

1768. Part I.—*Avis au peuple sur son premier besoin, ou petits traités économiques sur le blé, la farine, et le pain: 1re partie, De l'entière et parfaite liberté du commerce des blés.* Part II.—*Avis au peuple, &c. : 2de partie, Traité sur la monture des grains, et sur le commerce des farines.* Parts IV and V.—*Avis au peuple, &c. : 3me partie, Traité sur la fabrication et le commerce du pain, et sur le vrai moyen de pourvoir aux approvisionnements publics.* Part IX.—*Résultats de la liberté parfaite, et de l'immunité absolu du commerce des grains, de la farine, et du pain; et conséquences pratiques de ces résultats.* Parts X and XI.—*Avis aux honnêtes gens, qui veulent bien faire, dans lequel on leur indique les moyens de procurer au pauvre peuple du pain meilleur et à meilleur marché.*

1769. Part X.—*Suites des Avis au peuple sur la cherté du pain et le monopole des blés.* Part XII.—*Lettres à M. l'abbé Galiani, sur ses Dialogues anti-économistes.*

770. Part VII.—*Lettre à M. Béardé de l'Abbaye, sur sa critique prétendue de la science économique.*

In the *Nouvelles Ephémérides* his principal economical writings are—

1775. Part II.—*Réfutation d'une lettre apologétique sur les corvées.* Part III.—*Mémoire détaillé sur les taxes payées ci-devant par le poisson de mer, frais ou salé, qui se consommait dans la ville de Paris.* Part IV.—*Lettre à M. Necker, sur son éloge de Colbert.* Part V.—*Le profit des peuples et le profit du roi, éclaircissement demandés à M. Necker sur ses principes économiques, et sur ses projets de législation, au nom des propriétaires fonciers, et des cultivateurs français.*

1776. Part II.—*Mémoire sur la Caisse de Poissy.* Parts IV and V.—*Observations économiques à M. l'abbé de Condillac, sur son livre "Du Commerce et du Gouvernement."* Part VI.—*Mémoire sur les affaires extraordinaires, faites en France pendant la dernière guerre, depuis 1756 jusqu'en 1763.*

His writings not inserted in the *Ephémérides* are:—

Idées d'un citoyen sur l'administration des finances du Roi. Paris, 1763.

Idées d'un citoyen sur le commerce d'Orient, et sur la Campagne des Indes. Amsterdam and Paris, 1765.

Idées d'un citoyen sur les besoins, les droits, et les devoirs des vrais pauvres. Amsterdam, 1765.

Lettres sur les émeutes populaires, qui causent la cherté des grains, et sur les précautions du moment. Paris, 1768.

Lettres d'un citoyen sur les vingtièmes, et autres impôts. Amsterdam, 1768.

Première introduction à la philosophie économique, ou Analyse des états policés. Amsterdam, 1771.

Questions proposées à M. Richard de Glasnière, sur son plan d'imposition soi-disant économique. Paris, 1774.

Sur l'état présent de l'agriculture en Angleterre traduit de l'Anglais, avec des remarques sur l'état de l'agriculture en France. Paris, 1778.

Principes économiques de Louis XII., et du Cardinal d'Amboise, de Henri IV., et du duc de Sully, sur l'administration des finances opposés aux systèmes des docteurs modernes.

Baudeau announced a new edition of the *Economies Royales* of Sully, but only two volumes appeared.

BAUDOUIN, A.—Formerly Secretary to the 1st Chamber of Commerce in Algeria.

Annuaire des Institutions de crédit financier, commercial, et industriel de la France, et des principales places de l'Europe. Paris, 1853.

BAUDRILLART, HENRI.—Assistant Professor of Political Economy at the *Collège de France*, was born 28th November, 1821, the son of a lawyer. He was educated at the *Collège Bourbon*, and gained the prize in philosophy in 1841. In 1846 he gained the prize at the *Académie Française*, for his éloge on Turgot; and, in 1850, for that on Madame de Staël. In 1852, on the recommendation of M. Michel Chevalier, he was appointed his assistant professor at the *Collège de France*; and, in 1853, he was awarded

a prize at the Institute for his *Bodin et son temps*.

Jean Bodin et son temps. Paris, 1853.

Manuel de l'Economie Politique. Paris, 1857.

This manual is a summary of the lectures delivered by M. Baudrillart, in his capacity of professor, and, therefore, it demands our attention. We are happy that we may place him in the third school of Political Economy, namely, the one that considers exchange to be the fundamental conception of the science. He says, p. 8, "Nous définirons dès à présent l'économie politique, la science qui a pour objet la manière dont la richesse se produit, s'échange, se distribue, et se consomme; or, comme rien de tout cela n'a lieu sans travail, et sans échange, et comme d'une autre côté, aucun de ces travaux et des ces échanges ne s'opère au hasard, il s'ensuit que les lois qui président au travail, et à l'échange, forment le véritable champ de science économique." Also, p. 18, "Sous les formes diverses qu'il revêt, échange d'idées, échange de sentiments, l'échange est le lien unique de la société, il en est un des principaux sous sa forme spécialement industrielle. Sans trop faire violence au langage, peut-être peut on dire que certain animaux travaillent, on peut aller peut-être jusqu'à prétendre que la fourmi capitalise, mais ils n'échangent point. L'échange est la sociabilité en action. * * * L'échange, posé en tête de l'économie politique résume tout la reste. Il n'y pas un seul fait économique qui ne suppose ce fait, et qui ne s'y ramène." He also well draws the distinction between Political Economy and technology, and also between it and statistics.

He excludes immaterial products from Political Economy. As we have fully examined the subject in the PRELIMINARY DISCOURSE and under CAPITAL, we shall say no more about it here.

On the meaning of Value he says: "Il résulte de ce qui vien d'être dit, que la valeur ne désigne qu'un rapport d'échange, elle ne fait qu'exprimer la puissance d'acquisition d'un objet par rapport aux autres." He adopts Bastiat's definition of Value. (BASTIAT.)

He adopts the principle that supply and demand regulates all exchanges, p. 219; and he sees that Ricardo's law of cost of production is only a particular case of the general law.

It follows from the preceding extracts, that M. Baudrillart holds the same fundamental conception of the nature of the science as ourselves, although his work is divided into the heads of production, distribution, and consumption. We think it may be better treated by exclusively adopting the conception of exchange.

On the subject of money, M. Baudrillart has not advanced beyond J. B. Say, and he has passed over the true fundamental conception of it, which Bastiat so clearly saw. (BASTIAT.)

But we regret to say that on the subject of credit M. Baudrillart has gone altogether astray, and has adopted the ideas of M. Cieszkowski, the modern Law. Most truly he says that the importance of economical laws is apparent when we reflect on the evil of adopting false ones. A false view of credit will ruin thousands of families, and perhaps compromise the future of a nation. He then cites the fatal results of the theories of Law, and the Convention. But, marvellous to say, he has adopted the very ideas he so strongly con-

demns. The doctrines of Cieszkowski are the identical doctrines of Law.

M. Baudrillart treats instruments of credit as signs of wealth, and classes them together with Dock warrants. This is as we have shewn (BILL OF LADING; DOCK WARRANT; BILL OF EXCHANGE; CREDIT; LAW) the very fundamental error upon which Law founded his theory of money. And the clear understanding of the fundamental distinction between them, is at the very root of Political Economy.

M. Baudrillart does not give any opinion on the disputed question whether bills of exchange are currency of not, but he refers to M. Chevalier's *La Monnaie*, which he says exhausts the subject. We may therefore infer that M. Baudrillart adopts the opinions of his eminent colleague. Now M. Chevalier entirely adopts the opinion that bills of exchange are currency, together with money. If, then, bills of exchange and money are both currency, they must both be of the same fundamental nature. Consequently, if bills of exchange are signs of wealth, money must also be a sign of wealth. The very error which is at the root of Lawism, and which the early economists had so much labor in combating! Oh! no; money is not a sign of wealth, nor are bills of exchange, or instruments of credit. Bills of lading and dock warrants are NOT CREDIT. Money and instruments of credit are independent entities; bills of lading and dock warrants are not independent entities. We earnestly entreat M. Baudrillart to fly from the doctrines of Cieszkowski as from the plague.

BAZARD AMAND. Born on the 19th September, 1791, was one of the founders of *carbonarism* in France. In 1815, he distinguished himself in the defence of Paris. He then obtained a lucrative appointment in the prefecture of the Seine. Soon afterwards he plunged into politics and secret societies, one of which was called *Amis de la vérité*. Bazard was considered as the chief of these societies, which became

dangerous to the throne of the Bourbons. These societies being found out, Bazard hastened to give information to the authorities, which, of course, brought on him the bitterest reproaches from his associates. He then withdrew from these conspiracies, and devoted himself to philosophical pursuits, and adopted the opinions of St. Simon. In 1825 he became one of the editors of their paper, *Le Producteur*. This paper was discontinued in 1826, from want of support, and Bazard and the St. Simonians, determined to elaborate and complete their scheme in private discussion, before giving it to the world. In these discussions, Bazard's talents were so conspicuous, that he became the acknowledged head of the sect. In 1828, the St. Simonians again came before the world by commencing a series of public conferences, and they started a new paper, *L'Organisateur*. The revolution of July, 1830, was a grand opportunity for these social reformers to ventilate their theories, and Bazard became very popular. The sect became so numerous now, that they purchased *le Globe*, a daily paper, which had maintained a struggling existence for some years, which henceforth, during the short remainder of its career, became the organ of their opinions.

Bazard had a rival, Enfantin, in the sect, and although they continued to act for some time together, differences at length broke out, and in 1831, a formal schism took place. Enfantin seems to have been much the more powerful minded man of the two, and Bazard found himself alone. He then commenced a vehement attack on Enfantin, charging him with all sorts of fraud. But he was no match for his adversary, and in a debate in which he was hard pressed by Enfantin, who charged him with inconsistency, he was struck with apoplexy. He retired to Courtry, near Montfermeil, and died there on the 29th July, 1832. The sect was soon afterwards broken up the Government. For an account of the doctrines of the sect, see **SOCIALISM**.

BAZINGHEN, FRANÇOIS ANDRÉ ABBOTT DE, was born 17th July, 1710, at Boulogne-sur-mer, of a family of English origin. He was educated at Paris, and adopted the profession of the law. In 1741, he was appointed judge in the *Cour des Monnaies*, which office he held for 30 years. He then retired to his native town, and took a very active part in promoting local improvements of all sorts, especially in founding an agricultural society. He died at Paris, in 1791. Besides many other writings, he published :

Traité des monnaies, et de la juridiction de la Cour des monnaies, en forme de dictionnaire. Paris, 1764.

This work, the fruit of 20 years' official experience, has always been held in the highest estimation, as one of the most complete on the subject.

—This very celebrated philosopher, one of the great founders of the science of Political Economy in Italy, was born at Milan, on the 15th of March, 1738. He was the son of the Marquis Gian Saverio Beccaria Bonesana, and of Donna Maria Visconti da Rho. The family originally came from Pavia, of which the Beccaria family held the government for a short time in the fourteenth century. He was educated at the Jesuits College at Parma, where he staid eight years. He is described as having been very irregular in his application to work, at one time active enough, but at others, and for the most part, indolent and languid. The fact appears to have been that he was soon disgusted with the frivolous nature of the studies prescribed, the feeble imitation of classical phrases, which was called learning, and the barbarous jargon of the syllogisms, which were misalled argument.

Beccaria being thoroughly unsatisfied with the routine course of study, applied himself to mathematics and philosophy, as the only studies capable of giving vigor and precision to thought, but the current philosophy of the day was as bad and weak as could be. In this state of utter languor and disgust with existing studies, the fame of Montesquieu's *Lettres Persanes*, which were creating an extraordinary sensation in France and Italy, reached him. The freshness and vigor of the French style captivated him: he felt that there was something at last worth reading, and he threw himself with his whole ardor into the works of the French philosophers, D'Alembert, Diderot, Helvetius, and Buffon.

Matters however did not go smoothly with him. The extraordinary ardor with which he embraced the views of the French philosophers highly displeased his parents, and a marriage he made further irritated them. In consequence he had to leave his father's house, and he was thrown upon the world without a profession. At this time he suffered much distress from the uncertainty of his future, which was aggravated by his being naturally of a melancholy and timid disposition.

At this time, fortunately for himself, he became acquainted with a stronger mind than his own, and one more able to buffet with the caprices of fortune—Pietro Verri, who had just returned from the army in Silesia, in 1760, and who afterwards became so famous as an Economist and an administrator. (VERRI, PIETRO.)

Verri soon saw through the character of his friend, that he was a man of uncommon genius and a noble disposition, but of a temperament so melancholic and timid, that he never would have the courage to do anything, without the inspiration of a stronger mind.

Verri therefore endeavoured to think of some plan, by which he might engage Beccaria to appear before the public, and display the ability which he really possessed. A good opportunity soon presented itself. The government of the Milanese had been left in the most disgraceful state by the Spaniards; everything was in disorder, and among other things the bad state of the currency caused universal distress among all traders. Verri himself had commenced those studies in Political Economy which made him afterwards so famous, and he inoculated Beccaria with the subject. The evils of the degraded currency affected every one, and Verri saw that if he could persuade Beccaria to write a good pamphlet on the subject, it would necessarily interest every one, and bring him before the public.

In 1762, accordingly, Beccaria wrote his pamphlet on the *Bad State of the Milanese Currency*, which was printed at Lucca. The result fully answered Verri's expectations. It created a very general interest, and Beccaria's name became at once known to the public. A great controversy immediately arose. The Marquis Carpani, who thought he knew a great deal about the matter, was piqued at Beccaria writing about it, and he published a tract called *Risposta ad un amico sopra le monete*, in which he advocated the very same doctrines that Mr. Lowndes had done under similar circumstances in England (LOWNDES), namely, that in the new coinage, a new valuation of gold and silver should be made, and that the quantity of the metal in the new coin should be conformable to the price of bullion, as rated in the degraded current coins.

On the 21st April, 1762, a proclamation appeared denouncing heavy penalties against all who carried gold and silver out of the state. This was the 88th which had been published since the beginning of the 17th century, but of course like all similar ones everywhere else, it had not the slightest effect. Beccaria's tract appeared in July, 1762, and so low was the state of economical knowledge, that its principles were very generally disputed, just as those of Horner were afterwards in England. Carpani, whose views were refuted in it, as well as several others, attacked him. But he did not want allies; the two Verri supported him, and in a humorous dialogue ridiculed the doctrines of Carpani and the lawyers. In Turin, Beccaria's tract was warmly applauded.

Verri's object was obtained; Beccaria's constitutional timidity was overcome; he had appeared before the public, and had secured attention, if not conviction. A society of young men was formed, among whom, besides Beccaria and the two Verri, was Frisi, the celebrated mathematician, and others. This society started a paper somewhat similar in style to the *Spectator*, and named it *Il Caffè*. It discussed all subjects, philosophical and literary, and soon attained great fame, from the vivacity and genius with which the various subjects were discussed. It lasted from June 1764 to June 1766, and is still considered as the best paper of its kind which has ever appeared in Italy.

But however excellent and spirited the papers in *Il Caffè* were, Beccaria published in 1764 the work which immediately procured him a European reputation, and which has been the chief cause of his fame with posterity. This was his

De' delitti e delle pene, which was published anonymously at Leghorn, in July, 1764. As this work is beyond the scope of our present subject, we cannot of course give any account of it, beyond what affected the author's personal history. It is sufficient to say that its effect was instantaneous. It was already out of print in August; within half a century it went through twenty-eight editions in Italy, and it was translated into twenty-two languages, being more than any other book except the Bible. It excited the warmest admiration throughout the whole world. Lord Mansfield never mentioned the name of the writer without a token of respect. Berne sent him a medal, and all countries vied in doing him honor.

In 1766, he was invited to Paris by all the literary world, along with Pietro Verri. But he was greatly averse to move from his own country. Pietro's public duties prevented him from going, but he strongly urged Beccaria to go, and after great difficulty persuaded him to undertake the journey, and sent his brother Alessandro with him, to strengthen his resolution. At last he started, but when he reached Lyons, his constitutional melancholy so completely overcame him, that nothing would induce him to go on. Pietro Verri wrote to him very strongly to continue his journey, and at last the entreaties of Alessandro prevailed, and he reached Paris, where, of course, he was most warmly received by all the literary society. But all the favor and kindness of the French failed to reconcile him to absence from his own country;—on the contrary, it rather wearied and annoyed him. His melancholy returned stronger than ever, it became a sort of morbid nostalgia, and nothing could keep him from hurrying back to Italy, where he arrived quite unexpectedly, without even stopping to see Voltaire, much to Verri's disgust.

Catherine II., of Russia, was anxious to secure the services of so famous a man as the author of the *De' delitti e delle pene*, and invited him to St. Petersburg, with a promise of suitable employment. Beccaria communicated this offer to Count Firmiani, the Austrian Governor of Lombardy, who was a liberal-minded man. He reported it to the Government at Vienna. Count Kaunitz earnestly desired him not to lose so estimable a man for the country. Not wishing, however, to impede his career, Beccaria was allowed to go to Russia, on the promise that he would return. He decided on remaining at home, and in Nov. 1768, a chair of Political Economy was founded for him in the Palatine school of Milan, under the name of *Scienze Camerali*.

This was the second chair of Political Economy which was founded in Italy, and the third in Europe,—the first being that for Genovesi, at Naples, in 1754 (GENOVESI), and the second, that at Stockholm. Beccaria gave his first lecture on the 9th January, 1769. This was published; but the remainder of the course was unfortunately not published till 1804, in Custodi's collection of the Italian Economists, of which Beccaria's writings form the 11th and 12th volumes of the modern part. As we have given a somewhat full analysis of Beccaria's views, which are extremely interesting, inasmuch as they were delivered several years before the *Wealth of Nations* was published, we shall say no more about them here.

Henceforth Beccaria published nothing, for the last twenty-five years of his life he was of great use in the administration of his country, but he added nothing to the stock of science. In fact, his constitutional timidity prevented him from putting before the public views which would provoke opposition. He himself said that he was willing to be the apostle of humanity, but not its martyr. In April, 1771, he was elected a member of the *Supremo consiglio d'Economia*. This Board having been suppressed, he was appointed a member of the *Magistrato politico-camerale*, with the rank of councillor, and on the 19th January, 1791, a member of the Committee for reforming the system of civil and criminal procedure.

Though he published nothing, the Board of which he was a member, comprising his friends the two Verri, Neri, Carli, and Frisi, effected an entire reform in the administration of the province. Beccaria was frequently called upon for reports upon various subjects. These, with one exception, have not been published, but the Baron Custodi, who was allowed to read them, has pronounced the warmest eulogium upon them. In consequence of one of them the Milanese currency was entirely reformed, and in another he recommended the decimal system of weights and measures, which was afterwards carried out by the French convention.

A stroke of apoplexy carried him off on the 28th November, 1793. He was twice married. By his first wife he left a daughter, and by his second, a son.

Beccaria's economical writings which have been published are:—

Del disordine, e de' rimedj delle monete, nello Stato di Milano, nell' anno 1762.

This excellent little tract was, as above stated, the first Beccaria published, at the request of Verri. It contains a great deal of thoroughly sound doctrine on the subject of money, and value. He saw through the fallacies which so long blinded so many persons in England in 1811, and subsequent years.

He begins by certain definitions, among which are, "Il *valore* è una quantità che misura la stima che fanno gli uomini delle cose."—"Value is a substance which measures the estimation in which men hold things." "Il *conio* fatto al metallo nè aggiunge nè toglie valore alle monete, non altro essendo, che un solenne attestato di che rappresenta la nazione della quantità e finezza del metallo."—"Coining the metal neither adds to, nor takes away from, the value of money, as it is nothing else than a formal attestation which informs the nation of the quantity and fineness of the metal."

Beccaria then bases his arguments on three propositions:—

I. Una equal quantità di metallo dee corrispondere ad un equal numero di lire in ogni moneta.

II. Come il totale di un metallo circolante è al totale dell' altro, così una data parte di un metallo deve essere ad una equal parte dell' altro metallo in ogni moneta.

III. Nello stabilire il valore delle monete, non si dee considerare che la pura quantità di metallo fino, nessun conto facendo nè della lega, nè delle spese del monetaggio, nè della maggiore raffinazione di alcune monete.

Of these propositions the first and third are undoubtedly true. The second, in the terms he has stated it, is as unquestionably false, because it is perfectly well known that the quantity of silver in existence is much more than fifteen times as great as the quantity of gold. The best authorities place it at forty times, though of course it must be to a great extent a matter of conjecture. The true reason why silver being forty times as abundant, is only fifteen times less valuable, is explained in the *THEORY OF PRICES*. Beccaria is opposed to any seigniorage being charged on the coinage. It is strange that so excellent an economist as Beccaria should not have shaken himself free from the notions of the mercantile system. "Questo stato di guerra, in cui Obbes ha creduto essere le genti, si verifica nel commercio e nelle monete, dove ogni nazione cerca d'arricchirsi coll' impoverimento altrui, e combatte più coll' industria, che colli armi."—"That state of war, in which Hobbes believed nations to be, is true in commerce and money, where each nation tries to enrich itself at the expense of every other, and fights rather with industry than with arms." As Beccaria wrote this treatise very young, we need not be too severe upon him for not having emancipated himself from the universal prejudice of his day. He points out the inutility of edicts in regulating the value of money, or anything else. In the second part, Beccaria applies his principles to the circumstances of Milan, and shews that the same era in which tampering with the currency, and the issue of base money took place, was the very one in which Italian commerce declined. He gives some valuable tables of the currencies of different countries. But he had not learnt the doctrine of Locke, that there ought to be only one standard metal. He wished to adopt the medium value of gold and silver throughout Europe; and fix the value of gold to silver at $14\frac{1}{2}$ to 1.

Elementi di Economia Pubblica.

This was the course of lectures delivered by Beccaria in 1769, but not published till 1804, in Custodi's collection of the Italian Economists. It has also been published in the *Classici Italiani*, Milan, 1822, and separately at Florence, in 1854. The opening discourse, or *Prolusione*, was, however, published in 1769, and translated into English. This course derives additional interest from the fact that it was delivered seven years before the publication of the *Wealth of Nations*, and it will be clearly seen, that a very much greater advance had been made in the science of Political Economy, before Adam Smith, than is generally supposed.

Beccaria, in his very excellent discourse, defines Political Economy and Commerce to be the sciences which point out the means of preserving and increasing the wealth of a State, and making the best use of it, and he rejoices that these are now to be made the subject of public discussion. A mistaken prudence had once tried to keep them secret. Free discussion would dissipate a multitude of prejudice, which opposed the truest wisdom. It is of great public utility that these sciences should be generally cultivated. Nor is it sufficient to know general principles only, but minute details. Every Economical action resolves itself into procuring the greatest amount of labor, and services, from the members

of a nation, and in this alone consists the true and original riches, much more than in the quantity of the precious metals, signs only which run to the calls of industry and labor, and which fly from ignorance and indolence, notwithstanding every obstacle.

Beccaria saw that the fundamental conception of Political Economy was *exchange*. "In ogni tempo vi è stato cambio di cose con cose reciprocamente superflue e necessarie, di azioni con cose, di azioni con azioni."—"In every age there has been an exchange of products for products, reciprocally superfluous and necessary, of services for products, and of services for services." This description includes the widest description of property which has been said to be properly included in Political Economy. Beccaria also says that it was necessary to have a multitude of ages, and of minute facts, and experiments upon which to rear the science. He says, that the first seeds of Economic Science in modern times are to be found in Bacon.

In his lectures Beccaria defines Political Economy as above, and defines wealth to be all things useful and agreeable. Everything which serves for food, lodging, and clothing mankind, comes from the earth,—either vegetables, minerals, or animals. The means of making the best use of this he calls Political Agriculture, and forms the first object of Political Economy. These raw materials, however, require to be modified by human labor, to make them fit for human use. This process is called manufacture, and is the second object of Political Economy. As men have usually an abundance of some things greater than they require, and are in want of others, they reciprocally exchange them,—and this is called commerce, the third object of Political Economy.

The labor of men, moreover, requires to be protected from foreign violence, and internal injustice. Hence arises the necessity of fleets and armies, and administrators. These must be supported by taxation. The best mode of levying and applying this is called Finance, and is the fourth object of Political Economy.

The fifth and last object of Political Economy he calls Government, under which are included the sciences, education, good order, public security and peace.

This is the broad outline of what Beccaria considers as the domain of Political Economy; and it will be seen that his opinion coincides very much with that of many influential thinkers at the present day.

We shall now present our readers with a short abstract of Beccaria's mode of treating the subject.

He begins by considering the case of a number of families thrown upon an uncultivated land. They might live for a considerable time on the animals of the water, air, and earth, wild fruits, trees and roots; they might clothe themselves with the skins of animals, and dwell in caves. In process of time, after having tamed many of the wild animals, their own observations, and the wants of the rising generation, would lead them to try to increase the natural productions of the earth. But to do this, they must surmount many obstacles, such as clearing the land, &c., which would require time and instruments.

They must have seeds to plant, and during this time they must have food and clothing. The sum, then, of all things which are necessary to make an uncultivated land fruitful, which are the foundations of culture, and without which the land would remain desert, he calls *CAPITAL*.

The land being thus rendered productive, must be kept so; and this can only be done by reserving from the first year's produce sufficient to replant it, and perform the same operations over again. A portion, therefore, of the preceding year's wealth must be appropriated to reproduction, and this he calls *annual provision*.

He then announces very clearly the doctrine of the *division of labour*, which Adam Smith begins with. "From these families spring necessarily the arts, and the different occupations of men. Each one learns by experience by applying the hand and the mind always to the same kind of works and productions, he finds the results more easy, more abundant, and better, than those which each one would make if each one by himself made everything necessary for himself alone; whence some tend the flocks, some card the wool, some weave it. One cultivates the corn, another makes it into bread; another makes clothes; another builds for the husbandmen and workmen; the arts thus increasing and linking themselves together, and men in this manner dividing themselves into various classes and conditions to their public and private advantage."

The labor of men could not exist without something to work upon, nor could that exist unless the earth produced it. The hand of man modifies and disposes of matter, but does not add one atom to it. But in order that man may work, he must have materials and food, and necessities, during the time of his labor; it thence follows, that the value of every production is composed of the value of the raw material and of the wages of the workman.

These wages are either not paid in money, or they are, but it comes to the same thing, because with money everything can be had. Therefore the true wages are the sum of the necessary and agreeable things the laborer can command. Therefore these wages, or these things necessary and agreeable to life, however they may be modified, all come from the earth. Hence the increase of the products of the earth is an increase of wages to be divided, and the destruction of the same products is a destruction of the same wages.

Hence the object of all economic action is to encourage the greatest possible quantity of useful and exchangeable products, and to remove everything which may diminish this greatest possible quantity.

Agriculture and commerce are inseparably united, the agriculture of one state supports the industry of another, and the industry of the latter enriches the agriculture of the former. Nations, therefore, though separate politically, are in reality united by moral and physical laws. Therefore, in order to obtain the greatest amount of useful and exchangeable products, men must labor diligently on the earth, or upon its products, hence *it is the great end and the first principle of Political Economy to elicit in the natives the greatest amount of useful labor, that is, the labor which produces the greatest amount of exchangeable products.*

The ruling principle then of Political Economy is not to call forth the greatest amount of labor solely, but the greatest amount of useful labor. Every work must be done in the least possible time, and at the least possible expence. As all the laborers must be supported out of the fruits of the earth, the more time and expence any work costs, the more products of the earth must be given for it, and less will remain to encourage other arts and other works. Hence a work will be less useful if it be done by a greater number of persons, and in a longer time, than necessary.

The wants of man are always being renewed by time, and life is supported by the destruction and alteration of matter. He must be clothed, and the tailor must be furnished with all the materials, and he must be maintained while he is working, and those who supply him with materials must be maintained in a similar manner, and so on in succession; hence in every piece of work two elements enter into the price, one the raw materials produced by the earth, and the other the subsistence of all the persons who contribute to its modification. This subsistence is in the first place also supplied by the earth, and it is different from it inasmuch as it is consumed, whereas the other is only worked upon, until it reaches its final destination. In every payment therefore, *i.e.*, in every passage of a product from one hand to another, there is always one part of its value which is turned into immediate consumption. Hence, if the value of the raw material be subtracted from any work, the remainder represents the sum of the things consumed, or the subsistence of all the persons who have contributed directly or indirectly to the work. Hence subsistence or consumption may be said to be the universal representative of all sorts of labor; consumption being a more extensive word than subsistence, as many things must be classed with subsistence which are consumed, and yet are not subsistence, as for instance, wood, which is burnt.

(We may here remark that Beccaria's analysis of price is manifestly defective; if, as he says, price were only composed of raw materials and wages, there could be no such thing as accumulation by commerce. In the language of English economists, Beccaria says that price consists of rent and wages, but Adam Smith shews that price consists of rent, wages, and *profits*, out of which last of course all increase of commercial wealth arises.)

In valuing labor, the length of time it endures must be taken into consideration, because subsistence is a constant want. There must also be considered the greater or less quantity of work done, and the greater or less skill it requires, the dangers and risks in working it, either on account of the fragile nature of the material, or any circumstances which make it noxious or hurtful to health. This refers to the value of the labor, because other considerations affect the value of the thing itself, such as its abundance or scarcity, the greater or less demand, transport, and other things which influence relative value. It is moreover impossible to fix with precision the intrinsic value of the labor of man, on account of the enormous multitude of circumstances to be considered.

But it may generally be deduced that arts among nations are generally in proportion to the demand for them, and to increase the arts, it is

necessary to increase the demand for them, and the means to support them.

Beccaria then enters into a long discussion on population, its distribution, and the progress it makes in different forms of society, and the changes of property. Villages will most abound where the land is in the hands of small proprietors. Population will also depend on the employment which the owners of the land give to their wealth, according to the nature of the government, which however is beyond the scope of Political Economy to examine.

It is most important also, to observe that population has certain natural limits, which it cannot exceed. Man is the result of certain necessary natural products, which come from the earth, and the earth can increase its produce to a certain extent, but not indefinitely. Man, moreover, requires the help of animals, and they too derive their nutriment from the earth. Population increases therefore as much as the means of subsistence increase. And these means increase either by the improvement of agriculture, or by the production of exchangeable goods, by which persons in one place can purchase foreign supplies.

Beccaria then investigates the causes which restrain the increase or diminish population, which are physical and moral. The first of these is a bad climate, or an unhealthy situation; the second is epidemics and diseases. The moral causes are more numerous and difficult to remove. The first is ignorance, and want of civilization. (In Ireland this was a cause of increase.) The second moral cause is the different customs of marriages, which are diminished for different reasons, such as the decreasing value of labor, dissolute habits, moral restraint, excessive luxury in the upper classes, which the inferior ones imitate, the immense disproportion of property from the caprice of testators. The third moral cause is celibacy, overabundance of monks, &c. The fourth cause is that luxury, which supports the less useful classes, at the expence of the more useful ones. The fifth cause is emigration, which arises either from want of subsistence or work, from the weight of taxation, or the excessive levies of soldiers, which the best politicians say ought not to exceed $1\frac{1}{2}$ per cent. The sixth and last cause, is the increase of the towns at the expence of the country, and its arts. Beccaria says that the causes of the diminution of population may be reduced to these heads, and enlarges upon them. He then describes the different modes of estimating the number of the population, and discusses their rates of mortality at considerable length. This concludes the first part of his Elements.

The second part treats of the philosophy of agriculture, which he calls political agriculture, that is the means by which agriculture is improved, its influence on public wealth, the proportion between the produce of the earth, and the arts, and professions, and how obstacles to it may be removed. By political agriculture, he means tilling the earth, pasturage, fishing, the chase, and mining. Beccaria then describes minutely the obstacles which hinder the increase of production in agriculture.

He then enters upon the much disputed question of large and small farms, and enlarges upon the advantages which the advocates of large farms

allege in favor of the system, but he does not pronounce an opinion himself.

He then enters at considerable length into the different kinds of the produce of the earth.

In the next chapter he discusses the various modes proposed for regulating the market, and advocates entire free trade in coin, and shews that the free competition of buyers and sellers only is capable of determining the just value of things. He discusses the various regulating duties proposed by different parties, to insure a supply of corn, and guard against famine, public magazines &c., and shews their inutility, and finally concludes in favor of unlimited free trade, both in the growth and sale of corn, and manufacture of bread. The only edict he says, which is warranted by the true principles of Political Economy is "Let any one who pleases make bread, and how he pleases," private interest will do more for the public advantage than the most rigid laws.

Beccaria then treats of the production of wood for fuel, and strongly advocates the improvement of transport, the construction of canals, and to cheapen the price of it, and says, that forests may, perhaps from their peculiar nature, be subjected to certain regulations, notwithstanding the general rule of absolute free-trade; and examines objections to this interference. He then treats of the culture of silk worms, and other objects of agriculture.

The next subject of investigation is the pastoral department of agriculture, including slaves. He then touches very slightly on mining, fishing, and hunting. On the subject of metals he observes that though it is the object of every man to obtain gold, which gives command of all the pleasures of the earth, yet true politicians have always observed that it is much more advantageous to a nation to be under the necessity of acquiring it, than to possess it in themselves. To acquire it involves movement, action, labor, which is the life and soul of the body political, to possess it in the soil, is a soporific drug to all industry. The possession and working of iron is infinitely preferable to that of gold and silver; and every nation which possesses iron, should diligently work it, as an inexhaustible fountain of all the works of man. Fishing and hunting, too, deserve the regard of the Economist.

The third part of the Elements relates to arts and manufactures. The general course of treatment is very much the same as that of agriculture. He enumerates the different sorts, the obstacles to their increase, such as the dearth and scarcity of labor, excessive taxation, and what is somewhat remarkable, he enumerates among them the custom of persons placing their money in public banks which pay interest, which he seems to think withdraws money from trade, the very same objection as had been made in England to the Bank. Another obstacle is monopoly, and exclusive privileges which are given to one, when many others are ready to undertake the same work. An art which remains in the hands of one, or of few, must always be languid and imperfect, and unable to stand against the competition of similar arts in other countries, where they are free, which produces emulation, goodness of quality, and cheapness; hence demand will always go to a free country, and not to one

where severe monopolies exist. These are always unjust and noxious, either in favor of a new trade or an old one. Those who ask for exclusive privileges want either the power to cheat with impunity, or by the power of the law to tyrannize over the buyer. Free competition in manufactures lowers their price, and improves their quality, and increases their market, which, in the long run, does not diminish individual profits.

Beccaria then considers which of the arts it is most advantageous for a country to have, and the best order of their introduction, and decides in favor of the most necessary ones first, and so on gradually to those of luxury. The objects which a well regulated system of manufactures should aim at, are goodness, variety, and cheapness.

The fourth and last division of his lectures treats of commerce, the most extensive department of the subject.

The different and successive wants of men determined and suggested the different operations devised to satisfy them. Ignorant and savage men who only think of the present, and have no regard for the future, content themselves with very little. Thus the arts and productions of a hunting people are very few. Those of a pastoral people are more and more complicated. Still more so are those of an agricultural people, and productive operations being rendered more easy and more certain, gradually superabundance springs up of things beyond what is necessary to satisfy each one's wants. Thus, if one has a superabundance of one thing more than he wants, and requires something of which some one else has a superabundance, they, reciprocally exchange. Every one finds, too, by experience, that it is easier always to make the same thing, rather than different ones, thus he is induced to multiply the quantity of some single production, to have more than he requires of it, which he can then exchange for other things that he wants, these other things being multiplied with the very same view. Thus commerce is born, and a new era opens up for the refinement and perfection of the human race. And as at first nothing was esteemed except in proportion as it was useful to satisfy the exigencies and comforts of life, from which came the idea and the name of VALUE, that is, it was something which had the power to answer some end, *thus in this last state things began to be esteemed according as they could procure other things.* HENCE ABSOLUTE VALUE BECAME IN CONSEQUENCE RELATIVE, AND EXCHANGEABLE, AND CAME TO SIGNIFY THE POWER WHICH ANY OBJECT HAS TO BE EXCHANGED FOR ALL OTHER THINGS, *and the quantity of anything which must be given for any other, determined, and is called the price of that other.* Hence the first object of this part is the theory of value, and the price of things. From this it came that for certain indispensable and general reasons, that species of merchandize which is most easily exchangeable became the common measure and standard of comparison of all other things, and measures the value of all things. And this common measure is called money. Hence the second object is the theory of money. Competition is the third object. And as commodities, and chiefly money, the universal merchandize and

standard of value, pass from hand to hand, which is called circulation, giving rise to many complicated phenomena, the investigation of these is the fourth object. International trade is the fifth object. From these complicated transactions springs inequality of riches, the sixth object. The seventh object comprises loans and the interest of money. The eighth object is the Foreign Exchanges. The ninth object is the system of banking, and the public funds. The tenth object is public credit, which springs from the last. The eleventh comprises commercial regulations. The last relates to speculation.

Beccaria then enters upon the theory of value and prices. All economic entities, he says, may be called values, which are more or less esteemed, and they are esteemed in the first place according to their capacity to satisfy some human wants; and, secondly, according to their rarity and difficulty of attainment. That is, in modern language, according to the intensity of the demand and the limitation of the supply. Air and water, which are universally diffused, though necessary, have no value, nor has anything, however scarce it is, which is not wanted. But this utility and scarcity are relative, not absolute, for many things have ceased to be useful, because others more useful have been substituted for them, or less expensive. The value of other things, on the contrary, sometimes increases, because new uses are discovered for them.

Beccaria then enters into a minute analysis of the values of different articles,—the word value being invariably used to denote the relative quantities in which objects will exchange, and the causes of the changes of value. He shews that the value will always tend to rise with an increase of demand, and to diminish with the increase of supply, but that there is a fixed point to which the value of things tends to approach, and that point to which the exchangeable value of things gravitates is the labor, or the time necessary to produce them. "Hence," he says, "the value of anything upon which labor is bestowed will increase in proportion to the time necessary to work at it, and if a greater number of persons are employed at the same time on this work, it will also increase in proportion to the number of persons employed on the said work. And to express the said proportions in one sentence, it is sufficient to say that the measure of this value of time and persons will be the subsistence which the said persons consume in the said time." It is natural that every one should estimate the value of his own work by its duration, and that this duration should be valued by the things which the workmen consume.

Thus it will be seen that Beccaria entirely anticipated the doctrine of Adam Smith, and Ricardo, when the one said that the value of things was measured by labor, and the other by cost of production. But he skillfully avoided the errors to which the doctrines of these eminent writers lead; for he shews that though this is the tendency of prices under equal circumstances of production, yet if any could produce cheaper than the rest, these would gain the benefit of the reduced cost of production, until increased competition reduced the price. Being the very doctrine we have maintained in our *Elements*, that no change in cost of production can cause a change of value,

without a change in demand and supply. When there is competition (and Beccaria should have added, an unlimited supply) the price will be fixed by him who can produce cheapest. He then shews that an alleged distinction between extrinsic and intrinsic value was unfounded.

Beccaria then investigates the nature of money, as the merchandize which is always exchangeable, and for that reason is used as a common measure of value. From this definition, there are two principal uses of money, one to be the representative sign of a determinate quantity of everything else, and the other to be a pledge, and a security that the owner can obtain these determinate quantities. In this place, although he has made use of the expression *representative sign*, the same which beguiled John Law, and was the fundamental error of his system, and which Turgot and the early French economists were at so much pains to refute; yet it is perfectly plain that Beccaria's error is only in expression, and not in conception. He fully understood that money is an independent and separate merchandize; and he also saw that its nature is analogous to that of a bill of exchange, namely, a security for a future exchange, which Aristotle saw.

Beccaria then investigates the origin of money, and the reason why gold, silver, and copper came generally to be used as money. These metals enter into commerce exactly in the same way that everything else does, and their value depends, exactly in a similar manner, on supply and demand.

Gold and silver became money because they were merchandize of universal exchangeability. Various circumstances then pointed out the advantage of having them divided by public authority into pieces of equal weight and fineness. Hence coining by public authority, but this coining was only a sign which certified the weight and the fineness of the money.

Beccaria then shows how both silver and gold became money, and were used as measures of each other. He says that, if they were both simultaneously placed in the market, they ought to exchange in the inverse proportions of these quantities, *if the demand for one was not stronger than the demand for the other*. This, however, is the case, and illustrates a principle of very wide application in Political Economy, for whereas the quantity of silver is about 40 to 1 compared to that of gold, its value is about 1 to 15 to gold.

He then enters into the considerations affecting the circulation of gold and silver as money simultaneously, and shews that if they are not valued in the coins according to their market value, the metal which is undervalued will be exported, as has been abundantly verified in numerous countries. He also enters most minutely into the effects of a disordered state of the currency, of which he had a flagrant example in the state of Milan. The phenomena of circulation are then minutely analysed.

Up to the present time only the exchange of material products has been considered, but commerce is a very extensive word, and includes the successive series of exchanges, of all economic services. The definition of commerce as the exchange of the superfluous for the necessary is scarcely exact, and a better definition is the ex-

change of things which are less useful for those that are more useful, the word useful being employed in its primary and general sense, as everything which ministers to our necessities, or wants, or pleasures, physical or moral.

Commerce is usually divided into internal and external. Internal commerce is that made within the boundaries of a state; external, the exchange of anything whatever which is produced, or manufactured, or at least represents any value or any service done by the members of one state with those of another. This distinction, however, only regards the political limits of a state, and immediately affects the sovereign. He then discusses home and foreign trade, in which however we do not think he has been successful, as he thinks that the profit of one man is made at the expense of another.

He points out that an increase of the currency may be hurtful to a nation, as it may drive purchasers away from an increase of price.

The balance of trade, which many people make so much of, is impossible to be ascertained, but there are four signs which, if they happen concurrently, prove that a nation is advancing in wealth. 1. Increase of population. 2. The prosperity and extension of agriculture. 3. The decrease in the rate of interest. 4. A rise in the prices of things in general. These, if they happen altogether, infallibly prove that a nation is advancing in wealth.

Beccaria then discusses the nature of interest. He defines interest as the utility which any person receives from the use of anything, whilst the property of it remains with its owner. Everything may produce such an utility, hence everything may have its appropriate and natural interest. Thus, the interest of the earth, the original function of all wealth, is its constant and periodical reproduction; the interest of labor is the wages paid for it, the interest of personal services, studies, &c., are the fees paid for them, the interest of the manufacturers consists in the gain, they make, deducting the cost of production. The interest of all industry is the profit such industry produces, so long as the workman has the right to employ it. The value of all these things, land, labor, services, manufactures, commerce, is measured by money; consequently, the interest of money is the utility which may arise from this money, as representing each of these values. But he has said that subsistence is the common measure of all these values, and their universal representative. Subsistence is the utility which measures all other utilities, and this utility comes from the earth, hence every sum of money represents some portion of the earth, and the interest of this money represents the annual fruit of the earth. He then details the various kinds of hiring or letting. Hence he says, that the products of the earth are the true measure of the interest of money, and the interest of land compared to the interest of money, is a true rule by which to judge of the prosperity of States. In the course of his following remarks, he seems to have a dim perception of some things which were afterwards propounded in Ricardo's theory of rent.

The subject of the Foreign Exchanges is then very well and ably explained, indeed we do not know of any place where it is done with greater clearness, terseness, and simplicity.

Beccaria then concludes by a short account of public banks, money of account, and credit. This is not so full and satisfactory as might be desired, but he fully bears out the meaning which we have shown to be the fundamental one of BANK under that article. He shows how the public banks arose out of the requirements of governments for money, which they could not raise by direct taxation. Individuals contributed their wealth to one common stock, and received an interest for it. Hence from this origin and definition of public banks, *it follows that the heaping together of wealth is the essential point that forms and characterizes a bank.* But each of the owners of this wealth still retains his right to demand it back again, and consequently he must have an acknowledgment of the bank, which assures to him the property of the value confided to it, and the conditions agreed upon. This assurance is done by registering in a book the names of the depositors, the quality of the deposit, and the conditions upon which it is left, and giving to the owner, a note, or bill, which gives him the right to demand back, or exchange, the sum specified on the face of it. By this means, this note becomes a measure and a pledge of value, just like true and real money. If the owner of money could no longer acquire what he wanted with it, money would be a useless and superfluous thing, thus if a man was rolling in money, if it was not exchangeable for anything else, he would be poor in reality. So also if the owners of these bank notes could not realize their value, they would be no better than paper covered with ink. Their value then consists in the confidence that they can be realized. Consequently a bank should not give out more notes than it has actual wealth to represent them. John Law's system is a fatal example of violating this principle. Beccaria, however, like many other writers, in condemning Law, has not really understood Law's system, and has himself proposed the very same thing.

A very short notice on public credit then finishes the Elements. Beccaria, thus, it will be seen, only investigates three out of the five departments of Political Economy which he had enumerated, and leaves those of finances and government wholly untouched.

Della riduzione delle misure di lunghezza all'uniformità per lo stato di Milano. Relazione presentata al magistrato camerale, il xv Gennajo, MDCCLXXX.

A report to the Board upon the diversity of measures in the State of Milan, in which he recommends their reduction to uniformity, and the establishment of the decimal system, which was afterwards adopted in France, and many other countries.

When we consider that the lectures of which we have given an analysis above, were delivered in 1769, or seven years before the *Wealth of Nations* was published, as well as the writings of other Italians (GENOVESI; VERRI), which were published even earlier, we shall, we think, come to the conclusion that Political Economy had made much greater advances before the days of Adam Smith than is commonly believed. It is by no means uncommon to see it stated that Adam Smith was the founder of Political Economy and the father of Free Trade. But such opinions only proceed from inaccurate historical

knowledge. The fact is, that, as in the early stages of every other science, England was far in arrear of France and Italy. Then, no doubt, by the publication of the *Wealth of Nations*, at one bound she took the lead, and in actual practice, she has since far outstripped every other nation. But there was a much greater number of earnest advocates for free trade, both in France and Italy, before the *Wealth of Nations* was published, than in England. And there were three professorships of Political Economy founded before 1776. One at Naples in 1754, one at Stockholm, and one at Milan in 1768. To suppose, therefore, that Adam Smith was either the father of Free Trade or of Political Economy is a most profound error. We see that Italy is entitled to a very high rank indeed in the science of Political Economy. But Beccaria's name has been comparatively little known in connection with it, and this arose from his constitutional failing. Beccaria was endowed with a great, a piercing, and a generous mind, but it was vastly less beneficial to the human race than it might have been, because it was overshadowed by a most pusillanimous soul. He was not one of those magnanimous spirits for whom the highest order in the ranks of fame is reserved, who will courageously do battle for what they know to be truth, in despite of the opposition of the vulgar of every rank. He was not one of those of whom the poet sings—

"Nè biammo popolar, frale catena,
Spirto d'onore in suo cammin raffrena."

"Nor can the vulgar cry, a feeble chain,
The noble spirit in its course restrain."

His cowardice of spirit greatly lost him the esteem of Verri. Finding the sentiments expressed in his lectures likely to create opposition, he stopped, and left them unfinished, and he never published them. They first saw the light in 1804, in Custodi's collection of the Italian Economists. And thus he has deservedly missed the fame which would otherwise have been his legitimate due.

Usura accommodata, or a ready way to rectify usury. London, 1646.

This little tract contains abundant evidence of the truth of what we have shewn (**BANK**) that the word Bank is the equivalent of *Monte*, or *Mons*. Thus at page 3, he says, "for their rescue may be collected *Mons Pietatis, sive Charitatis*, a *BANKE of Piety, or Charity*, as they of Trent fitly call it." Again, "For borrowers in Trade for their supply, as their occasions shall require, may be erected *Mons Negotiationis*, a *BANKE of Trade*." At page 4, he quotes from Tolet, who speaks of two kinds of Banks, namely, "*Mons Fidei*, a *BANKE of Trust*, which Clement VII. instituted at Rome, he that put his money into this *Banke* was never to take it out again," for which the investor received 7 per cent. interest, like the original Bank of England Stock. He also speaks of a *Mons Recuperationis*, or *BANKE of Recovery*, of which the interest was 12 per cent. The difference between these two was that between perpetual and terminable annuities, where the higher interest of the latter is, in fact, repayment of the capital by instalments. He also speaks of the "*three BANKS at Venice*," meaning thereby the three *monti*, which, as we have shewn (**BANKING AT VENICE**), were consolidated into one management in 1587, and the Commissioners appointed to manage the *BANK* of Venice, then first instituted.

BENTHAM, JEREMY. This preeminent jurist, the great original fountain from whence those beneficent reforms in the law, which are among the most glorious achievements of this age, have sprung, was born on the 15th of February, 1748, in Red Lion Street, Houndsditch. He was the son of an attorney in moderate practice. Though extremely diminutive and feeble in body, he very early displayed signs of great precocity, and his relatives did the utmost they could to spoil him by shewing him off as a youthful prodigy. In 1754, in his seventh year, he was sent to Westminster School, and his Latin verses at eight shew a most remarkable proficiency, at an age when most boys at a public school would be scarcely getting into "nonsense." He was distinguished there for his Latin and Greek composition, but upon the whole he had no great respect for the discipline and method of education then followed at that celebrated seminary.

On the 27th June, 1760, being then only 12½, he was taken up to Oxford to be entered at Queen's College, and at that time he was excused from signing the Thirty-nine Articles on account of his youth. He went up to reside there in the following October. He was so diminutive for his age, as to excite the smiles of the passers by. His residence at Oxford was equally distasteful to him as Westminster had been. His opinion of it was as low as that of Adam Smith, and he spoke against it to the end of his life. In 1763, being then fifteen, he took his B.A. degree, and came to London to enter himself at Lincoln's Inn. In November he returned to Oxford to attend the lectures of Blackstone, but he did not entertain any very high opinion of them, and easily saw through his flimsy fallacies.

His father destined him for the Equity bar, but he had already devoted himself to more discursive studies than are supposed to be agreeable

to so jealous a mistress as Themis. Plenty of work was cut out for the young barrister, but finding one day that it was the rule of the profession to charge fictitious fees in some cases, he took such a disgust to it, that nothing could persuade him to continue in it. He accordingly gave up all idea of practising, and began to speculate on political and juridical subjects, and to collect and compare the opinions of the most eminent writers on them.

His first appearance in print was some letters in defence of Lord Mansfield, in 1770. In 1776, he published anonymously his "Fragment on Governments," being a severe criticism on the doctrines of Blackstone. It made a considerable sensation, and was attributed to several of the most eminent men of the day, such as Lord Mansfield, Lord Camden, and John Dunning. While it was believed to be by one of these celebrated men it had a brisk sale, but his father was so elated with its success that he let out the secret, and as soon as it was known to be by an obscure briefless barrister, the sale fell off. Bentham had prepared a second and much stronger attack on Blackstone, but it was suppressed from fear of a prosecution for libel. The bold audacity of his attacks on established formalism drew down many anathemas on the author, and every violent and ribaldrous pamphlet that appeared was laid to his door.

His "Fragment on Governments" procured him the friendship and patronage of Lord Shelburne, the leader of the Whigs. For many years he was a regular visitor at Bowood, and met there most of the celebrated men of the day. He also corresponded with many of the French philosophers.

In 1785 he was invited to Russia by Prince Potemkin, in whose service his brother, then Colonel, afterwards General Sir Samuel Bentham, then was. Potemkin wished to transplant British civilisation, ready grown, to the South of Russia, and had formed a great establishment at Crichoff. Bentham set himself to collect materials of agricultural, trading, and manufacturing subjects, and left England in August, 1785. He travelled through France, visiting the beautiful Roman antiquities at Nîmes, and the towns in the south, and joined a vessel bound for Smyrna at Nice. He staid nearly a month at Smyrna, and was the first to send home specimens of the Sultana raisin. He then continued his voyage to Constantinople, and from there by land to Crichoff, where he arrived in February, 1787. While staying there he wrote his celebrated *Defence of Usury*, and saw the model of a building devised by his brother for a vast workshop, which he adopted for his Panopticon, a scheme which occupied about twenty years of his life. Bentham had a great taste for botany, and collected a considerable number of the plants of that part of Russia, but he naturally became wearied with the monotony of Crichoff, and in November, 1787, he left it, and returned home by way of Warsaw, Berlin, and the Hague.

His *Defence of Usury* was sent home from Crichoff, and published, and it added greatly to his reputation. He had a great desire to enter Parliament, and from some expressions which fell from Lord Shelburne, he understood that he would put him in for his nomination borough of Calne. But it is probable that Bentham had mis-

conceived the language of his patron. At all events the services of some obscure political lacquey were deemed more important than those of the greatest social philosopher of the age, and Bentham's wishes were disappointed. He felt this very keenly, and it gave rise to a slight temporary coolness between him and his patron.

The miserable administration of the criminal and poor laws engaged Bentham's profound attention for many years. At length he matured a complete scheme of reform. He proposed to unite the management of both in one central board, the criminals to be confined in a building constructed on peculiar principles, so that every part of it should be in the constant view of the superintendent, whence it was called Panopticon. The scheme was taken up with the utmost warmth by Pitt, and all the leading statesmen of the day, and a bill was passed through both Houses of Parliament to carry it out. But Bentham had given offence to George III., and when the bill came up for the Royal assent, the king vetoed it. The last instance probably in our history of the sovereign vetoing a bill, and all the more undignified, as it was done out of pure personal pique. Thus the memory of that monarch stands heavily charged not only with delaying Catholic Emancipation for some 28 years, and thereby bringing the country to the verge of rebellion, but also with delaying the reform of the Poor law for 36 years, at a cost probably of not less than £2,000,000 a year, a tolerably heavy item to place to the debit of his account. Parliament voted Bentham a large compensation for his loss of time and labor, and expenses incurred. In 1831 he published a *History of the War between Jeremy Bentham and George III., by one of the Belligerents*.

The next noticeable event in Bentham's life was his becoming a partner with Robert Owen in the New Lanark mills, situated in the beautiful valley of the Clyde, a little way below the falls of Cora Linn. This establishment was instituted to carry out the Socialist doctrines of its author, and was the first experiment of infant school education, and the abolition of all coercive discipline. The connection is said to have been highly profitable to Bentham.

For some time Bentham had devoted himself exclusively to his meditations on jurisprudence, and social improvement. He took no part in public affairs, but lived like a hermit in his house in Queen Square Place, and received the visits only of a select number of private friends, like his brother oracle Coleridge. These included almost all those who have since been distinguished as leaders of thought among men. But with none of these was his intimacy so great as with James Mill, the famous historian of India, who lived with him for six months every year from 1808 to 1817.

Bentham's fame was much greater on the Continent than in England. His works had been popularized by an excellent French writer, Dumont, who fitted them for the public taste, by expounding them in a familiar style with copious illustrations. In 1825, being troubled with a species of eczema, Bentham was recommended to go to Paris, and consult a French physician. Upon going to the Court of justice, the barristers rose up in a body, and the president seated him at his right hand. He soon after returned to

London, and continued the same peaceful life till the 6th June, 1832, when his spirit passed away with the tranquillity which fitly closed such a life.

It is not, of course, for us to speak here of the gigantic reforms in jurisprudence, which are beyond all question his doing, and that of his immediate disciples. His works have encountered a strange fate, as Mr. John Hill Burton remarks. In his own day they were not read because they were paradoxes, in our day they are not read because they are truisms.

In practical Political Economy his services were immense. He first overthrew the universal folly of the doctrine of the wickedness of interest. He first showed the fallacy of the universal craze for colonies which, in his day, infected all countries, and all statesmen. The recent example of the emancipation of America was an irrefutable example of the truth of his views, which are founded upon the same line of argument as Bastiat's *ce qu'on voit et ce qu'on ne voit pas* (BASTIAT). He also was the first to conceive that immense reform of the Poor Laws, which was only effected in 1834, and which he would have carried out in 1798, if he had not been thwarted by the personal malignity of George III. These achievements are sufficient to entitle him to lasting fame.

But in the theoretical, or more purely scientific part of the subject, he is not entitled to equal praise. Indeed, he was notoriously deficient in the auxiliary sciences which are indispensable to understand it thoroughly. He could not raise himself above the views of Adam Smith, who limited Political Economy to *material* wealth, an error which we have shewn (PRELIMINARY DISCOURSE; CAPITAL; CREDIT) is exactly similar to that of those who, in the days of Galileo, could not believe in the existence of gravity, because it was an incorporeal force; or to those who, in our own day, would deny the existence of the gaseous elements in chemistry, because they are invisible.

Bentham's works were published in 12 volumes, Edinburgh, 1838-43, under the superintendence of Sir John Bowring, one of his literary executors, with the assistance of Mr. John Hill Burton, the historian, who has prefixed an ample but concise introduction to them. For an appreciation of his merits and services, we may refer to Mr. John Stuart Mill's article on him in his *Dissertations and Discussions*.

Defence of Usury; shewing the impolicy of legal restraints in pecuniary bargains. Works, Vol. III., p. 1.

This was the most elaborate treatise which had been given to the world to shew the futility of the prevailing belief in the wrongful nature of usury. Adam Smith had been one of the first to enlighten the world upon the beneficial effect of high prices, and to dissipate the popular fallacy, that they were caused by the wicked conspiracies of farmers and corn-factors. Adam Smith had, however, argued in favor of maintaining the usury laws. Bentham argued in favor of leaving the rate of interest entirely free. This was only accomplished in 1854, when the last remnant of our usury laws was struck out of our statutes. Like all treatises which merely overthrew a current fallacy, it may be considered as somewhat having lost its interest along with its victory.

But all those who love a beautiful piece of argumentation for its own sake, will find pleasure in this treatise.

It is somewhat remarkable, however, that both Adam Smith and Bentham missed the obvious analogy between the variations of prices with respect to commodities, and the variations of the rate of discount with respect to credit, or paper currency.

Manual of Political Economy. Works, Vol. III. A great part of this treatise has lost its interest, as it is devoted to prove the fallacy of the mischievous system of drawbacks and bounties, which were then so generally adopted. He also shews the utter fallacy of the universal belief in the profitable nature of colonies to the mother country. His line of argument is exactly that of Bastiat in his essay, *Ce qu'on voit, et ce qu'on ne voit pas*, in the *Sophismes Economiques*. He shews that for the gain which is apparent, there is to be set off a much greater expense which escapes observation.

Emancipate your colonies; addressed to the National Convention of France in 1793; shewing the uselessness and mischievousness of distant dependencies to an European State. Works, Vol. IV., p. 407.

This, of course, addresses the just-mentioned arguments to the French Convention.

A plan for saving all trouble and expense in the transfer of stock, and for enabling the proprietors to receive their dividends without powers of attorney, or attendance at the Bank of England, by the conversion of stock into note annuities; written in 1800. Works, Vol. III., p. 107.

Bentham proposed to increase the negotiability and convenience of public stock by substituting transferable note annuities (with the interest stated on them) for inscription in the books of the Bank. He hoped that these notes being made small might obtain the same currency as bank notes. It is possible that some convenience might be derived from this plan, though there might perhaps be countervailing disadvantages in the greater facility for forgery. But at all events, Bentham's plan was only to make the existing debt more transferable; he did not propose the monstrous absurdity which is so popular at the present day, of first creating a national debt, and then over and above that, basing bank notes upon its security.

BERGASSE, NICOLAS. A person of very considerable importance in his day, was born at Lyons, in 1750. His family was of Spanish origin, and engaged in commerce at Marseilles and Lyons. Nicolas, however, adopted the law as a profession, and in 1772 was appointed by the magistrates to pronounce a public oration on St. Thomas's Day, an annual custom at Lyons, and again in 1774. He was an admirer of Mesmer's, but that did not prevent him from being a good economist. He acquired great public notoriety by being engaged in some celebrated trials just before the revolution. He earnestly opposed the creation of assignats, and had a strong dislike to banks, and paper money of all sorts. His writings, and his strong opposition to the assignats, drew much hostility upon him, and he became a mark for multitudes of pamphleteers. He was a strong advocate for preserving the constitutional monarchy, and after the execution of Louis XVI. found it time to leave Paris to save his own life. He tried to fly to Spain, but he found the passage of the Pyrenees guarded, and he then went to Tarbes, hoping to escape notice. But he was seized in July, 1794, and taken to Paris. Bergasse saw that to save his life was a match against time, and retarded his journey as much as possible on the plea of illness. By protracting his journey in this way, he just succeeded in saving his life, as the revolution of Thermidor took place just before he reached Paris. He was kept in prison on suspicion of being a royalist, till the peace. He continued his denunciations with great boldness, and was the means of bringing several of the followers of Robespierre to execution. He was released by the Directory, and remained quiet during the empire. At the restoration he was much taken notice of by the allied sovereigns, and was always held in the highest esteem by them. Though attached to the Bourbons, he was opposed to the arbitrary measures of the ministers which brought about the revolution of 1830. That event lost him a pension. He died 28th May, 1832.

BILL BROKER, or BILL DISCOUNTER. It is of the utmost importance in Political Economy to understand the difference between the modes of doing business as a bill broker, or bill discounter, and a banker, as they are universally confounded, and we are not aware of a single economical writer in England since Adam Smith, who has understood it. A bill discounter does business by buying bills of exchange with CASH.

Many, as well, receive deposits at call from the public, and thus they may be described as borrowing from one set of persons to lend to another set. But a banker, as we have seen in the article BANK, buys bills of exchange with CREDIT, and can create credit to a much larger amount than he has cash. He then multiplies credit. Thus the distinction between a bill discounter and a banker is that the first buys debts with cash, and the second with credit; the first adds nothing to the capital of the country, he only puts into greater activity the capital that already exists; the second, as every one who knows the mechanism of banking admits, creates capital, by creating credit, which circulates as money.

The readers of this work may be somewhat surprised to learn that neither Adam Smith, nor any other economical writer in England, nor any of the numerous Committees of Parliament who have sat on Banking during the last sixty years, have had the most distant conception of the ordinary business of banking, or of its effects. And the Report of the last Committee of all, which sat in 1858, shews the most manifest want of knowledge on the subject. Its expressions all refer to the business of bill discounting, and not banking. There is no greater error that infects Political Economy since the expression Balance of Trade, than the general notions of Banking.

A general view of the agriculture of the county of Somerset. London, 1798.

BILL OBLIGATORY, OF CREDIT, or OF DEBT. The names by which were known formerly those instruments of credit which are now called PROMISSORY NOTES.

We have observed that a bill of exchange (BILL OF EXCHANGE) by its very name, *litteræ cambitorie*, denotes an instrument of credit drawn by a person in one country, and addressed to some one in another country. And such an instrument naturally assumed the form of a letter addressed by the creditor to the debtor, directing him to pay a certain sum of money at a certain rate of exchange. The use of these instruments of credit between different countries long preceded the use of instruments of credit within the same nation.

Credit in the form of promissory notes was well known to the Greeks, but we have no evidence that these notes were transferable. These were not made transferable till long after bills of exchange were. About the end of the 16th century the merchants of Amsterdam, Middleburgh, and

Hamburg, and some other places, began to use instruments of credit among themselves, and as the parties came into personal contact, they naturally assumed the form of an acknowledgment of the debt by the debtor, with a promise to pay it to bearer on demand, at the time fixed. These were called bills obligatory, or of debt, or of credit, and were transferable by indorsement in all respects like bills of exchange.

Gerard Malynes, in his *Consuetudo, or, Lex Mercatoria*, gives a very full account of these bills and strongly advocated their introduction into England; but he saw that the Common Law of England, which strictly forbids the transfer of debts, was a bar to it. The first promissory notes introduced were by the goldsmiths, or bankers, but they were not recognized by the law. The first promissory notes recognized by law were those of the Bank of England, which were technically called bills obligatory, or of credit. This name was retained in the Bank of Ireland Act. But this name has now been entirely superseded by that of **PROMISSORY NOTES**, or **BANK NOTES**, which see.

BILL OF EXCHANGE. We have observed (**CREDIT**) that there are two great divisions of instruments of Credit, one in the form of **PROMISES** to pay, which were formerly called Bills of Credit, or of Debt, or Bills Obligatory, but which are now known by the generic name of **PROMISSORY NOTES**, and the other in the form of **ORDERS** to pay, which are chiefly known by the name of Bills of Exchange, which include, also, Letters of Credit, Bankers' Drafts, and Cheques.

2. From the immense magnitude of the transactions carried on in modern times by means of instruments of Credit, a very extensive and subtle branch of law has sprung up, which every Political Economist should master, as an essential portion of his science. In the following article we shall not give any general view of the law of Bills of Exchange, but refer our readers to the works mentioned at the end of it. But there are certain portions of the law which it is indispensably necessary to know, in order to form a true comprehension of their nature, and which involve some of the most subtle conceptions in Political Economy, and these only we shall notice.

3. In its most general form a Bill of Exchange is a letter from one person to another, **ORDERING** him to pay—first, a certain sum of money; secondly, to a certain person; thirdly, at a certain event.

The person who addresses the letter is called the *drawer*, the person to whom it is addressed is called the *drawee*; and the person to whom it is to be paid is called the *payee*.

It is the payee's business, on the first convenient opportunity after he has received the letter, to present it to the drawee, to know if he will pay it; if he consents to do so, it is usual for him to write his name across the face of the bill, and he is then called the *acceptor*.

Now, with respect to the three essentials of the Bill, we may remark:—

1. That though the bill must be expressed to be payable in a fixed and certain sum of money, it is yet forbidden to be the appropriation of any *particular* sum of money, or to be payable out of any *particular fund*. If an instrument were to

be drawn in such a form, it would *not* be a Bill of Exchange. Thus, though a Bill is expressed to be payable in money, it, as well as all other instruments of credit, is **ABSOLUTELY SEVERED** from all connexion with any specific money, and it circulates on the mere belief, or *credit*, that the person by whom it is to be paid, can do so at the appointed time.

Thus we see how it is essentially distinguished from a Bill of Lading (**BILL OF LADING**), which is always the representative of a particular quantity of goods. A Bill of Exchange always circulates in commerce, severed from money. A Bill of Lading is always inseparable from goods.

4. This doctrine of the separate and independent existence of Bills of Exchange and other instruments of credit, and the non-independence of Bills of Lading, is, beyond all question, the great master-subtlety of Political Economy. Its reason and meaning is fully explained in the subsequent part of this article, as well as under **CREDIT**. It is the **PONS ASINORUM** of Political Economy. A confusion on this point has been the cause of some of the most terrible calamities the world ever saw, and is the root of those wild theories of currency of which John Law's is the type. And there is the greater necessity that we should explain and enforce it, as several very able Economists have been beguiled into error, and have adopted the very one of Law.

5. 2ndly. With respect to the person:—

The drawer may make the bill payable either to a third person, or to his order, or to himself, or to his own order.

If the drawer make it payable to himself only, or to a third person only, without inserting the words "or order," the bill can be paid only to the person named, and cannot be transferred to any one else, or cannot be *negotiated*, as it is termed.

If the words "or order" are inserted after the payee's name, he can transfer it to any one else. This is done by writing his name on the back of the bill, hence it is called an *indorsement*, the person who does it is called the *indorser*, and the person to whom it is delivered, is called the *indorsee*.

The indorsement may be either special or general. If the indorser inserts the indorsee's name, and makes it payable to the indorsee's order only, then it can only be transferred or paid by the indorsee's indorsement; and he may transfer it in a similar manner if he pleases, and so on through any number of hands.

But if the first indorsee to whose order it is payable delivers it with his own name only, written on the back, it is called an *indorsement in blank*. Its effect is that it makes the bill transferable by mere delivery, without any farther indorsement, exactly like a bank note, or money; and the bill is then *payable to bearer*, like a bank note.

Formerly, indorsement was in all cases *necessary* to transfer the property in a bill, or note. But in English law this has ceased to be the case though it is so still in the law of some foreign countries. It became the custom of merchants in England, which has long acquired the force of law, that any instrument of credit indorsed in blank, may be transferred by simple delivery, without any further indorsement.

The general rule of English law is now, that if any instrument of credit whatever, whether it be a bank note, or a bill of exchange, be taken in exchange for goods, or money, in any transaction, it is a final closing of that transaction, and the receiver has no remedy against the transferer, if the instrument be not paid. *The payment is in fact in all respects as valid and final as if it were money.*

Except only in the case of fraud, where the payer knew that the banker or person, whose note or bill he tendered, was bankrupt or insolvent.

In the case of bankers' notes issued by persons who were well known in the neighbourhood, the custom of indorsement very soon fell into disuse, though not sanctioned by law, and they are commonly taken without indorsement. But that does not affect the law of the case; it is done at the risk of the taker.

In the case of bills of exchange, it is still the custom to indorse them on a transfer; at least there are very few persons who would take them without indorsement. And the effect of the indorsement is this: that if the bill be not paid by the acceptor at maturity, and if the owner, or holder, of it gives *immediate* notice to any, or all, of the preceding parties on it, he has a claim against them for payment of it.

But this demand for payment must be made without delay, in almost all cases within twenty-four hours after the fact of non-payment is known to the holder. If delay be made in notifying the fact, and demanding payment from the parties liable, they are absolved, and the holder's remedy is gone.

Thus, in modern practice, the indorsement is merely a *limited warranty of soundness*. There is no other difference whatever between selling goods or money for a bill with, or without, indorsement, than between selling any other article, say a horse, a watch, or a carriage with, or without, a limited warranty. It is in all cases a sale. In the cases of a bill taken without indorsement, or a horse bought without a warranty, the sale is final and conclusive; in the case of a bill taken with an indorsement, or a horse bought with a warranty, the sale may be cancelled, if the demand be made within the time limited by the warranty, otherwise it is also final and conclusive.

6. *Srdly*. With respect to the event:—

It must be certain, and not contingent. Thus the bill may be made payable at sight, or on demand, or at a certain time after the date of the bill.

Bills made payable on demand are actually payable on demand. Bills made payable at a certain time after date, were always payable on demand when that time arrived. But in almost every place, certain days were allowed before the holder could commence an action for non-payment of the bill. These were termed *days of grace*, and, by mercantile usage, these days are now in fact incorporated with the bill, and the last day of grace is now held to be the day on which the bill is to be presented and paid. The days of grace vary in different places, but they are usually from three to ten.

7. The usual form of a Bill of Exchange is thus:—

London, January 1, 1860.

£287 15 8.

Three months after date, pay to myself, (or A. B.), or order, the sum of Two hundred and eighty seven pounds, fifteen shillings, and eightpence, value received.

WILLIAM SMITH.

To Mr JOHN COX,
Linen-draper,
Strand,
LONDON.

It is usual in English bills to insert the words "value received," but it is not necessary. In former times it was necessary to state what the debt arose from, whether money or goods. But that has long fallen into disuse in this country.

Such are the essential points of these instruments, which are the mighty moving power of modern commerce. Nothing appears more simple, but, like many other things of great apparent simplicity, they required centuries to bring them to their present state of perfection.

8. *The history of Bills of Exchange.* It is a question which has been much disputed, whether bills of exchange were known to the ancients. Some writers, indeed, and particularly Dupont de Nemours, boldly affirm that they were well known, and used in all the great commercial cities of antiquity, Tyre, Carthage, Corinth, Athens, &c. But as he brings forward no authority for this assertion, we may well be excused from believing it on his *ipse dixit* only. Other writers, however, think that a few passages in Isocrates and in Cicero, are sufficient proof of the fact. These we shall consider shortly.

Credit, indeed, in its simplest form of a direct loan from one person to another, with a promissory note as evidence and security for the debt, was well known both to the Greeks and Romans. We have the very word for a promissory note, *χρηόγραφον*, which was adopted by the Romans as *chirographum*. We also know that the Roman bankers invented the method of paying by cheques. Dealings on credit were also well known at Rome. And by that amusing comedy, the *Pseudolus* of Plautus, we know that a trick, with which our bankruptcy courts are familiar, was known long ago. When Callidorus wants to raise money in his amatory difficulty, Ballio says to him, l. 3. 67.

"Eme die coeca, herole, olivom; id vendito oculata die."

Which very dark sentence the learned interpret to mean, "Buy oil on credit, and sell it for ready money." Thus, in its simplest and rudest form, credit was certainly well known to the ancients. But that great invention, by which debts are made saleable, and credit is brought into commerce like merchandize, and made the great productive power of modern times, was—as far, at least, as we have been able to discover—wholly unknown to the ancients.

9. The only evidence that we have, we believe, that Bills of Exchange were at all known to the ancients, consists in a passage in Isocrates and a few in Cicero.

In the *Trapeziticus* of Isocrates, which is a speech in an action against the banker Pasion for having defrauded one of his customers, he says: "Moreover, Pasion has tried to persuade some people that I had no money at all here, and that

I only borrowed 300 staters from Stratocles. It is therefore worth while to explain this matter, that you may see what arguments he relies on to cheat me of my money. It happened, judges, that Stratocles was just going to sail to Pontus, at the very time when I wanted to bring some money from there. I, therefore, asked him to leave his moffey with me, and that he should receive it from my father in Pontus, thinking it would be a great advantage not to hazard my money in a voyage, at a time when the Lacedæmonians were masters at sea. This I think is no proof at all that I had no money here. On the contrary, my transaction with Stratocles is the very best proof that I had money in his hands. For, when Stratocles asked me who was to pay him his money if my father would not do what was ordered in the letter; or, if he came back here, and did not find me, I took him to Pasion, who promised that he would pay him principal and interest. And will you believe that he would so easily have made himself liable for so much money, if I had had none deposited with him?"

We have quoted this passage at length, because it is the only one, we believe, that was ever brought forward to prove that the Greeks used bills of exchange. And some writers fancy that they can discover in it that the Greeks habitually used them. But we think that it will not warrant any such conclusion. Granting that it does bear a resemblance to drawing a bill on his father at Pontus, the particularity with which it is detailed, seems to us to prove that it was an isolated transaction, which it was necessary to detail at full length to the judges. If the custom of drawing bills on foreign cities were well known, it would have been stated in much shorter terms. Moreover, there is not in the original Greek a single word which bears a technical signification, such as *draft*, or *bill*. To argue that, because on a single occasion a man gives another a letter of credit on his father, and gets his banker to guarantee payment of it, the whole of the intricate system of bills of exchange was known and commonly used by the Greeks, seems to us very much the same as it would be to argue that printing was well known to them, because some single individual may, on some single occasion, have stamped an impression on parchment. The untechnical language, and the particularity with which the transaction is described, seem to us to shew that it was not a usual, or well understood thing. We therefore conclude that what evidence there is, rather tends to prove that the Greeks were wholly unacquainted with the use of bills of exchange.

In Cicero we find several passages which speak of remitting drafts. Thus, *Epist. ad fam. l. to Caninius Salustius*. "Se ait curasse, ut cum quæstu populi pecunia permutaretur" "He says that he has taken care that a draft for the money should be sent (to Rome) along with the people's share of the profit." So when his son is going to Athens he writes to Atticus, xii. 24, "Sed quæro, quod illi opus erit Athenis, permutarine possit, an ipsi ferendum sit."—"But I wish to know whether the money which he will require at Athens can be sent by a draft, or whether he must carry it with him." So also, xv. 15, "Quare velim cures, ut permutetur Athenas, quod sit in annum sumptum ei."—"Wherefore I wish you

to take care to send him a draft at Athens for his yearly expenses." So also, v. 15, "Ut vereor, ne illud quod tecum permutavi, versurâ mihi solvendum sit."—"So that I fear that I must borrow money to pay the draft you changed for me." So also, "Scripseras ut H. S. xii. permutaret."—"You had written that he was to send me a draft, or bill, for 12 sestertia."

M. Nonguiet (*Des lettres de change, &c.*, Vol. I. p. 29) quotes several writers, as Bernier, Savary, Locré, who deny that Bills of Exchange were known to Roman law, in which they, as well as Pothier, who says the same, are undoubtedly right. But some of them also assert, that there is no trace of their existence to be found in Roman, or ancient, manners and customs, but this is, undoubtedly, going too far, as the above extracts from Cicero certainly prove that Bills of Exchange, or drafts, were known and used, to a limited extent. That they do not appear in Roman jurisprudence is no proof that they did not exist in fact. We know, as a fact, that they existed in England for four centuries before any case on them found its way into our law books. It cannot, therefore, we think, be denied that, to a certain extent, they were known to the Romans. For their use in the East, see CURRENCY, PAPER.

10. The period of the invention of bills of exchange in Europe in modern times, is also somewhat obscure. Mr. Fortune, indeed, says that they were in use in 1160, but he does not give any authority for this, and we have not been able to discover any. A host of writers, however, have adopted the conjecture that they were invented by the Jews in 1181, upon their expulsion from France by Philippe Auguste. The Jews were the earliest money-dealers in Christendom, and hence it is natural to ascribe all improvements in money dealings to them. M. Nonguiet quotes the opinion of Cleirac, Savary, Forbonnais, Bernier, Toubeau, Grégoire, Bishop of Blois, Montesquieu, Voltaire, Anquetil, Isambert, Salvador, Merlin, Capefigue, Rigaudier, that bills of exchange were invented by the Jews at that epoch, and adopts that opinion himself.

11. Nevertheless, a critic must not suffer his eyes to be dazzled by the multitudes of conjectures even of eminent men. Conjectures are nothing but conjectures, whatever the number or eminence of the persons may be, who transmit them from one to another. Amongst all these writers, then, as far as we can see, not one has adduced a single fact, or any historical evidence, to support this conjecture. However probable it may be, therefore, that the Jews may have invented them, we must yet try if we can discover any solid basis of facts to help us.

12. Now, in the first place, it appears to us that those writers who have attributed the invention of bills of exchange to the Jews on this occasion, have not well considered the nature of an exchange. They appear to suppose that a body of persons being expelled from a country *en masse*, can transmit their effects by bills of exchange. But this is evidently an error. Bills of exchange arise out of *reciprocal* debts. There must be a retransmission, as well as a transmission, to complete the circuit as we may say. In order that an exchange may exist between any two places, there must be a well organized correspondence, and mutual dealings, which we do not think there

is any evidence to prove existed in those times. Bills of exchange originate out of peaceful dealings and in quiet times, and not in turbulent disorders.

13. In the next place, we must regard the name. The original name for bills of exchange is *litteræ Cambitorie* or money dealers' drafts, in modern phrase, *bankers' drafts*. It is perfectly clear, then, that bills of exchange originated with the *Cambitores*. Now, no one alleges that the *Cambitores* were exclusively Jews. The *Cambitores* were persons who originally kept tables in the cathedrals for the exchange of money of foreigners who came to worship. Now if bills of exchange had originated with the Jews, we should naturally have expected them to be called by some name indicative of their origin. Usury was not permitted to Christians, but it was to Jews, and hence it was called *Judaismus*. Hence, if bills had been invented by the Jews, we might have expected them to be called *litteræ Judaice*, or something of that sort. Now, their name indicates their origin very clearly, and it does not point to the Jews, but to the *Cambitores*.

14. Having thus shewn the persons with whom bills most probably originated, we must next endeavour to find some historical evidence as to when and how they originated.

The power and the arrogance of the Popes had long been increasing, till, in the time of the crusades, they claimed the general power to tax all Christendom to support them, and in process of time they sent their own agents to collect the money. These agents were correspondents of the Italian *Cambitores*. In the middle of the 12th century, the merchants of Florence took up the business of money dealing to a great extent, and their example was soon imitated by other Italian cities, such as Lucca, Sienna, and especially the Lombard cities of Milan, Placentia, and Asti. Cahors, in France, was also remarkable for its monetary transactions. Wherever the Pope's taxes were to be collected, these bankers sent agents to collect the money, and they also advanced money at heavy interest to those who required it. In the countries nearer Rome, these persons were established first. We have the exact date when they first came into England. In 1229, the Pope sent his chaplain Stephen, and a nuncio, into England, to demand a tenth part of all the moveable goods of all persons, lay as well as spiritual, in England, Ireland, and Wales, to support his war against Frederick. A Parliament was held to consider this demand. The foolish king had already agreed to it, but the lay lords indignantly refused to subject their lands to the Pope. The ecclesiastics, however, after considerable grumbling, were obliged to yield, from fear of excommunication. The nuncio then exhibited the letters authorising him to collect these tenths. The strictest valuation was made of church property. Many of the Bishops were obliged to pawn their church ornaments and vessels, and to borrow money at heavy interest from merchants who had come in with the nuncio for this very purpose. These were the Caorsini, or Cahorsini, bankers of Cahors. (*Holinshed, Vol. II. p. 364, Edit. 1807*). These bankers exacted such heavy interest that they excited the people against them. Holinshed says, "This year (1235), the Bishop of London pronounced the sentence of excommunication against certain

usurers, called Caorsini. But because the said usurers shadowed themselves under the pretext of the Pope's merchants (as they named themselves), they prevailed so much by the favor of the Court of Rome, that the said Bishop, being sick and feeble, was cited peremptorily in the parts beyond the seas, before judges chosen forth by the same usurers, to make answer for such high injury as he had done the Pope's factors." In 1251, the Caorsini, who had bought large houses in London, were again attacked. They were cited by the King for taking unlawful usury; some were fined and imprisoned. The rest hid themselves, and at last were allowed to continue their business on paying heavy compositions. The prelates, however, did not dare to attack them, as they were under the protection of the Pope. The Jews rejoiced to see them treated in the same manner as themselves.

15. We need not multiply notices of these persons, which are abundant enough after this date. There is almost an absolute certainty that Bills of Exchange were invented by these persons. We have here what is exactly wanted—a well organised system of correspondence. And Ranke bears out this opinion. He says, (*Geschichte der Römische Päpste Vol. 1, p. 404, Edit. 1838.*) "Wenn man bemerkt hat das die Wechselgeschäfte des Mittelalters ihre Ausbildung hauptsächlich der Natur der päpstlichen Einkünfte verdankten, die in aller Welt fällig, von allen Seiten an die Curie zu übermachen waren."—"As it has been observed that the business of exchange, or banking, in the middle ages, received its chief extension from the nature of the papal revenues, which, falling due throughout the world, had to be remitted from all quarters to the Curia."

16. M. Nonguer cites the *Statutum Avenionense* of 1243, *de litteris cambii*, and also from Nicolai de Passeribus, a law of Venice, in 1272, *de litteris cambii*. Now if they were merely a secret invention of the Jews, we cannot think that they would so soon have become known to their enemies, or been publicly recognised by them.

17. Hence we see, that originally a bill of exchange was a banker's draft, addressed from a person in one country to some one in another, whose business it was to exchange foreign money. From these persons it naturally spread to commerce, but at what time does not appear. The oldest bill of exchange known to exist is quoted from Baldo by Nonguer. It was drawn probably in 1390, in the following terms :—"Al nome de Dio, Amen. A di primo di Febuario MCCCLXXXI, pagate per questa prima lettera ad usanza, da voi medesimo libre 43 de' grossi, sono per cambio de' ducati 440, che questi chi hane ricevuto da Sejo el Compagni attramente le pagate." Another is quoted by Capmany of 1404, which was drawn by a Luccese merchant of Bruges on his correspondent at Barcelona, and negotiated by him in Bruges. When the bill was presented for payment in Barcelona it was dishonoured. In neither of these bills are there any words of negotiability, yet we find that one was negotiated, whence we may conclude that the practice of negotiating them sprung up long before it was recognised on their face.

18. The time when bills were made negotiable has been much disputed. Several authors attribute it to Cardinal Richelieu, 1620—1642.

And in this opinion M. Nonguier agrees. But if it is meant to affirm by this that Richelieu first made instruments of credit assignable, this is clearly a mistake. For in a bill of exchange quoted by Lawson (*History of Banking*, p. 38) of the date 1589, the power of negotiability is inserted in it. "Witnesseth this present bill of exchange, that I, Robert Anderson, merchant of the city of Bristowe, do owe unto Thomas Mun, merchant of the said city, the sum of 100 ducats; I say 100 ducats of current money of Spain, accounting after 11 rials of plate to the ducat, to be paid unto the said Thomas Mun, or his assigns, 10 days after, &c." It is remarkable, however, that Malynes, in 1622, says (p. 270, *Edit.* 1686).—"Neither can you make a bill of exchange payable to the bearer, or bringer thereof, (as you make your bills obligatory beyond the seas,) to avoid the inconvenience which might happen in derogation of the nobleness of the said bill of exchange, which every merchant is to maintain." But in the forms of bills given by Marius, writing in 1654, the words "or assigns," and "or order," are introduced in the bill. Moreover, Malynes, in his *Lex Mercatoria*, (1622), gives a full account of the bills of credit, which had been long used in Holland which were payable to bearer.

19. For a long time bills of exchange were confined to what their name indicated, namely—bills drawn in one country to be paid in the money of another. The Common Law of England, which inflexibly forbade the assignment of a debt, was of course a bar to their introduction into England. But the custom with respect to foreign bills was adopted by it, to facilitate foreign trade. It was long before the transfer of internal debts was adopted. At last it was adopted between London and York, and London and Bristol. Thus the custom of inland bills of exchange began. But it was still confined to different towns, and for a long time it was essential that a bill should be drawn in one town upon another. At last transferable bills were introduced between persons in the same town, or between wholesale dealers and retail dealers, and these did not assume the form of bills of credit, as we should expect they naturally would have done, as in Holland; but they still retained the form of a bill of exchange, as that was already tolerated by law. Thus by striking off one limitation after another, they have gradually become what they are now, merely an *order* from one person to another to pay money, and they have thus lost all trace of their etymological origin.

20. Having thus traced the origin and history of Bills of Exchange, and explained their legal essentials, we shall now proceed to investigate their nature, and the functions they perform in Political Economy. We shall also shew in what they resemble, and in what they differ from, Bills of Lading.

21. Several very able writers on Political Economy, seeing that Bills of Exchange are expressed to be payable in money, and that they circulate by indorsement, which transfers the right to demand the money they are said to represent; and, also, seeing that Bills of Lading are given in reference to certain goods, and that they circulate by indorsement, and transfer the right to demand certain goods, have drawn the conclusion that they are of the same nature, and

are to be classed together. They even give them the name of *fictitious*, or *representative* values, in opposition to money, as a real value, and they define credit to be the mobilisation of fixed property. The same writers, admitting that money is not a sign, or representative of value, but an independent substantive article of value.

22. Nevertheless, this is an error of the most fatal nature. It is one of the most momentous consequence in Political Economy. It is just one of those examples, which are to be met with in so many sciences, in which deceptive superficial resemblances are to be carefully guarded against; and for the true analogy we must penetrate deep below the surface, and we shall find it beneath a seeming opposition.

23. Money and instruments of credit are homogeneous—they are not *signs* or *representatives* of value, but independent substantive entities.

Bills of Exchange and Bills of Lading are *not* homogeneous. Bills of Exchange are independent entities; Bills of Lading are not independent entities, but only signs or representatives of value. Bills of Exchange are *not* signs or representatives of value.

24. In order to explain this clearly, we must shortly state the changes of opinion which have prevailed with respect to the nature of money.

When men began to speculate on the nature of money in modern times, they adopted what is called the Mercantile System. They thought that gold and silver were the *only* species of wealth, and that the only way to enrich a nation was to heap up as much gold and silver as possible. The fable of Midas is an exemplification of this craze.

No sooner were men convinced of the folly of this opinion than they rushed into the opposite extreme. They then denied that money was wealth at all. They considered wealth exclusively to consist in commodities; and because they were to be had in exchange for money, they considered money to be merely the *sign* or *representative* of wealth, or value. They then said that as money was merely the *sign* of wealth, that it was of no consequence what material it was made of. They then considered that it might be made of any material of no value, such as paper, and that as much money might be created as would represent all the wealth in the country. They maintained that so long as it *represented* some article of value it could not be depreciated. This was the basis of Law's theory of money, which proposed to create a paper currency to *represent* all the land in the kingdom. The history of experiments, founded on this doctrine, may be seen in the articles *ASSIGNATS*, and *BANKING IN FRANCE*, in this Dictionary. This idea is also at the root of those false theories of credit which are so prevalent at the present day, of mobilising all the property of the country, and coining the public funds into paper currency.

25. Midas and John Law are, therefore, the two poles of currency crazes. Turgot was the person who recalled the world to sober sense. He shewed that money was neither exclusively wealth, nor was it nothing, or only a *sign* of wealth. He shewed that money was simply an article of value, like any other article, and that it was not a *sign* of wealth, but an independent value, just as

anything else was. And this doctrine, that money was simply an article of independent value, became the corner-stone of true Political Economy.

26. But though this doctrine of Turgot's was an immense step gained, still he did not obtain the fundamental conception of the nature of money. For though it is true, it does not explain the true function that money performs in economy, it does not shew *how much* money is required. Aristotle, in former times, obtained the true conception (ARISTOTLE). He observes that Society is held together by mutual exchanges of services. When two services performed are equivalents, there is no need of money. But if a person does a service to another, and requires no immediate service in return, he requires something that will enable him to obtain that service at some future time, when he may require it. This conception, as we have shewn (CURRENCY), has also been seen by other writers, and especially by Bastiat (BASTIAT), and it is the basis of our own theory of money. Hence, leaving out of consideration at present, how money is obtained, and the quantity of it required to perform any particular duty, we obtain this great fundamental conception, that money is the representative of services due to the owner of it. It is the proof and the measure of services having been performed by the owner of it, for which he has received no equivalent service. And J. B. Say means exactly the same thing when he says that a sale is a demi-exchange. (SAY, JEAN BAPTISTE). Hence we see that money is in its nature general credit, as Burke called it, (BURKE,) or a general bill of exchange, as Adam Smith calls it. (SMITH, ADAM). Hence money is the proof of past services, it is the *representative of DEBT*.

27. Now we have shewn under CREDIT, that as the future productivity of the earth is an economical element, which may be bought and sold; so also the future productivity of each individual is, too, an economical element, which may be bought and sold. It may be brought into commerce, like any other merchandize, and the portion of it which is brought into commerce is called credit, and is usually represented by bills of exchange.

28. Thus, not only may a man trade with money which is the fruit of his past services, but also, he may trade with his expectation of performing future services. Now, as we have shewn that each man's *future* productivity is an economical element, it must be capable of being *measured*. And the unit of measurement is his capacity to pay £100 one year hence. Thus a trader's promise to pay £100 one year hence is the unit adopted in measuring his credit; and this is bought and sold in commerce just in the same way as a pound of butter, or a quarter of corn. The price, however, is expressed somewhat differently. When a commodity is bought, the quantity of money given for the article is named. When debts are bought, it is usual to mention the difference between the money paid and the amount of the debt, and this is called the *discount*. Thus, if a banker, or bill broker, buys a merchant's promise to pay £100 one year hence for £97, it is said to be £3 per cent. discount.

29. Now, when a person sells goods, or does a service to another, and receives money in payment, it is quite evident, as several eminent eco-

nomists have seen, that it is only a demi-exchange. The person who receives the money has not received any equivalent service in return, but only the right of demanding one at some future time from any trader he pleases. Thus he has received an instrument of *general* power.

Now, let us suppose that, instead of money, he receives a bill of exchange for the goods sold or the service done, it is quite clear that he is in the same position as in the former case, so far as this: he has done a service, the value of which is measured by the sum promised to be paid on the face of the bill, and which he may demand at the specified time from the specified person.

Hence it is quite clear that in the hands of the *holder* of the money or bill, they denote exactly the same thing. They are the proof, the measure, and the record of services due to him for services performed. The difference is that one is a *general* power, and the other a *special* or *particular* power. But it is quite clear that they are homogeneous in this:—they both *represent debt*, and not any particular goods or commodities, although they are exchangeable for them.

29. Thus in the hands of the holder they are each independent substantive entities, and are reckoned separately in the amount of his property. Thus even Mr. Thornton (*Inquiry into the nature and effects of paper credit*, p. 20), in enumerating the capital of merchants, includes in it "*debts due to our traders for goods sold and delivered by them.*" Thus it is fully admitted by Mr. Thornton, that an instrument of credit is capital when in the hands of the holder. This, one would imagine, admits that credit is capital. But so far from admitting the general proposition that credit is capital, he strenuously denies it.

The common argument used to shew that credit is not capital is this, as given by Mr. Thornton: "Paper constitutes, it is true, an article on the credit side of the books of some men, but it forms an exactly equal item on the debit side of the books of other men. It constitutes, therefore, on the whole, neither a debt nor a credit." Therefore it is *nothing*.

30. Now this argument looks somewhat specious, but let us investigate it a little closer. Suppose John Smith sells a horse to William Robins, but does not deliver it, and lets it stand in his stables. Now let each of them make up his books. It is quite clear that William Robins would add the horse to what he had, and John Smith would subtract the horse from what he had. Therefore the horse would stand as a credit in one man's book, and a debt in another's book, therefore the horse is *nothing*!

31. In fact the error is a very specious one, but it is one of the greatest importance, and demands explanation.

The argument is that as soon as a merchant has accepted a bill at three months, say, he is in debt, and the bill must be subtracted from his property.

This is a great error in fact and in law.

If a farmer takes a farm, and agrees to pay a yearly rent for it, he may be considered as having accepted a series of bills payable annually. But no one would ever say that because a farmer has agreed to pay rent a year hence, that he is in debt at the present time, and that that rent is to be subtracted from the present amount of his property, or that it is any diminution of his property.

It is quite clear that the future rents stipulated to be paid, are meant to be paid out of *future profits*, which are yet to be produced.

32. The merchant who buys goods at three months' credit, and accepts a bill, is just in the same position as the farmer. He is *not in debt*. If a landlord were to sue a tenant for rent due a year hence, he would be laughed at. So if any one were to sue a merchant on a bill not payable for three months, he would lose his suit. It is a well recognized rule of law, that *credit unexpired may be pleaded under the general issue*, which, being interpreted in the vulgar tongue, means that a man is not in debt until the time for payment arrives.

33. The error is easily explained by reference to the difference between Arithmetic and Algebra. Let us suppose that a man were to set off to walk from London to Brighton, and we were told that he had walked (15—10) miles to Brighton. If we were to consider the matter simply in an arithmetical point of view, we should say that he had merely walked five miles towards Brighton, and that was all he had walked. If it was said that that he had walked (10—15) miles to Brighton, it would in Arithmetic be sheer nonsense, as there are no absolute negative quantities in Arithmetic.

34.—But if we look at it in an Algebraical view, the case is very different. For then + and — merely mean opposite directions, or opposite qualities. If we were to interpret the expression that a man had walked (15—10) miles towards Brighton, it would mean that he had walked fifteen miles *towards* Brighton, and ten miles *back* again *from* Brighton. The result would be the same as in the former case, he would be five miles nearer Brighton than when he started, but he would have actually walked twenty-five miles. So if we were to say that he had walked (10—15) miles to Brighton, that would mean, Algebraically, that he had walked ten miles towards Brighton, and then fifteen miles in the opposite direction. That is, he would have passed through London and gone five miles on the other side. He would then be five miles further off from Brighton than when he started, still having actually walked twenty-five miles.

35. Thus, in Physical Science, the signs + and — are used to mean any opposites, no matter what. If a line drawn in one direction is positive, then one drawn in the opposite direction is negative. If a force pulling in one direction is positive, then a force pulling in the opposite direction is negative, and so on through all opposites; and especially, in Physical Science, *if time past is positive, TIME FUTURE IS NEGATIVE*.

36. In Arithmetic, absolute negative quantities have no existence, but in Physical Science negative quantities have a real existence, and are independent entities, just as much as positive ones. In Physical Science quantities extend on both sides of zero to infinity, the one side positive and the other negative, but both equally real.

37. These views furnish us with a manifest solution of the points we are discussing. If money, which represents a past exchange, or past service rendered, is positive, an instrument of credit, which is negative, represents a service to be rendered, or an exchange which is *to be made*. And this has a real existence, and is an economical

element, just as much as the former. Thus Political Economy, like Physical Science, deals with positive and negative quantities; the former representing past time, the other future time, both having equally a real existence.

38. Thus if a merchant buys goods for £75 at three months' credit, which he expects to sell at £100, his property would be estimated thus—
£100 — £75.

which, being interpreted according to the way we have been illustrating, means that he has made an exchange for £100, and that he is bound to make a future exchange for £75. Now it may be true that the net result to him is, that he is worth £25, but yet it is quite clear that the £100, and the £75 are each separate and independent elements, and must be reckoned so.

39. We now see the analogy between Political Economy treated on the conception of Exchanges and Physical Science. A bill of exchange has a real independent existence exactly analogous to negative quantities in Physical Science. It is an independent entity, which may be exchanged just like any other commodity. If money, which is positive, represents the past productivity of the individual, a bill of exchange, which is negative, represents his future productivity.

40. We now see at once why it is contrary to the very nature of a bill of exchange to *represent*, or be *appropriated* to any specific goods or money, as a bill of lading does. Over and above the actual quantity of goods, the future productivity of every merchant is an economical element, which may be bought and sold as any other merchandise, and that is represented in commerce by bills of exchange. And thus the fundamental analogy between money and instruments of credit is clearly apparent; as well as the fundamental distinction between bills of exchange and bills of lading.

41. And this furnishes at once the solution of the false analogy which deluded Law, and so many others since. He saw that a merchant's obligations might greatly exceed the quantity of his cash, and therefore he thought that as the instrument of credit only *represented* money, that other paper instruments might *represent* any other material wealth. Paper instruments of credit in this country exceed the cash many times, but an attempt to coin only a portion of the land of France into paper money produced the most gigantic convulsions (Assignats). The cause of it is extremely plain; credit is independent property, and, like many other species of property, may greatly exceed in quantity the amount of cash. The value of the land in England many times exceeds the quantity of cash, so also the public funds, and shares, and stocks of all sorts. And they only maintain their value by a certain portion of each being offered in exchange at any time.

42. There is also a further curious analogy between the opinion of early Algebraists, and those of Political Economists. It is very common for the latter to call instruments of credit *fictional* values, as opposed to money, which they call a *real* value. The early Algebraists gave the very same name to negative quantities, when they were first discovered. Every one knows that Algebra grew out of Arithmetic by substituting general symbols for figures. The inventors of it

found that they had constructed a machine much more powerful than they had thought of, and which, in many cases, brought out results which they could not explain. These were *negative* quantities, which Cardan called *res*, or *æstimationes fictæ*, and they retained this name even so late as Descartes. The very same thing puzzled the Hindoos, among whom Algebra was indigenous. They could not understand the existence of absolute negative quantities. It is now well agreed that they represent merely opposite quantities to positive ones. The very same idea is familiar in book-keeping, where the terms *debtor* and *creditor* are used to signify the opposite operations of money or goods received, and money or goods paid.

44. Hence we arrive at the great doctrine that bills of exchange have an independent real existence, and that they are analogous to negative quantities in Algebra. This doctrine—that bills and notes are independent entities—is perfectly well known to every lawyer. Thus Mr. Justice Byles says, (*Preface to Treatise on the Law of Bills of Exchange*, &c.) “It will not, perhaps, be an unreasonable inference that the bills and notes of all kinds, issued and circulated in the United Kingdom in the space of a single year, amount to many hundred millions, and that this species of property is now, in aggregate value, inferior only to the land, or funded debt of the kingdom.” Now Sir Barnard Byles would never say, nor would any lawyer say, that the property in bills of lading amounted to a large sum, or any sum at all, for the simple reason that they have no separate existence at all, but are mere tickets on the goods they represent, and are part of them, just as the title-deeds to an estate are not separate property, but *part* of it.

45. So also in a merchant's books a bill of exchange is treated and valued like any other merchandize, but no one would ever treat or value a bill of lading as separate merchandize.

One source of confusion arises from the fact, that because bills of exchange are expressed to be payable in money, many persons conclude that they are actually paid in money. Now, under **BANKING** and **CREDIT**, we have shewn that this is a very great error indeed. In London, nineteenth-twentieths of commercial bills are paid *not by cash*, but by the creation of bank Credits. In ordinary cases the system of bills of exchange may go on for ever without payment in any coin whatever, but no one ever supposed that a bill of lading could be extinguished by anything but the delivery of the actual goods.

46. We shall not prolong this article, which has already reached so great a length, but we may refer to the one on **CREDIT**, in which the general doctrine on the subject is more fully explained. This article is meant to be taken in connection with the others on instruments of credit, **BANK NOTE**, **PROMISSORY NOTE**, as well as with **BILL OF LADING**, and **DOCK WARRANT**, for the purpose of exhibiting the fundamental distinction between negotiable instruments, which have a superficial resemblance. See also particularly **BAUDRILLART**; **BOCCARDO**; **CIESZKOWSKI**; **EXCHANGE**; **GARNIER, JOSEPH**; **HILL, EDWIN**; **LAW**.

Des lettres de change et des effets de commerce. By Louis Nonguier. Paris, 1851.

BILL OF LADING. When goods are shipped on board a vessel, it is usual for the master to sign receipts for them in triplicate. These may be sent on to the consignees, resembling, to a certain extent, Bills of Exchange. They may be transferred by indorsement any number of times, and the property of the goods passes with the Bill. From this apparent similarity many writers have drawn the most erroneous conclusion that Bills of Lading and Dock Warrants (**DOCK WARRANTS**) are in all respects analogous to Bills of Exchange, and they call them by the common name of *fictitious*, or *representative* values. But this is an error of the most momentous nature in Political Economy. When goods are delivered to be carried, and the carrier gives a bill of lading for them, no property in the goods passes to the carrier. *It is not an EXCHANGE but a mere BAILMENT.* That is, the property in those very goods remains inseparably associated with the Bill of Lading, and passes along with it, through any number of hands. It resembles exactly the title deeds of an estate. A Bill of Lading is *one* property with the goods. If the carrier, or person to whom the goods are entrusted, should convert them to his own use, he would be a thief. He is merely entrusted with the custody of them for a particular purpose, and his sole duty is to keep them safe, and deliver them to the true owner.

But in the case of a bill of exchange, or any other instrument of credit, the transaction is of a totally different nature. Whenever they are used, the property of the money, or goods, passes to the person to whom they are delivered. Thus, when a man places money in a bank, the property of the money passes to the banker, and he may use it in any way he pleases for his own profit. The property of the note, or receipt he gives for it, passes to the depositor. Thus the money and the receipt or note are absolutely severed, and the instrument becomes **CREDIT**; that is, it circulates because any one who takes it merely *believes* that he can exchange it for money at the proper time. Thus the money and the instrument of credit are *two* properties, and may, and do, circulate independently in commerce. So, when a merchant sells goods, and takes a bill of exchange, the property in the goods passes to the buyer, and the property in the bill of exchange passes to the seller; and the goods and the bill of exchange form *two distinct properties*, which circulate independently in commerce. Thus, in the case of a bill of lading, there is no exchange; in the case of an instrument of credit, there is an exchange. The former represents goods, the latter does not represent goods, but is an independent, exchangeable quantity, like any article

of merchandize. Thus instruments of credit form independent items in the catalogue of the property of the country; bills of lading do not.

This distinction is of the utmost possible consequence in Political Economy; in fact, it is the *PONS ASINORUM* of the subject. It is entirely from a confusion on this point, that Law's theory of money is based. It shews at once the fallacy of that definition of credit, which is becoming so popular on the continent, and has even led astray many able economists, that credit is merely the *mobilisation of property*. That is *LAWISM*. This distinction is further enforced in the series of articles on Credit in this Dictionary, to which we may refer. (*BANK NOTES*; *BILLS OF EXCHANGE*; *BAUDRILLART*; *BOCCARDO*; *CIESZKOWSKI*; *DOCK WARRANT*; *EXCHANGE*; *GARNIER*, *JOSEPH*; *HILL*, *EDWIN*; *LAW*.)

BLANC, JEAN JOSEPH LOUIS. This well-known Historical and Socialist writer was born on the 28th October, 1813, at Madrid, where his father was Inspector-General of Finances to King Joseph. He was educated at Rodez, in the department of Aveyren. In 1830 the revolution deprived his father of the means of supporting his family, and Louis Blanc was thrown upon his own exertions, and maintained himself by private tuition. While in this capacity he wrote for the journals. In 1834 he was appointed sub-editor, and in 1837 editor of the *Bons Sens*. In consequence of a difference of opinion with the proprietor as to whether railroads should be constructed by Government or private enterprise, he and his friends retired from the *Bons Sens*, and in 1839 he founded the *Revue du Progrès Social*, a democratic paper. He became more generally known to the public by his *Histoire de la Révolution*. But what made his name most remarkable was his scheme of Social reform, developed in his *Organisation du travail*, published in 1839. His views are explained under **SOCIALISM**. He was one of the provisional government after the revolution of 1848; and he was allowed to try some of his schemes at the *Ateliers Nationaux*, at the Luxembourg. He was alleged to be concerned in the insurrection of the 15th May, 1848, and the government instituted a prosecution against him, when he thought it prudent to leave the country, and came to London. Napoleon III, after the peace of Villa Franca, published a general amnesty, but Louis Blanc has not thought fit to avail himself of it.

Organisation du travail. Paris, 1839. Numerous editions since.

Le Socialisme, droit au travail. Paris, 1849.

Le catechisme des Socialistes. Paris, 1850.

BLANCARD, P. A merchant captain, born at Marseilles, the 21st April, 1741, and died at Aubagne the 16th March, 1826.

BLANC DE VOLX.

Etat commercial de la France, au commencement du dix-neuvième siècle, ou du commerce français, de ses erreurs, et des améliorations dont il est susceptible. Paris, 1803.

BLANQUI, JEROME ADOLPHE. Was born at Nice, in 1798. In 1825 he was elected

professor of history and industrial economy at the *école spéciale du commerce*, and in 1830 director of that institution. In 1833, he succeeded J. B. Say, as professor of Political Economy at the *Conservatoire des arts et métiers*. In 1838 he was elected a member of the Institute. He travelled very extensively in foreign countries to study their industry. From 1846 to 1848 he represented the Gironde in the Chamber of Deputies. He died recently.

M. Blanqui has published many works on economic science, but he is chiefly known for his *History of Political Economy*.

Voyage d'un Français en Angleterre. Paris, 1824.

Résumé de l'histoire du commerce et de l'industrie. Paris, 1826.

Voyage à Madrid en 1826. Paris, 1826.

Notice sur M. Huskisson et sur sa réforme économique. Paris, 1840.

Du déboisement des montagnes. Paris, 1840.

Précis élémentaire d'économie politique, précédé d'une introduction historique, et suivi d'une biographie des économistes, d'un catalogue et d'un vocabulaire analytique. Paris, 1842.

Histoire de l'exposition des produits de l'industrie française en 1827. Paris, 1827.

Notice sur la vie et les ouvrages de J. B. Say. Paris, 1840.

Les classes ouvrières en France. Paris, 1848.

Histoire d'économie politique en Europe, depuis les anciens jusqu'à nos jours; suivie d'une bibliographie raisonnée de principaux ouvrages d'économie politique. Paris.

This is the work by which Blanqui is best known to the general public. It is one of the first connected accounts of the history of the science of Political Economy, and abounds with valuable details. But it is rather notices of the authors who have written on Political Economy, than a history of the science itself, at least according to our notion of what the history of Political Economy should be. The history of Political Economy should be the history of *ideas*, rather than of authors.

BOCCARDO, GEROLAMO. Professor of Political Economy in the University of Turin.

Trattato Teorico-practico di Economia Politica. Torino, 1853.

This is the most extensive treatise on Political Economy which has appeared in Italy in recent times. Professor Boccardo does not profess to make any new discoveries in Political Economy, but only to explain the science as generally understood. He is firmly convinced that it is to be classed along with the physical sciences, and to be studied in the same manner. The first book treats of the production of wealth; the second of the division of labor and exchange. The third of the theory of value and exchange. In this Boccardo maintains that the notion of value depends on, and is inseparable from, that of exchange. "Io so qual valore abbia una cosa quando so con quali e quante altre cose potrò comutarla."—"I know what value a thing has, when I know with what sort and for how many other things, I can exchange it." He also says, "Il secondo corollario già implicito nel precedente, si è che le nozione di valore nulla ha d'assoluto in se medesima. Il valore, noi lo diciamo, non è che un rapporto. Se l'uomo vivesse isolato e senza relazioni coi suoi simili, conoscerebbe bensì l'utilità, ma non il valore delle cose."—"The second corollary is also involved in the preceding, that the notion of value has nothing absolute in itself. Value, we say, is nothing but a relation. If a man lived by himself and without relations with other men, he might recognize the utility, but not the value of things." Boccardo thus ranks in the third school of Political Economy. In this chapter he rejects the law of Ricardo that cost of production regulates value. In the fourth chapter

he discusses the theory of Property. In the fifth chapter he treats of Capital, in which he gives as the definition of it, *Un prodotto risparmiato e destinato alla riproduzione*. "A product saved and destined to re-production." He fully adopts the opinion that intellectual capital is wealth, or as he calls it, *moral capital*. The sixth chapter treats of the Theory of Population. The second book treats of the Distribution of Wealth. In the first chapter he disputes the Ricardian theory of Rent. In the second he discusses the profits and interest of capital. In the third the wages of labor. In the fourth the general laws of the distribution of wealth. The third book treats of the Consumption of Wealth. In the first chapter he has adopted Say's notion that consumption implies the destruction of a value. The second treats of private consumption. The third of public consumption. This part ends with a discussion on free competition. This concludes what he calls the General Division. He next discusses the special divisions at greater length. The first of these is agriculture, the second is manufacturing industry, and the third is commercial industry. In this last part he treats of money and banks, and credit. In the latter subject he has been led into a fatal adoption of the doctrine of Cieszkowski, on the nature of credit. In his Dictionary he classes instruments of credit along with Bills of Lading and Dock Warrants—the very fallacy of Law. The third chapter treats of the modes of transport. He then discusses pauperism and charity, finance, taxation, and public credit.

Manuale di storia del commercio delle industrie, e dell'economia politica ad uso dalle scuole speciali secondarie. Torino, 1858.

This is an excellent manual on the subject, and contains much condensed information.

Dizionario della economia politica e del commercio, così teorico come pratico, utile non solo allo scienziato ed al pubblico amministratore, ma eziandio al commerciante, al banchiere, all'agricoltore, ed al capitalista. Torino, 1857, &c.

This is Professor Boccardo's greatest work. It is a very excellent and comprehensive work on the subject.

BOCER, HEINRICH. Advocate; Professor in the University of Tübingen.

De jure monetarum, tractatus novus. Tübingen, 1614.

An excellent treaty on money and coinage.

BODIN, JEAN. One of the most illustrious men whom France produced in the 16th century, and who, Hallam says, had only Aristotle and Machiavelli as his rivals in Political Philosophy, was born at Angers in 1530. He studied civil law at Toulouse, where he read lectures with great applause, intending to establish himself as professor there. He also composed a work which he dedicated to the citizens, to gain their good will. He, however, changed his mind, and joined the bar of Paris, but met with no great success. This induced him to turn to authorship, in which he gained a great reputation. He must have obtained considerable influence, for he persuaded Charles IX. that the landed proprietors of Normandy had usurped the crown rights, called the *droits des tiers et danger* over the forests of the province. At his instance a royal commission of

inquiry was appointed in 1570, to which he was named king's advocate, to recover possession of the crown rights. Bodin prepared proceedings against four hundred families, there being scarcely one who was not attacked. The whole province was of course in an uproar. The Parliament and the nobility sent deputations to the king, and at last persuaded him to abandon the attempt to recover the crown rights. Bodin strenuously opposed the registration of this edict, but the proprietors of Normandy prevailed.

In 1568 he published his valuable work on the coinage, to refute the fallacies of Malestroict, which is full of important details of prices.

In 1571 the Duc d'Alençon, the king's brother, who had a great esteem for him, made him secretary of his commands, one of the masters of requests of his palace, and chief justice of his province.

In 1574, Henry III. succeeded to the throne. He was very fond of the company of men of genius and learning. He sent for Bodin, and was greatly pleased with him, as he had remarkable conversational powers. The king imprisoned an author who had written a libel on Bodin, and forbade him to publish it.

On the 25th February, 1576, Bodin married Frances Trouillart, sister of the king's advocate in the bailiwick and presidential court of Laon, and was elected to represent the *tiers état* in the States of Blois. In this capacity he was a sturdy supporter of the rights of the people, and resisted an edict which was proposed to compel every one to adopt the Catholic faith. He maintained that it was a violation of their rights, and would certainly provoke a civil war. His opposition, however, was fruitless in that fanatical age. He also maintained that the king had no right to levy taxes without the consent of the people. In the same year he published his famous work, "The Republic." It is said that this brought him into serious danger of his life, and that he was condemned to be burnt as an avowed Atheist, because he maintained in it that liberty of conscience ought to be granted to dissenters. At all events, his boldness and courage lost him the favor of the king.

In 1579, the Duc d'Alençon was created Duc d'Anjou, and aspired to the hand of our virgin Queen. Leicester was in disgrace, and the Duke, thinking it a good opportunity to push his suit, suddenly presented himself at Greenwich, with scarcely an attendant. The Queen's vanity was tickled, and she seems to have given him encouragement to prosecute his suit. Negotiations were continued, and in 1582 matters had proceeded so far, that the marriage treaty was actually concluded between the commissioners of England and France. But the Queen left herself a loop-hole of escape. It was provided that the marriage should be solemnized six weeks after the ratification of the treaty, and the adjustment of certain other matters between the Queen and the Duke. The Queen took care that these other certain matters should not be adjusted, and perplexed everybody with her interminable caprice. To cut short this shilly-shallying, the Duke came over himself, with a splendid retinue. He took Bodin with him as his secretary. He was received with great state and princely hospitality. After being fooled for two months, he

went away, raving at the perfidy of islanders and women.

Bodin found that his Republic had been received with great favour in England. It had been translated into the Latin of the barbarous insulars, and lectures were read on it in London and Cambridge. Bodin translated it into civilised Latin, to present it in a proper dress. The Duke died in 1584, after an unsuccessful attempt in the Netherlands to destroy the liberty of a province, and Bodin was left without a protector. He seems, after this, to have discharged the duty of King's advocate at Laon, and died there of the plague in 1596. He was buried in the church of the Franciscans, in that city.

Bodin was the most liberal and enlightened political writer of the day. He was the advocate of that well-moderated and glorious constitutional liberty which is the peculiar blessing of this country. He maintained a firm and judicious mean between the tyranny of despotism and the licence of democracy; and as usual in such cases, he displeased the partisans of both extremes. He was a noble assertor of the rights of conscience, and sacrificed his own advancement to the fearless assertion of his opinions.

It is a melancholy instance, however, of the infirmity of human judgment, that this eminent person, so far in advance of his age in constitutional and religious liberty, was a firm believer in witchcraft and sorcery! Wierus, a physician of the Netherlands, had written a treatise *de Præstigiis* in 1564, combatting the horrible prejudice of the age, by which ugly old women were burnt as witches. Even he, however, did not venture to deny the fact of witchcraft. He only urged for them the plea that they were the devil's victims, and not his voluntary agents. In 1578 Bodin wrote a work *de la Demonomanie des Sorciers*, stoutly supporting the reality of witchcraft, and calling for judicial punishment on Wierus as a confederate of Satan!

M. Baudrillart, the colleague of M. Chevalier in the chair of Political Economy at the Collège de France, has recently published a work in two volumes, *Bodin et son temps*, for which he was awarded a prize by the Institute of France, in 1853. (BAUDELLART.)

Les six livres de la République. Paris, 1576.

The sixth book of the Republic contains discussions on the public revenues, taxation, and the coinage. Among many other valuable notices, he says, that the value of gold and silver had diminished 10 or 12 times since the discovery of the Peruvian mines. That the Chancellor of France, in the time of St. Louis, had for the charge of himself, his horses and servants, seven sous (or shillings) of Paris, allowed him a day, which was not equal to 8d. of his day. That Charles V. of France paid 31,000 crowns for the county of Auxerre, Philip I. paid 60,000 crowns for the duchy of Berri, and that many earldoms, baronies, and great seigneuries, had been sold, 120 years previously, for the twentieth part of what they brought in his day. That the revenues of France in 1449, in the days of Charles VI., were 40,000 pounds sterling, which was equal to 1,400,000 pounds sterling of his day. He also says, that by the advice of the Cardinal of Tournon, Francis I., in 1543, instituted a bank at Lyons, at which every man received 8 per

cent. for his money, in which multitudes of people in France, Germany, and Italy, invested their money. At his death Francis I. owed the bank 500,000 crowns. His son Henry, having wasted his father's treasure, paid 10, 12, and 16 per cent. in 1554, which was the same rate as Charles V. of Germany, and Henry VIII. of England, had borrowed at. He also gives many interesting financial details of other countries. In the third chapter he discusses the subject of money.

Discours sur le rehaussement et diminution des monnoyes, tant d'or que d'argent, et le moyen d'y remédier; et response aux paradoxes de Monsieur de Malestroict. Paris, 1578.

This tract is full of the most valuable details of the changes that had occurred in prices in France during the three preceding centuries. Malestroict, the master of accounts and of the mint, had asserted the extraordinary paradox that during three centuries prices had not risen in France. Bodin takes an immense variety of articles and shews that they had risen from five to ten fold in price during the three preceding centuries; he investigates the causes of this diminution in the value of the precious metals.

BECKH, AUGUSTE. This eminent philologist was born at Carlsruhe the 24th November, 1785. He was educated at Halle and Berlin. In 1805 he was appointed extraordinary professor of philology at Heidelberg, and in 1811 he was appointed professor of classical literature at Berlin.

Die Staatshaushaltung der Athener. Berlin, 1817.

This excellent work has been translated into English by Sir George Cornwall Lewis, Bart., M.P., under the title of "*The Public Economy of Athens*." It contains the fullest and best account we have of the Political Economy of the Athenians. The first book discusses the prices of commodities, the wages of labor, the rent of land and houses, and the profits of stock in Attica. The second discusses the financial administration and expenditure of Athens. The third details the ordinary revenues of Athens. The fourth treats of the extraordinary revenues, the valuation of property, the public loans, alterations in the coinage, and the financial expedients adopted by Grecian states in times of difficulty. A dissertation on the silver mines of Laurion, in Attica, is appended to the work.

Professor Böckh has also written a work on the weights, coins, and measures of Antiquity, called,

Metrolologische Untersuchungen über Gewichte, Münzfüsse und Masse des Alterthums in ihrem Zusammenhange. Berlin, 1838.

BECKMANN, JOHN. This eminent man was born at Hoya, in Hanover, in 1739. His father, a receiver of taxes, died when he was scarcely seven years old, and he was brought up by his mother, who gave him the best education that could be procured. He was destined at first for the church, but his turn for natural sciences prevailed, and he devoted himself to them, and especially to their application to economical purposes.

In 1762, Busching, the geographer, who was director of the Lutheran Academy at St. Petersburg, invited him to fill the chair of natural philosophy there. But Busching having resigned, Böckmann left it, and travelled through Sweden to study the working of the mines there. While there he formed a friendship with Linnaeus. In 1766, he was appointed professor at Göttingen, on the recommendation of Busching. He there formed the idea of trying to classify the different arts and branches of commerce. His lectures became extremely popular, and were attended by the most distinguished men in Germany.

Böckmann published many works on his branch of science, but the one he is best known by in this country, is his *History of Inventions*, in which he traces from the earliest antiquity the history of a great number of trades. He occupied his chair for 45 years, and acquired an immense reputation for his learning and personal character. He was elected into almost all the learned societies of Germany. He died the 3rd February, 1811. He left a great number of works, the names of which are given in Messrs. Guillaumin's Dictionary, thus—

Éléments d'économie rurale à l'usage des Allemands. Göttingen, 1769.

Introduction à la technologie ou à la connaissance des arts et métiers, des fabriques et manufactures, particulièrement de celles qui sont en rapport plus direct avec l'agriculture. Göttingen, 1777.

Opuscules relatifs à l'économie politique et domestique, à la technologie, à la police et à l'administration. 1779-90.

Fragments d'une histoire des découvertes dans les arts et les métiers. 1780-1805.

Introduction à la science du commerce, avec l'esquisse d'une bibliothèque de livres de commerce. Francfort, 1792.

Préparation à la connaissance des produits de l'industrie et d'autres objets qui entrent dans le commerce. 1793-1800.

BOESNIER DE L'ORME.

De l'esprit du gouvernement économique. Paris, 1775.

BOETLICHER, JACOB GOTTLIEB IZAAK.

Statistical tables of all the States of Europe. 1800.

BOICERVOISE, F.

Quelques réflexions au sujet du projet de loi relatif aux enfans trouvés. Paris, 1850.

BOISARD, JEAN. A judge in the *Cour des Monnaies*, died in Paris in 1705.

Traité des monnaies, de leur circonstances et dépendances. Paris, 1714.

BOISGUILLEBERT, PIERRE LE PESANT, SIEUR DE. This eminent man may be considered as the morning-star of modern economic science. Very little was known of his works till they were republished in Guillaumin's

Collection des principaux économistes, Vol. I. p. 163, to which M. Eugène Daire has prefixed a short biographical sketch, if indeed it can be called so, where the materials are so scanty.

The place, and the date of his birth, are both unknown. The only notices of his life are in

Saint Simon's memoirs. He was lieutenant-general of the bailiwick of Rouen, and had a brother in the Parliament of Normandy. His work, *Le détail de la France*, was published in 1697, and is the most authentic account of the manners and opinions, and the actual condition of the people of France, and the state of the finances in the reign of Louis XIV. The misery of the people, and the rapacity of the courtiers and statesmen, is exposed in very strong language.

This work, noticed below, is remarkable for its enlightened views. It advocates the suppression of all internal custom houses; absolute freedom of trade in grain, both within and without the kingdom, and only very moderate import duties, and the entire abolition of export duties. These views shew remarkable sagacity; only one of them could be carried out by Turgot some three quarters of a century later; the others have only been, in very recent years indeed, adopted in England, and seem to have very little chance in France for many a long year to come.

This book, so far in advance of its age, attracted very little notice. But not discouraged, he returned to the subject, and in 1707 published the *Factum de France*, which gained more attention from Chamillart, the successor of Pontchartrain. But about the same time Vauban had published his *Dime Royale*, with very much the same views, and this excited great indignation in the mind of the government. Boisguillebert was banished to Auvergne, but soon released, and his work was condemned by a royal edict in 1707. He, however, firmly maintained his opinions. He is supposed to have died about 1714, at Rouen.

Le détail de la France, la cause de la diminution de ses biens, et la facilité du remède, en fournissant en un mois tout l'argent dont le roi a besoin, et enrichissant tout le monde. 1697.

This work details with great minuteness the miseries caused by the unjust method of levying the taxes in France. It explains the evil effects of the obstructions to trade by the internal custom-houses. He shews that the obstacles imposed on the exportation of corn tended to produce a famine, and throw land out of cultivation. He earnestly protests against the dogma of the mercantile system that money is wealth, and almost goes into the opposite extreme, that money is only a sign of wealth; which is an error equally fatal in its consequences, and which Turgot was one of the first to set right. Boisguillebert then maintains (Part III., Chap. vi.) that bad or good government is of as much consequence to the wealth of a country, as the fertility of the soil, or the nature of the climate. He says that the laws of economic science are never violated with impunity, and gives instances of the evil effects of ignorant legislation on this subject. He says that the financiers seem to treat France as an enemy's country, which they do all in their power to ruin.

Factum de la France. 1707.

Maintains the same views as the preceding. In Chap. IV., he discusses the nature of riches, which, he says, consists in the enjoyments of life. He explains the nature and function of money, and shews that paper, parchment, or simple credit is capable of performing its functions. He says that freedom of trade would greatly conduce

to peace. He maintains that there is a *solidarité*, or community of interest, not only between man and man, and province and province of the same state, but also between every state in the world. How far in advance of the wretched theories of the mercantile system, which maintained that one state throve by the miseries of its neighbours! How infinitely in advance of its age!

Traité de la nature, culture, commerce, et intérêt des grains, tant par rapport au public, qu'à toutes les conditions d'un état.

Advocates an entire freedom of trade in corn, such as was before 1650, and to leave all economical laws to the action of nature.

Dissertation sur la nature des richesses, de l'argent, et des tributs, ou l'on découvre la fausse idée qui règne dans le monde à l'égard de ces trois articles.

This is the reaction against the mercantile system, which placed wealth exclusively in the precious metals, and, like most reactions, it goes a little too far, for it goes to prove that money is *nothing*, which finds its logical conclusion in LAWISM. Turgot hit the exact mean between these two opposing theories. Nevertheless he sees very clearly the true function of money is to preserve the right of demanding something, he shews what other things may be substituted for it, among others *credit*, and describes the custom of the fairs at Lyons, where a system prevailed exactly on the plan of our clearing house, (CLEARING HOUSE), when all debts were balanced in paper, and not a single sou of money was required to settle transactions amounting to 80,000,000. This shews that he well understood that money and instruments of credit are homogeneous. He also shews that in commerce both sides must necessarily gain.

No one can read these works of Boisguillebert without admiration of the sagacity they display in that benighted era, nor can we refuse to acknowledge him as the true precursor of that illustrious line of men who have conferred so much benefit on the world. He is a brilliant example of an author whose views are the paradoxes of his own generation, and the acknowledged truths of succeeding ones.

BOISLANDREY, LOUIS DE. A merchant at Versailles, was born in 1749. He was a deputy to the *tiers état* in 1789. He devoted his attention specially to finances, and warmly opposed the creation of two milliards of Assignats, which was proposed by Mirabeau in September, 1790. His views, however, were rejected, and he retired from public life at the end of the session. He died at Paris in November, 1834.

Considérations sur le discrédit des assignats, présentées à l'assemblée nationale. Paris, 1791.

Examen des principes les plus favorables aux progrès de l'agriculture, des manufactures, et du commerce de France. Paris, 1815.

Clave de los economistas, en el poder y en la oposizion, discurso económico-político. Madrid, 1850.

BONCERF, PAUL. Born, about 1745, at Chasaulx, in Franche-Comté. An advocate before the parliament of Besançon. His merit procured him an appointment in the office of Turgot. While in this office he published his work on feudal rights, in 1776, which created a vehement uproar, and, upon the motion of the Prince de Conti, was ordered by the parliament to be burnt, and the author was about to be prosecuted, when the king forbade them to interfere in the matter. This prosecution, of course, gained for Boncerf and his work fame and popularity; it was translated into several languages. It served as the basis of the decrees of the constituent assembly in 1789. He died in 1794.

Les inconvénients des droits féodaux. Paris, 1776.

Mémoire sur cette question; Quelles sont les causes les plus ordinaires de l'émigration des gens de la campagne vers les grands villes, et quelles seraient les moyens d'y remédier? Paris, 1784.

Thoughts on the Value to Great Britain of Commerce in general, and on the value and importance of the Colonial Trade in particular. London, 1808.

Practical observations on the Report of the Bullion Committee. London, 1810.

This pamphlet is only remarkable as having called forth a most able and crushing reply from Ricardo. Mr. Bosanquet endeavoured to prove by figures that the principles of the Bullion Report were erroneous. Ricardo replied, taking the whole of Mr. Bosanquet's figures to pieces, and shewing, that when they were rectified, they proved most satisfactorily the truth of the Report. It is also curious as having proposed for the monetary unit, the pound sterling, the interest of £33 6s. 8d. of public stock (RICARDO).

BOWRING, EDGAR ALFRED. Son of Sir

John Bowring. Has translated the poems of Goethe, Schiller, and Heine. Librarian to the Board of Trade, and Secretary to the Royal Commission for the Exhibition of 1851.

Free trade, and its so called Sophisms. London, 1850.

During the warm economical discussions following Sir Robert Peel's great reforms, a "barrister," generally supposed to be Mr. Justice Byles, published a little volume, entitled the "*Sophisms of Free Trade*," somewhat after the manner of Bastiat's *Sophismes économiques*. Mr. Bowring's work is a reply to it.

BOWRING, SIR JOHN, LL.D. Was born at Exeter, the 17th October, 1792. He was early

distinguished for his acquirements in the languages of Eastern Europe, and he published metrical versions from Russian, Polish, Servian, and Magyar poems, besides some original pieces. He was an intimate friend of Bentham, who appointed him one of his executors; and he, in conjunction with Mr. John Hill Burton, edited the collection of Bentham's works. In 1825 he became editor of the *Westminster Review*, and contributed largely to it. He has been several times employed by Government to make reports on the commerce of foreign countries. They relate to France, Switzerland, Tuscany, Syria, and the German customs union. He was in Parliament from 1835 to 1837, and again from 1841 to 1849, when he was appointed Consul at Hong Kong. He returned to England in 1853, and in the following year was knighted, and appointed Governor of Hong Kong. During this appointment he paid a visit of state to the King of Siam.

First report on the commercial relations between France and England. 1834.

Second report. 1835.

Report on the commerce and manufactures of Switzerland. 1836.

Report on Egypt and Candia. 1840.

Report on Commercial Statistics of Syria. 1840.

The decimal system in numbers, coins, and accounts, especially with reference to the decimalisation of the Currency and accountancy of the United Kingdom.

BOYD, WALTER. An eminent merchant of London.

A letter to the Right Honorable W. Pitt on the influence of the stoppage of issues in specie at the Bank of England, on the prices of provisions and other commodities. London, 1801.

In 1800 and 1801 there was a great scarcity of coin, and the prices of all kinds of provisions were very high. There was a great demand for specie for exportation, and the market price of gold bullion rose to £4 5s. per ounce, and silver bullion rose to 5s. 7d. per ounce. The exchange with Hamburg fell to 14 per cent. below par. Under these circumstances Mr. Boyd was one of the first to shew, in the above pamphlet, that these were, in fact, proofs of the depreciation of the paper currency, and that the difference between the market and the mint price of gold bullion was the proof and the measure of the depreciation. Lord King also published a treatise to prove the same doctrine (King, Lord). After a short time this difference subsided, till 1809, when exactly the same phenomena recurred, upon which occasion Ricardo first appeared as an author, and gave rise to the appointment of the Bullion Committee. (BULLION REPORT.)

Observations on Lord Grenville's essay on the sinking fund. London, 1828.

Reflections on the financial system of Great Britain. London, 1828.

BRISCOE, JOHN. In the year 1694 there were multitudes of schemes for Banks before the public. One succeeded,—the Bank of England. A knot of persons, among whom the most conspicuous were Asgill (ASGILL) and Briscoe, were very active in getting up an opposition scheme, for the purpose of basing a paper currency on the security of land. The plan which Law took up afterwards. These persons actually got Parliament to pass a Bill for this Land Bank, in 1696; but, fortunately for the country, and all concerned in it, the project totally failed. We have not been able to discover any particulars of this Mr. Briscoe, who was one of the most active promoters of this Bank. (LAND BANK.)

BROUCKERE, CHARLES DE. Born 18th January, 1796, at Bruges. Served in the army from 1815 to 1820, and was a deputy to the States General in 1826. In 1830 he was a member of the congress, then of the chamber of representatives, and successively minister of finance, of the interior, and of war. He afterwards became professor of mathematics and political economy. He has also filled many other offices, and has written many articles in periodicals on economical subjects. He has also published—

Lettre à M. le Comte J. Arrivabene sur la condition des travailleurs. Paris, 1845.

Principes généraux d'économie politique. Brussels, 1851.

BROUGHAM AND VAUX. LORD. The most illustrious of the friends and disciples of Bentham, and to whom, beyond all comparison, the immortal honor is due, of having led the way in the great practical reforms which are the realisation of his ideas, was born in St. Andrew's-Square, Edinburgh, on the 19th September, 1779. To attempt the biography of one who will fill a greater space in the eye of posterity than any man of this age, in the narrow limits to which we are necessarily confined, would be manifestly absurd. To detail his services to Political Economy would be simply to narrate the history of those great economical discussions which, since the great debates on the Currency question, in 1811, have formed so conspicuous a portion of our Parliamentary History. In all of these the name of Brougham will always be found battling in the foremost ranks of enlightenment and truth. He was Attorney-General to Queen Caroline for many years; and Lord Chancellor of England from 1830 to 1834. In 1825 the University of Glasgow honored him by electing him Lord Rector, against Sir Walter Scott, by the casting vote of Sir James Mackintosh. In 1859 the reformed University of Edinburgh honored themselves by electing him their first Chancellor.

Besides innumerable speeches and articles on economical subjects, Lord Brougham published

An inquiry into the Colonial policy of the European powers. Edinburgh, 1803.

BULLION REPORT. This is the name by which the celebrated *Report from the Select Committee on the High Price of Gold Bullion*, in 1810, is commonly known. It forms one of the great land-marks in Political Economy, and deserves the most attentive study from every student in Political Economy. Not, however, that it contains much that is absolutely novel, because the main subject of its inquiry, and the principal doctrines it lays down, had been previously investigated, and solemnly sanctioned by the Parliamentary Committee which sat and reported upon the Irish Exchanges in 1804. The Bullion Report, however, has acquired far greater celebrity than the Irish Exchange Report, and there can be no doubt it is a more able and comprehensive document. Moreover, it embraces more points of discussion—some of them of the first importance—in Political Economy, and diametrically opposed to the doctrine maintained by the supporters of the Bank Act of 1844. It also contains, in one portion, errors of the most important nature, which we shall point out, and another portion contains the only elaborate attempt, that we are aware of, to explain the fallacy of a very subtle theory of paper currency, put forward by Adam Smith, viz., *that if bank notes be issued only on the discount of mercantile bills of undoubted character, and founded on a real transaction, they cannot be excessive*; which was strenuously maintained by many of the mercantile and banking witnesses before the Committees of 1804 and 1810. The immense importance of the subjects discussed in this Report will demand a very full examination from us, and we shall accordingly give, first, a very short sketch of the circumstances which gave rise to the appointment of the Committee; secondly, the different doctrines maintained by the witnesses; thirdly, an analysis of the Report itself; fourthly, an examination of some errors in it; fifthly, an examination of the above-mentioned theory of paper currency.

2. We have shewn (**BANKING IN ENGLAND**, § 142-149), that in the year 1800, from various causes, there was a great exportation of bullion from this country, that the foreign exchanges fell very rapidly to an extent greatly below par, and the market-price of gold, (i.e., the paper price), rose to £4 6s. It was at this time that the doctrine was first discovered in this country, (Dr. Douglas maintained it in America sixty years before), *that the rise of the market—or paper—price of gold above the mint price was the proof that the paper currency was depreciated*. In a year or two, however, the market price fell, and the subject ceased to occupy public attention till 1804, when the banks in Ireland having made the most extravagant issues, the market—or paper—price of guineas rose 10 per cent., and the foreign exchanges fell to an equal amount, which caused the appointment of the Committee on Irish Currency and Exchanges in 1804. This Committee unreservedly adopted and sanctioned the doctrine that the rise of the market price of gold above the mint price was the proof and the measure of the depreciation of the paper currency, and that the issues of bank notes ought to be regulated by the foreign exchanges. In consequence of the strong censure of the Bank of Ireland, expressed by this Committee, it reduced its issues, and the exchange

was nearly rectified. This Report seems to have been soon forgotten, and for several years the paper price of gold stood about £4 the ounce, showing that there was no very sensible depreciation.

3. About 1808, however, from various circumstances, the measures of Napoleon to shut out the British from the commerce of the Continent, our own measures of retaliation, the opening of the South American markets, and various other causes, a perfect phrenzy of speculation seized upon the nation. It was one of those great speculative manias, such as there were in 1694, 1720, 1772, 1792, 1825, and 1845. Joint Stock Companies of all descriptions for canals, bridges, insurances, breweries, and multitudes of others, started up like mushrooms. At the same time, the Bank of England fanned the flame of speculation to an extent far beyond the bounds of ordinary rashness. It is stated by Sir Francis Baring, in his evidence before the Bullion Committee, that since the restriction, he knew of many instances of clerks not worth £100, who had started as merchants, and had been allowed to have discount accounts by the Bank, of from £5,000 to £10,000, which demand, he said, was caused by the Bank, and not by the regular demands of trade, and which could not exist if the restriction were removed. The paper discounted by the bank, which had been £2,946,500 in 1795, rose to £15,475,700 in 1809.

4. Along with this extravagant speculation, partly caused by it, and partly fanning it, a multitude of country banks started up in all directions, and inundated the country with their notes, exactly as had happened before 1793; in 1790 they had been reduced to 270, in 1808 they had increased to 600, and in 1810, when the Bullion Committee was appointed, they amounted to 721, and the quantity of paper they had put into circulation, was supposed to amount to £30,000,000. At the same time the Bank of England had increased its issues to £21,000,000—a quantity declared by some of the most eminent witnesses far to exceed the legitimate wants of the country.

5. Concurrently with these extravagant speculations and issues of notes, the price of gold bullion rose rapidly, and the foreign exchanges fell in a similar proportion, exactly the same symptoms as had been manifested in Ireland in 1804. The following figures taken at intervals are sufficient to shew the rapid rise of the price of bullion and the fall in the foreign exchanges:—

	Price of			Exchange with		
	Standard	Gold.	Silver.	Hamburg.	Paris.	
1805. Jan. . .	4	0	0	5	4	35.6 . . 25.10
Oct. . .	4	0	0	5	6	82.10 . . 25.12
1808. Dec. . .	no price		5	5		31.3 . . 22.4
1809. May . .	4	11	0	5	5	29.6 . . 20.1
1810. Jan. . .	4	13	0	5	7	28.6 . . 19.6

Up to 1809 there had been a considerable amount of gold in circulation, but in this year it suddenly disappeared, and no one could tell what had become of it, J. B. Say, however, helps to clear up the difficulty, for he says that in that year upwards of £9,000,000 in guineas were smuggled into the Belgian ports. Mr. Baring stated in the House that guineas then brought 26s. and 27s.; and all commerce was being rapidly

thrown into confusion by the rapid fluctuations of the exchange. Under these circumstances Mr. Horner, on the 1st of February, 1810, moved for several accounts relating to currency and exchanges, and on the 19th the Bullion Committee was appointed, of which Mr. Horner was chairman.

6. As the division of opinion on the financial questions at issue before the committee seems to be as permanent and deep seated as the divisions on political questions, it may be of some advantage to state shortly and precisely the points upon which the respective parties were at issue. The facts upon which the main discussion before the Committee turned, *i.e.*, whether the bank note was depreciated or not, were easily ascertained and agreed upon. They were as follows:—

1.—That the Mint price of gold bullion, or the legal standard of the coin, was £3 17s. 10½d. per oz.

2.—That the market price of gold bullion was then £4 10s. per oz.

3.—That the foreign exchanges had fallen to an enormous amount; that with Hamburg 17 per cent., that with Paris 20 per cent.

4.—That the increase of bank notes had been very great during the last few years, and was rapidly augmenting.

5.—That specie had disappeared from circulation.

7. Upon this acknowledged state of facts the opposite issues maintained by the two parties were as follows:—

The one party maintained—

I. (a) That the bank notes were depreciated.

(b) That the difference between the market, or paper, price of gold bullion, and its mint price, was the measure of the depreciation.

II. (a) That the extreme limit to which the foreign exchanges, could by the nature of things fall, in any case, was defined, and easily ascertained, and consisted of the cost of transporting bullion from one place to another.

(b) That in the then state of the exchanges there was a very large excess of depression over and above that limit, which was not attributable to that cause.

(c) That this residual depression of the foreign exchanges, and the rise of the market price of gold bullion above the mint price, was caused by the excessive issues of bank notes in circulation.

III. That a diminution in the quantity of bank notes would increase the value of the domestic currency—would cause the foreign exchanges to rise to par—and the market price of gold to fall to the mint price.

IV. That the Directors of the Bank of England ought, during the restriction of cash payments, to follow the same rules as they were obliged to do before, *i.e.*, to regulate them by the foreign exchanges. When the exchanges were favorable, and bullion flowing in, they might enlarge them, when the exchanges were adverse they must contract them.

8. In opposition to these principles the other party maintained—

I. (a) That it was not the Bank Notes which were depreciated, but the price of specie that had risen.

(b.) That there was no difference between the price of bullion, whether paid in notes or specie.

PART IV. VOL. I.

II. That the depression of the foreign exchanges was in no way whatever attributable to the depreciation of the currency, but was entirely caused by the adverse balance of payments to be made by Great Britain, the remittances to the army, the continental measures of Napoleon, and other political causes.

III. That no diminution or increase of the issues by the Bank would have any effect whatever upon the foreign exchanges, either in raising or depressing them, or on the market price of bullion.

IV. That since the restriction, there was no necessity for observing the same rules in issuing their notes by discounts, as before, *i.e.*, by observing the course of the foreign exchanges, but that the public demand was the sole criterion. That as long as they confined their issues to the discount of mercantile bills of undoubted solidity, and founded upon real transactions, there could be no over-issue.

9. As to the fact of the rise of the market price of gold, there was no dispute. Mr. Goldsmid, the eminent bullion broker, said that standard gold coin was then £4 10s. the ounce, and foreign gold was still higher, from its being more exportable. It was admitted, by all the witnesses, that the difference between the market and the mint price was about 15 or 16 per cent. The fall of the exchange with Hamburg had been 16 or 17 per cent., that with Paris was rather less. The real question in dispute between the parties was, whether this was to be considered as a fall in the value of the paper, or a rise in the value of gold. Gold had entirely disappeared from circulation within the last six months, and all purchases were made in bank paper. Mr. Merle, a banker and gold refiner, was asked,—

“When you buy gold you pay for it in bank paper?—Yes.

“The payment being made in bank paper, the price is £4 10s. an ounce?—What I sold for the home trade I had only £4 8s. for.

“If you were to pay in guineas, should you get the gold at a cheaper rate?—I could not pay in guineas; I cannot get them.

“Supposing you had guineas to give, could not you buy that gold at a cheaper rate than £4 10s. an ounce?—No; I should not offer a less price, certainly; if I was to buy any quantity of gold, and pay for it in guineas, I should offer the same price as in bank paper.

“When you speak of the mint price being £3 17s. 10½d. an ounce, do you calculate that in gold coin or in bank paper?—We make no difference, and I do not believe that there has been any difference in paying in specie or bank paper.

“Is not the reason why an ounce of gold is worth £3 17s. 10½d., that as many guineas as weigh an ounce amount to that sum?—Yes; if a gentleman came and brought me gold, I should pay him exactly the same, whether I paid him in gold coin or bank notes.

“The mint price of gold is the price calculated in gold coin?—Yes.

“And the market price of gold at present is calculated by paper?—Yes, it is all paid in paper, but if they were to pay guineas, foreign gold would still bear the same price as it does now if the exchange continued the same.

“If I go to a silversmith's shop, and see a gold

cup in weight and fineness exactly 100 guineas, and the silversmith asks me £10 besides for the workmanship, if I offer him £115 for that cup, would not his answer be the gold itself is worth that; would he take £115 in bank notes?—Certainly; for the gold that I sell, I receive bank notes in payment.

"How much would it cost you in bank notes to buy that quantity of gold which in weight and fineness would be equal to 100 guineas?—£105.

"Do not you sell English gold at £4 8s.?—Yes.

"If I go to a silversmith's shop, and see a gold cup in weight and fineness exactly 100 guineas, and the silversmith asks £10 besides for the workmanship, what would the worth of that cup be now?—A cup of equal fineness and weight to 100 guineas, taking the cup at £3 17s. 10½d. an ounce, would be worth £105.

"What is it worth at the present price?—According to the present price of gold, it would be worth £118 2s.

"Would not the silversmith require £118 2s. for the weight of the gold, and £10 besides for the workmanship?—I suppose he would, because gold is so much above the standard price.

"Supposing no legal restrictions to exist, and no scruples to exist in your mind to the making a difference between paper and guineas, and that you were left simply to the calculation of your own interest, could you not in that case make a considerable difference in the sale of any article for £100 in paper, or £100 paid in specie?—Yes; if I was allowed to melt guineas, it would make nearly 10s. an ounce difference to me.

"What difference would you make upon the value of £100?—About half-a-crown upon each guinea; I could afford to sell the gold for 8s. less than I am obliged to do now, if I was allowed to melt guineas."

10. The same witness was asked, "When all guineas were weighed, and the price of gold was about the standard price, £3 17s. 10½d., were guineas frequently refused if they were a fraction of a grain below that?—Yes; when cash was in circulation, they were always refused if they were under 5 dwts. 8 grains, however trifling only, just a move of the scale on the weight side.

"No gold has been seen in circulation lately?—No.

"How long has that been the case?—It has been growing worse every day; but I suppose for the last six months.

"In the six months preceding it, what was the average weight of the good guineas in circulation?—They must have been 5 dwts. 8 grains and upwards.

"How much under the weight at which they came from the mint?—About a grain and a half, as near as can be, lighter than that at which the mint would issue them; the good guineas should be 5 dwts. 8 grains and upwards; if they weigh 5 dwts. 8 grains, we never weigh them more, because they pass current.

"If you could now purchase light guineas at the standard price, what would you do with them, would you melt them down?—Yes, certainly, if they were light.

"You do not take them to the bank or the mint to be melted?—No.

"Can you state the proportion of gold which is

in circulation in ordinary dealings at this time to the proportion of bank notes?—No, I cannot; we see no gold now; my clerks, who are out collecting every day, do not perhaps bring me a seven shilling piece."

11. Mr. Goldsmid was asked, "If a person in possession of 100 guineas, of full weight, were to melt them into bars, and sell them in the market, what sum in Bank of England paper would he be able to obtain for them?—He would have acted illegally in melting the guineas, and his bar would be unsaleable.

"How could the buyer know that that bar was melted from English guineas?—No bar is sold for exportation, unless the proprietor swears before the Court of Aldermen, as I have already said, that it is melted from foreign coin, or from foreign gold in bars.

"Supposing the persons concerned were nevertheless to take that oath, what profit would they obtain upon that transaction?—They would, in the first instance, obtain the profit which arises from the difference between the market and the mint prices of gold; and, in the next place, if they were to export it, they would derive the profit of the export merchant.

"Upon the sum of 100 guineas full weight, how much would the first of those profits amount to in pounds, shillings, and pence?—£15 11s. 6d.

"Then, for 100 guineas melted into a bar, he would have obtained £121 11s. 6d. in Bank of England paper?—Yes.

"If he could for £105 have obtained £121 11s. 6d., and contrive to procure 100 more guineas, would he not have made a profit of £15 11s. 6d. and be in a condition to repeat that operation?—Certainly.

"Does not the same temptation to melt our lighter coin exist in proportion to its approach to full weight?—Certainly it does.

"Is there not a positive temptation to melt all our English gold coin, that is not degraded, for 16 per cent.—Yes.

"Do you think that in the market that person could get the £121 11s. 6d. paid to him for his bar in specie?—The practice of the Bank has always been to pay and receive money in bank notes."

12. Mr. Greffulhe, a general merchant trading to the continent, was asked, "To what do you ascribe the fall of exchange between London and Hamburgh, near 18 per cent.?—Altogether to the commercial situation of this country with the continent, to the circumstance of the imports and payment of subsidies, and having very much exceeded the exports.

"Do you speak of the last two years?—Particularly of the last year; it is only within the last year that the exchange has fallen so much.

"Do you judge of the balance of trade having been against this country in the last year from the state of the exchange, or, from your own knowledge of the excess of the imports above the exports?—I certainly judge of it in a great measure by the state of the exchange, which, according to my apprehension of the subject, can only be influenced by the balance of trade. * * *

"Does your experience, as a merchant dealing in foreign exchanges, enable you to give an opinion whether the excess of paper currency in any country would have any effect in lowering the ex-

change of that country with others?—A forced paper currency certainly would.

"The question goes to an excess of paper currency whether forced or not?—I cannot well conceive a paper currency being permanently excessive unless it is forced.

"But in the case of a paper currency being forced, is it not the circumstance of its thereby becoming excessive, and not the circumstance merely of its being forced, that has a tendency to lower the foreign exchanges?—I conceive it, in the first place, to arise from that paper being excessive; and, in the next place, to that paper representing no real value. * * *

"Do you conceive that an excess of imports above exports can account for the rates of exchange being so high as 16 per cent. against this country for a permanent period of time?—I certainly think so; I conceive the cause of the present state of exchange to be entirely commercial, with the exception, I should add, of the payments which Government have had occasion to make upon the continent, in the shape of subsidies, the payment of troops, &c. * * *

"Supposing the metallic currency of any country should, from any cause, become excessive, and the means of exporting bullion or specie from that country should at the same time be effectually obstructed, do you conceive that such a state of things would tend to create a course of exchange unfavorable to the country so circumstanced?—That surplus of currency would, in my opinion, certainly tend to enhance the price of all commodities, and to depreciate the exchange. But I do not conceive this to be applicable to the Bank paper currency of this kingdom, which, from its nature, and from the manner in which it ought to be, and I believe is issued, can scarcely, in my opinion, be carried to an excess; it is only called forth by the real wants of trade and circulation, and is always represented by a valuable consideration. *I conceive, that as long as bills of undoubted solidity are sent into the Bank for discount, the Bank are fully justified in issuing their notes against these bills, without any fear of the amount of their currency becoming excessive.* The increase in the amount of bank notes in circulation within these few years, is, in my opinion, accounted for, in the first place, by the increased commerce of the country, and in the next place by the increase of the public debt and the consequent taxation, which has the effect of enhancing the prices of all commodities; and the amount of currency required for the purpose of facilitating the exchange of those commodities, or in other words, for trade and circulation, must naturally increase in the same proportion.

"When you say 'Enhance the price of all commodities,' do you include foreign bills of exchange among those commodities?—Certainly not; I am now alluding to the internal concerns of the kingdom, which I conceive to be altogether distinct from its foreign trade.

"Do you, then, conceive, that to whatever extent the Bank affords facility of discount, either to the Government or to individuals, provided the security be good, and payable at fixed dates, that no excess of circulation in bank paper can possibly take place?—I conceive that the wants of the circulation are, of course, confined to a certain sum; whatever proportion of that sum is invested by

the Bank in Government securities will diminish in the same proportion the calls of the public upon the Bank for discounts; the amount of notes, therefore, in circulation will remain the same. The point where, in my opinion, the Bank ought to stop in such purchases of government securities, is when good, responsible bills are no longer sent into the Bank by the public for discount; that I conceive to be a certain sign of the wants of circulation being fully supplied, and any subsequent issue becomes, in my opinion, an excess of paper currency.

"Suppose an advance to be made on goods that may be pledged with the Bank instead of bills, would that, in your opinion, create an excess of circulation?—I conceive it to be highly proper that the securities discounted by the Bank should be payable at short and fixed periods.

"Do you conceive that all that would be requisite to prevent a depreciation of paper currency in any country would be, that such paper should in no instance be issued but as a representative of a good security, payable at a fixed period?—I answer that in the affirmative, certainly.

"Do you conceive that there exists the same security for the public against the inconvenience of an excess of circulation when the payments in cash at the Bank are suspended, as when the Bank was at liberty, and under obligation to make its payments in cash?—I conceive so, if the Bank strictly adhere to the system of discounting no bills but of undoubted solidity, and government securities, the latter with due moderation and the caution pointed out before.

"Are you aware of the practice that prevails among country bankers, with respect to discounts and advances in their paper?—I partly am.

"What is that practice?—The country banks are in the practice, I believe, of issuing notes upon the security of goods, houses, and lands, in addition to the ordinary discount of bills of exchange.

"Of course the security upon which those advances were made is not convertible at any fixed period?—I believe not.

"Do you conceive that from this practice of the country banks an excessive circulation may arise?—I am inclined to think that the system of country banking has been carried too far in this respect.

"Are you of opinion that if the country bankers confine their advances within the same limits as to the description of security which prevails in the Bank of England, that the accommodation afforded by them to the public could not lead to any excess in the circulation?—I believe not. I think the same principle will apply to the country banks, that I applied to the Bank of England.

"Then assuming there to be some excess in the circulation, the cause to which you would ascribe it, is this practice of the country banks?—I am inclined to think so.

"Is it your opinion that there is now, or has been at any time, such excess in the circulation?—I believe at some periods, certainly, too much facility has been shewn by the country banks in the issuing their paper."

13. Mr. Whitmore, the Governor of the Bank, and Mr. Pearse, the Deputy-Governor, being examined, said that, though they adverted to

other circumstances in granting discounts, they never took any notice of the exchanges, as they did not believe that the number of their notes had any connexion with them. Mr. Pearse said, "In considering this subject with reference to the manner in which bank notes are issued, resulting from the applications made for discounts to supply the necessary want of bank notes, by which their issue in amount is so controlled that it can never amount to an excess, I cannot see how the amount of bank notes issued can operate upon the price of bullion, or the state of the exchanges, and, therefore, I am individually of opinion that the price of bullion or the state of the exchanges can never be a reason for lessening the amount of bank-notes to be issued, always understanding the control which I have already described.

Mr. Whitmore. "I am so much of the same opinion, that I never think it necessary to advert to the price of gold, or the state of the exchange on the days on which we make our advances."

14. Being asked what were the rules observed by the Bank in regulating their issues, so that they should not be excessive, he said: "I have already stated that we never forced a bank-note into circulation, and the criterion by which I judge of the exact proportion to be maintained, is, by avoiding, as much as possible, to discount what does not appear to be legitimate mercantile paper. The bank-notes would revert to us if there was a redundancy in circulation, as no one would pay interest for a bank-note that he did not want to make use of."

Mr. Pearse. "I agree in that opinion, and beg to make these additional observations: that in discounting bills that are sent to us for that purpose, for which a discount is taken at the rate of 6 per cent. per annum; if there was with the public an excess of bank-notes, those bills would be sought for discount by the public at a reduced rate, and would not make their appearance at the Bank. We have daily evidence in our discounting of the indications of the abundance or scarcity in the quantity of bank-notes, by the applications for discounts, for the reasons already assigned, which is particularly proved by our experience on the Tuesdays and Wednesdays in every week, in consequence of our discounting London paper on the Thursdays only, producing, by that operation, invariably, a certain degree of scarcity the two preceding days, and a plenty the day following,

"Do you measure the scarcity by the application for the discount of good paper?—Certainly; and our discretion by the quality.

"Then your measure of scarcity or abundance is by the greater or less application that is made to you for the discount of good paper?—Certainly.

"Does not the circumstance of individuals applying for advances, or not so applying, at 5 per cent., indicate rather a deficiency, or a redundancy of the mercantile capital, than a superfluity, or want of circulating medium?

Mr. Pearse. "I am not of opinion that the application for bank-notes is for any other purposes than as a circulating medium in the interchange of property."

"Is it your opinion that the same security would exist against any excess in the issues of

the Bank, if the rate of the discount were reduced from 5 to 4 per cent?

Mr. Whitmore. "The security against an excess of issue would be, I conceive, precisely the same.

Mr. Pearse. "I concur in that answer.

"If it were reduced to 3 per cent?

Mr. Whitmore. "I conceive there would be no difference if our practice remained the same as now, of not forcing a note into circulation.

Mr. Pearse. "I concur in that answer."

"Suppose a case in which no demands were made upon the Bank by Government, but an unusual demand was made by merchants for increased facilities of discount, would the Bank, in such a case, consider itself as bound, in order to support public credit, to grant that increase of discounts, although there was a run upon it for gold, occasioned by the high price of bullion, and the unfavorable state of the exchange?—I now consider my answer as my own opinion, not having the opportunity of consulting the Bank on the question; in my opinion, the Bank would not increase their discounts, nor, on the other hand, would it, I think, after the experience of the years 1796 and 1797, do well materially to diminish them.

"Do you mean that they would lean rather to the side of diminution?—They would rather lean to that side than to the other.

"What do you consider as the result of the experience which the Bank gained in 1796 and 1797, alluded to in your preceding answer?—*The experience the Bank gained in those years was, that if they had persisted in diminishing their discounts to a greater degree than they did, they would have brought on ruin to the mercantile part of the community.*

"Did not the diminution of discounts at those periods create great public distress?—Inasmuch so as I have already stated; *many of the Bank Directors repented of the measure.*

"Was not the drain upon the bank which took place at that time, occasioned chiefly by a demand for an increased quantity of gold in the country, in consequence of the failure of country banks, and a disposition to hoard guineas through the fear of invasion?—To the best of my recollection there was at that period failure of some of the country banks, and that a consequent demand was made upon the bank for guineas."

"Whether or not there was in the end of the year 1796, and the beginning of the year 1797, a considerable diminution of the outstanding notes of the Bank of England?—There was.

"Was not much of the public and commercial distress which arose at that period attributable to that diminution?

Mr. Whitmore. "I have no doubt about it.

Mr. Pearse. "Undoubtedly.

"Whether in your opinion it was not a much wiser measure, relative to the mercantile interests of the country, that the restriction of cash payments should have taken place in 1797, than that the bank should have persevered in diminishing the issue of bank notes in discount?

Mr. Whitmore. "Certainly."

"You have stated that in the case of a drain of cash arising from a foreign demand for gold, accompanied with an unfavorable exchange, at

the time when the bank should be paying in cash, you should advise some limitation of bank paper; do you think that in the event of an equal demand for gold from abroad, accompanied with an equally unfavorable exchange, it would be expedient in like manner to limit the bank paper, although there should result from this state of the exchange no drain upon the bank for guineas, in consequence of the existence of the law authorizing a suspension of the bank payments?

Mr. Whitmore. "In my opinion, the bank would act precisely the same in both cases; with a desire to keep the gold in the country, they would refuse discounts to such parties, as in their opinion would export the bullion equally, whether the restriction was upon them or not?"

Mr. Pearse. "Being of opinion that the amount of bank notes in circulation, controlled as it is by the occasions of the public for internal purposes, cannot influence the rate of the Hamburg exchange, and the consequent export of bullion, (which opinion is borne out by a statement I have already given in,) I should not recommend a diminution of such amount.

"Do you mean to say, that supposing the restriction bill to exist, you should advise some diminution of bank paper, in the event of the long continuance of a very unfavorable exchange with all foreign countries?—Certainly not; because I have stated in a former answer, that from the manner in which the issue of bank notes is controlled, the public will never call for more than is absolutely necessary for their wants.

"Did you not mean in your former answer, that supposing the Bank to pay in cash, and a great drain for cash to arise at a time of a very unfavorable exchange, you should incline to advise some diminution of bank paper, and consequently some restriction of the supply of discounts below the demand that should be made for them?—I must recommend it from necessity, although in my opinion it would not improve the exchange; I think it one of the advantages of the restriction bill, that we are not driven to that necessity.

"Are you not, therefore, of opinion, that the measure of restriction of the cash payments of the bank is proper, not merely as a temporary measure to obviate temporary difficulties, but as a measure of permanent policy?—Although under existing circumstances the restriction bill is found necessary, and experience has proved, as well as I can judge, that no injury results, or is likely to result from it, yet in a different situation of affairs, the necessity for its operation might no longer exist.

"What inconveniences would you see in your view of the operation of the restrictive system, to its being a permanent measure, supposing the bank to regulate its issues in the manner you have described?—From our experience, and in my view of it, I can see no positive inconvenience likely to result from its being a permanent measure, nor do I see any advantage that will arise from its being continued, when our political and commercial relations will admit of its removal; and I am further of opinion, that in addition to the satisfaction, which as a bank director I should derive from the removal of the restriction, (when the necessity for it ceases) the feelings of the

public would not be satisfied, unless it had in expectation such a change.

"Is the restriction of the Bank a cause of the unsteadiness in the course of exchange?—Undoubtedly not.

Mr. Whitmore. "I concur in that answer.

"If a large quantity of metallic circulating medium existed in a country capable of exportation, either in the shape of coin or of bullion, must not that prevent the course of exchange from being much more unfavorable to the country possessing it, than would cover the expenses of exportation?—*Mr. Pearse.* Undoubtedly, but the quantity of bullion in the country for such objects can only depend upon commercial and political transactions, totally unconnected, as far as I can judge, with any effect of the issue of bank-notes.

"Can any paper currency have the same effect?—I think not.

"Since the suspension of the Bank payments in cash down to the present time, has there been any material extension of its commercial discounts?—*Mr. Whitmore.* I find the commercial discounts have varied nearly in the same proportion to the Bank advances upon other securities; the amount of the bank-notes before Parliament is a certain criterion of the aggregate of their advances on different securities to Government; and on all securities the discounts have certainly increased since 1797, owing, as I conceive, to the increased trade of the country.

"Have they increased in a very large proportion?—Within the three last years, they have increased considerably."

"If it were not for this feeling or expectation on the part of the public, should you be of opinion that it would be expedient to continue the restriction as a permanent measure, inasmuch as it would not only relieve the Bank for the expense of purchasing and keeping a large supply of bullion, but also effectually protect both them and the public from a repetition of those inconveniences which first led to the restriction, and that these advantages would be produced without creating any other inconvenience by which they might be counterbalanced?—*Mr. Pearse.* I have already stated, in answer to a former question, that I am not aware of any positive inconvenience resulting from the present operation of the restriction bill, or likely to result from its being rendered permanent, except as far as regards an expectation on the part of the public, that it will be removed.

"Has the present unfavorable state of exchange any influence upon the amount of your issues?—

Mr. Whitmore. "It has no influence upon the amount of our issues, having acted precisely in the same way as we did before.

"Does there, in your opinion, exist any excess in the circulation of the kingdom, arising from the amount of issues of the country banks?—*Mr. Pearse.* I have no practical knowledge of the amount of country bank paper, nor any means of judging of what may be necessary as a circulating medium. There seems to be a great increase within a short time, especially within the last two or three years—greater than I can imagine any alteration of circumstances within that time can legitimately call for.

"Does not all country paper, so long as it con-

tinues out, circulate at par; or, in other words, is it not interchangeable with paper of the Bank of England?—It must circulate at par, or it would return upon the parties that issue it.

"Before the restriction, were not country bankers liable to an extraordinary demand for gold, whenever there was any continued run upon the Bank of England?—Certainly.

Mr. Whitmore. "I agree perfectly with what *Mr. Pearse* says.

"Has the holder of the paper of any country bank any interest to convert it into Bank-notes, if he feels no alarm as to the credit and solidity of the country bank?—*Mr. Pearse.* I should think not.

"Before the restriction, was there not such an interest to exchange country bank paper for gold whenever the market price was materially above the mint price for gold; and did not such an exchange, whenever it took place, lead to a diminution of the circulation?—Although the exchange was often unfavourable to this country previous to the restriction, it was never in my experience sufficiently so to produce such an effect; but as it is now so materially unfavorable, no doubt every exertion would be used to get possession of gold."

"So long as the market price of gold continues to be above £4 per ounce, and the course of exchange with foreign countries in a corresponding degree unfavorable to England, will not the stock of gold in the Bank be continually decreasing by the issues which must unavoidably be made for certain small payments, or for the public service, so that in the course of time, were the present state of things to continue, and the Bank not to purchase at a great loss, the whole would be exhausted?—The purchases made by the Bank have been at a very great loss, and they would think it their duty to sacrifice still more to the public service, to keep up the quantity of specie for the purposes for which it is used."

"Does not the unfavorable course of exchange with foreign countries tend, even under the present restriction, in some degree to render its continuance and prolongation necessary, in so far as that necessity may depend on the proportion of specie in the coffers of the bank to the amount of its notes in circulation?

Mr. Whitmore. "In my opinion the high price of gold bullion abroad, does make it necessary to continue the restriction; but I have already observed that the low state of exchange has not operated before the restriction to drain us of our guineas to any material extent.

Mr. Pearse. "Undoubtedly it does, as far as regards the supply of the public wants with a circulating medium, as it would not be possible for the bank to continue that supply, if the restriction bill were removed, whilst the foreign exchanges remain so unfavorable as at present—a profit of from 10 to 15, to 20 per cent. upon converting guineas into bullion, would be too great a temptation to allow any to remain in the bank, as long as a bank note remained in circulation. The bank would therefore inevitably be driven to the necessity of calling in its notes, or, in other words, of reducing its advances on bills, &c., which would produce that distress, which the restriction bill was passed to prevent.

"In case the Bank was now open, and the exchanges were as they are now, and the price of gold also, should you be of opinion that the Bank ought to restrain the amount of its discounts in consideration of the drain of gold, which would result from these circumstances?

Mr. Whitmore. "If the Bank experienced a drain of gold, they would pay a very great attention to the description of persons to whom they afforded the discounts, and so far their caution would tend to diminish their total amount of discounts.

"When you state that the present high price of gold abroad would occasion a drain upon the bank, and that it was never so high before the restriction, as to occasion such a drain in any material degree; is not the course of exchange with foreign countries the only criterion by which you judge of the high price of gold abroad?

Mr. Whitmore. "The high course of exchange upon foreign countries is not the criterion I judge by, but the notoriety that the gold coin of this country is bought up in order to be exported.

Mr. Pearse. "The course of exchange certainly is the criterion."

"Do you believe that the refusal of the Bank to discount for persons suspected of being concerned in the unlawful traffic of melting down or exporting guineas, would, in point of fact, prevent such unlawful traffic, so long as the market price of gold should continue so high above the mint price, as to afford a profit on the traffic?

Mr. Whitmore. "I believe our refusal to discount tends to lessen though not altogether to prevent it.

Mr. Pearse. "With the best intentions on our part, I am not of opinion that such refusal can prevent it.

"If any period were now fixed upon though a distant one—such for instance as one, two, or three years for the termination of the restriction—should you not be of opinion as a bank director, that it would become necessary for the Bank gradually to diminish the amount of its notes in circulation, and to regulate the amount of its issues, with a reference to the course of exchange with foreign countries; thereby on the one hand guarding as much as possible against any sudden and general embarrassment to the circulation of the country, and on the other preparing itself in such a manner, as might be least likely to produce any derangement of our commerce to meet the opening without any risk of a demand for specie being then made, for the purpose of profit in exporting it to foreign countries?"

Mr. Whitmore. "In my opinion we could not restrain the amount of discounts on the Bank, without so materially affecting the trade and revenue of the country, that it would be advisable to wait the period of peace, when I should hope the question will be considered in the most ample and impartial manner, and that as we may have good reason to expect the demand of gold bullion on the continent would cease, and the trade of the country allow of the importation of the articles, the Bank might be enabled to resume their cash payments without inconvenience, or a prospect of their not being able to continue them.

"Suppose the measure to be determined on by Parliament, of the opening of the Bank at a distant period, should you think that in the event of

the exchanges continuing the same, or nearly the same, some restriction of the Bank issues ought to take place, with a view to prepare for the opening?—Provided it was imperative upon us to open, I should think a restriction of the Bank issues would be necessary, notwithstanding the fatal consequences that might arise from it to the commerce and revenue of the country.

Mr. Pearse. "In the contemplation of the removal of the restriction bill till at any definite period, it would become necessary for the Bank to regulate the amount of its issues with a reference to the course of exchange with foreign countries; but while that exchange continues unfavorable, (an event as arising out of the balance of payments, not within the control or influence of the Bank,) I cannot see that any regulation within the means of the Bank would, in the event of an opening, effectually preclude the risk of a demand for specie being then made for the purpose of profit in exporting it to the continent."

"Do you not believe it impossible that the course of exchange should continue at its present unfavorable rate for any length of time, if the restriction of the cash payments of the Bank were removed?"

Mr. Whitmore. "I should think it very likely to continue as it is now, if the trade of the country and the prices abroad were also to continue as they now are."

Mr. Pearse. "It would, or it would not, continue, according as the trade of the country and its political expenses would operate."

"Then you do not believe that the facility which would be acquired of obtaining guineas by the removal of the restriction on the Bank, would operate upon the rate of exchange with foreign countries?"

Mr. Whitmore. "In whatever extent the guineas and the bullion might be exported, it would operate to the improvement of the exchange, like the exportation of any other commodity."

Mr. Pearse. "I concur in that opinion with the Governor."

"Is it not the practice with the Bank to keep the issue of their notes rather below the amount which the occasions of the public would appear to require, than to allow any excess of their amount with a view to profit?—I think I have already stated that the Bank does not comply with the whole demand upon them for discounts, and that they are never induced, by a view to their own profit, to push their issues beyond what they deem consistent with the public interest."

The opinions of the majority of commercial men, at this time, were well expressed by Mr. Chambers, a general merchant. "Have you ever had opportunities or occasions to consider the effect of an excessive, or forced paper currency, in any country upon its foreign exchanges with other countries?—In a small degree I have."

"What do you conceive the effect of such excess to be upon the foreign exchanges?—I apprehend the effect on the exchange would follow the depreciation of a forced currency."

"What do you say as to an excessive currency though not forced?—I do not conceive the thing possible."

"What do you mean by a forced paper currency?—A paper which I am obliged to take

against my will for more than its value. It is not forced so long as people take it willingly, which they will naturally do while undepreciated."

"May not the quantity of metallic currency be increased in proportion to payments which it has to effect, by an increased issue from the mines; and will not that have the effect of raising the money prices of all commodities?—I conceive an increase, or abundance of silver, or gold, would have the same effect upon those precious metals as a glut of any other commodity upon the market."

"And in the same manner may not that paper currency which continues to preserve its credit unimpeached, and which commercial people are perfectly willing to receive, be so augmented in quantity as to raise the local prices of commodities?—I do not conceive that that piece of paper for which I am obliged to give a valuable article of merchandize, can be increased beyond the want of it; nobody will give a valuable article for a piece of paper, that does not want it."

"Have you ever happened to pay any attention to the history of the paper currency of Scotland, between thirty and forty years ago, or to that of Ireland about the year 1804?—Some years ago I remember reading something about them, but the recollection is rather faint upon my mind."

"Do you call that paper, in your sense of the word forced, a forced paper currency, which either by law as it stands, or by force of public opinion, is not convertible into specie at the option of the holder?—*If it be convertible into other objects of my gratification without depreciation, I do not consider it forced.*"

"At the Mint price of standard gold in this country, how much gold does a Bank of England note for one pound represent?—5 dwts. 3 grns."

"At the present market price of standard gold of £4 12s. per ounce, how much gold do you get for a bank note of £1?—4 dwts. 8 grns."

"Do you consider that a bank of England note for £1, under these present circumstances, as exchangeable in gold for what it represents of that metal?—*I do not conceive gold to be a fairer standard for Bank of England notes than indigo, or broad cloth.*"

[Question repeated.]

"If it represents twenty shillings of that metal at the coinage price, it is not."

"If I go to a silversmith's shop and see a gold cup which he tells me is in weight exactly 100 guineas, and that he must have £10 more for the workmanship, will he give me that cup for £115 in Bank notes, gold bullion selling at £4 12s. per ounce?—He would sell his gold cup as he would any other bullion, at the bullion price, I suppose."

"Am I to understand by that, that he would sell his cup for £120, or thereabouts, being the value of the gold besides the £10 for the workmanship?—Yes."

"Will you state to the Committee, in your opinion, to what causes is referable the present unfavorable state of exchange between England and the Continent?—To the balance of payments being against this country."

"Can you give cases to illustrate the fact that you have assigned of the balance of payments being against this country?—Large British armies on the continent, slow returns for exports, quick

payments for imports, and very large stocks of imported goods now on hand in this country.

"Is there any other cause to which you attribute the present state of exchange?—I know of none other, that can affect it, excepting that of a forced depreciated currency.

"Is it your opinion that the currency of England is depreciated?—Certainly not."

15. Mr. Jeremiah Harman, a director of the Bank of England, who was examined on several subsequent occasions, and was always a stout opponent of the doctrine that the issues of bank notes had any influence on the exchanges, was asked, "Please to state what you conceive to be the principle by which the Bank of England regulates the extent of its issues, do you conceive it to be their practice, for example, to discount bills to the extent to which they are required, supposing the bills to be good, and to appear to be for real transactions, and the party applying to make application for no more than a reasonable amount; or do you take at all into consideration the state of the exchanges, and in any degree diminish the total amount of discounts afforded, and consequently, also the paper issues, when the exchanges are particularly unfavorable?—One of the first objects we have in view is the solidity of the paper brought in, and although we have no precise limit, we constantly keep in view the aggregate amount, as well as the amount of every individual account. With regard to the other part of the question, though the state of the exchanges is constantly watched, the amount of our discounts is not regulated with any reference to that circumstance."

* * * * *

"Do you not think that the sum total applied for, even though the accommodation afforded should be on the security of good bills to safe persons, might be such as to produce some excess in the quantity of the Bank issues if fully complied with?—I think if we discount only for solid persons, and such paper as is for real *bonâ fide* transactions, we cannot materially err."

* * * * *

"Supposing the exchange to continue long and greatly unfavorable, should you not be disposed to refer this circumstance in some measure to an excess of paper currency, or should you assume that the balance of trade had continued during that long period unfavorable?—I must very materially alter my opinions, before I can suppose that the exchanges will be influenced by any modifications of our paper currency."

16. There was but a single witness before this Committee who had clear and accurate views on the question, an anonymous continental merchant. He was asked, "Have you ever known the exchange to fall to the extent of 12 to 15 per cent. in any part of Europe, in which it was computed in coin containing a fixed quantity of gold or silver, or in paper, or bank money, exchanged at a fixed agio, either for such gold or silver coin, or for gold or silver bullion of a definite amount?—No, never except in countries where the export of their currency has been effectually prohibited, such as Sweden.

"Is it to Sweden only that you refer in making that exception?—I do not just now recollect any other country, where paper resting upon the

foundation of coin, the latter is effectually prevented from being exported.

"How is that prohibition made effectual in Sweden?—By the bank not issuing specie to any amount when the exchange is depreciated.

"What is the extent to which you conceive that the exchange is capable of falling in any country in Europe, at the present time, supposing it to be computed in coin of a definite value, or in something convertible into a definite quantity of gold or silver bullion?—The charge of transporting it, together with an adequate profit in proportion to the risk the transmitting such specie is liable to, would be the extent of the fluctuation.

"Can you state how much per cent. may be the present expense and risk of transporting gold from London to Amsterdam, or Hamburg, or any other principal places of trade on the continent?—Independent of the premium of insurance, it would be from 1½ to 2 per cent. from London to Hamburg.

"What do you conceive to be the amount of the risk?—The risk is so very variable from day to day, that it is impossible for me to state any fixed premium.

"What do you conceive to have been the average risk for the last fifteen months?—About 4 per cent.

"Do you not then conceive that such a fall of our exchange as has exceeded the sum necessary to compensate for the expense of transporting gold and silver in the last fifteen months, must be referred to the circumstance of the existence of a paper currency not convertible into specie?—Yes, certainly.

"Do you conceive, then, that out of the 15 or 20 per cent. which the English exchange has fallen in the last fifteen months, the larger proportion of from 10 to 12 or 13 per cent. may be referable to the circumstance of our paper currency not being convertible to cash?—I am clearly of that opinion.

"Do you then consider our paper as depreciated 10 to 13 per cent. in consequence of its non-convertibility into cash?—As I value everything by bullion, I conceive the paper currency of this country to be depreciated to the full extent of the 15 to 20 per cent.; or rather the difference in this country between the price of bullion, and the rate by which the coin is issued from the Mint.

"Do you conceive the balance of trade with the continent of Europe to be now for or against this country?—I conceive it to be considerably in favor of this country."

* * * * *

"Do you conceive that the quantity of bank paper in England influences its price, and has an effect upon the exchange?—In my opinion, the same principles attach themselves to bank paper, as to any other commodity, when carried to a certain extent.

"Do you not conceive that the limitation of bank paper has a general tendency to improve the exchange, and to augment its price?—Its price would certainly, in my opinion, be enhanced by its limitation, or what is the same thing, the nominal value of every article would be reduced; when this reduction had brought the price of bullion to the Mint value, the exchange would be at near par. A further diminution of this, or any

other circulating medium, would not tend to raise the exchange." * * *

"Is not the depreciation of paper currency as to its effect on foreign exchanges, the same as would be a debasement of the coin?—Yes, certainly, with the distinction that the extent of the one can be distinctly ascertained, but not that of the other."

Such are the opinions of the witnesses upon the great points of discussion before the Committee. We shall now give an abstract of this celebrated Report, reserving two parts of it for fuller discussion.

It was the composition of Mr. Horner, Mr. Huskisson, and Mr. Thornton.

Analysis of the Bullion Report.

17. The mint price of gold is £3 17s. 10½d. per ounce of standard fineness; but during 1806, 1807, 1808, the market price was £4. Towards the end of 1808, it rose rapidly, and stood very high during the whole of 1809, fluctuating from £4 9s. to £4 12s. per ounce. The price at £4 10s. is about 15½ per cent. above the mint price. The price had continued very much the same during that year—1810.

The price of foreign gold coin is generally higher than that of bar gold, as being more useful in foreign markets; the difference lately has been about 2s. per ounce. There is also a difference of about 4s. per ounce between bar gold, which may be sworn off for exportation as being foreign gold, and such as the dealer will not venture to swear off, the former being about £4 10s. in the market, and the latter £4 6s. Owing to these various distinctions, the price of exportable bar gold should be chiefly regarded in the present inquiry.

But the price of silver should be regarded as well. The mint price of standard silver is 5s. 2d. per ounce; at which price Spanish dollars are really worth 4s. 11½d. per ounce. During 1809, these dollars fluctuated from 5s. 5d. to 5s. 7d. per ounce, or from 10 to 13 per cent. above the mint price. During May, 1810, they were quoted at 5s. 8d., being more than 15 per cent. above the Mint price.

The exchanges with the Continent—Hamburgh, Amsterdam, and Paris—being the places with which they were established, had likewise become extremely unfavorable. During the latter half of 1809, and first quarter of 1810, those with Amsterdam and Hamburgh had been depressed from 16 to 20 per cent. below par; and that with Paris still lower. Since April, they had, to a certain extent, improved; that with Hamburgh had risen from 29.4 to 31; that with Amsterdam, from 31.8 to 33.5; and that with Paris from 19.16 to 21.11. These figures shewed that the exchange with Hamburgh was then £9 per cent. below par; that with Amsterdam, £7 per cent.; and that with Paris more than £14 per cent. below par.

All former reasonings and experience shewed that so remarkable a rise in the market price of gold, coupled with so great a fall in the foreign exchanges, was to be attributed to the state of our domestic currency. But, nevertheless, they had wished to hear from persons of commercial experience, what they had to say upon such an unusual state of things.

18. I. With respect to the High price of Gold.

Most of the witnesses ascribed the high price of gold entirely to an alleged scarcity of the article, arising from an unusual demand for it, chiefly for the use of the French armies, increased also by that state of alarm which leads to hoarding.

The Committee was of opinion that in a sound state of the British currency, the foundation of which is gold, no increased demand for gold wherever, or from whatever causes arising, could possibly produce here, for any length of time, a material rise in the price of gold. They doubted too, for other reasons, whether such an alleged demand for gold had really operated in the manner supposed.

If an unusual continental demand for gold influenced its market price in this country, it must also necessarily and indeed previously influence its price in continental markets. But there was no evidence of such a fact. While the price of gold was rising here, there was no corresponding rise in the price of gold bullion abroad, as valued in the respective currencies. This was decisively proved by witnesses of great experience, who declared that no alteration in the Mint price of gold in foreign places had occurred, nor had the market prices experienced an advance at all relative to the rise that had taken place in England.

At Hamburgh and Amsterdam, where silver is the measure of value, and not gold, as in this country, an unusual demand for gold would affect its money price, i.e., its price in silver. But no considerable rise in the silver price of gold had occurred at these places in the last year, which proved that there had been no considerable increase in the demand for gold. A certain rise in the market, or silver price of gold, at these places, above its mint silver price, was due to an alteration in the relative values of the two precious metals all over the world. The very same phenomenon had been observed in this country, for some time before the increase of our paper currency, appearing as a fall in the value of silver. Silver having fallen in its relative value to gold all over the world, gold has appeared to rise in price in those markets where silver is the fixed measure, and silver has appeared to fall in those where gold is the fixed measure.

19. If the rise of the market price of gold was at that time to the continental demand to supply the French armies, the very same thing must have happened in former wars, and convulsions of the continent, though perhaps not in so great a degree. During the Seven Years' war, and the American war, Sir Francis Baring very justly observes that no scarcity of bullion was felt in this country. Since the reformation of the coinage in 1773, up to the middle of 1799, two years and a half after the suspension of cash payments, the price of standard bar gold had been steady at £2 17s. 6d., with one very short exception. Except in a very few instances the price of standard bar gold had never been materially above the mint price, for twenty-four years, from the reform of the coinage to the suspension of cash payments. The two most remarkable periods when the market price of gold exceeded the Mint price, was in the reign of William III, when the silver coin was much degraded, and in the early part of the present reign (George III), when the

gold coinage was also much degraded. In both instances the excess of the market price of gold above the mint price, was found to be due to the bad state of the currency, and in both cases the reformation of the currency effectually lowered the market price to the Mint price. During the whole of 1796 and 1797, in which there was such a great demand for gold by the country bankers, to strengthen their position, the market price never rose above the Mint price.

20. The fact of there being a scarcity of gold in this country was very doubtful. Guineas had certainly disappeared from circulation; but that did not prove a scarcity of bullion, any more than the high price did. A large dealer, who spoke much of the scarcity, acknowledged he found no difficulty in getting any quantity of it, if he chose to pay the price for it. Large quantities had certainly been exported to the Continent during the last year; but there had been also very large importations. The changes which had affected Spain and Portugal, together with our own commercial advantages, rendered this country the channel through which the produce of the mines passed to the rest of the world and thus we had the opportunity of supplying ourselves first; and this was the last market which could be affected by a scarcity.

The rise in the market price of silver, which had nearly corresponded with that of gold, could not possibly be ascribed to a scarcity of silver, as the importation of silver had been, of late years, unusually large, while the usual drain for India and China had been stopped.

Thus, there was no evidence of facts upon which certain persons assumed that the rise in the market price of gold was due to an unusual demand, and its consequent scarcity. But even if they did exist, to ascribe the high price of gold to its scarcity involved a very serious misconception.

21. In this country gold is itself the measure of all exchangeable value, and all commodities are said to be dear or cheap, according as more or less gold is given for them. *But a given quantity of gold itself will never be exchanged for a greater or less quantity of gold of the same standard fineness.* At certain times, no doubt, it may be convenient to give more than an equal quantity of gold, to obtain gold in the form of a particular coin; but this difference can never exceed a certain small limit. The price of gold, being itself measured and expressed in gold, cannot be raised or lowered by an increased or diminished demand for it. An ounce of gold will exchange for neither less nor more than an ounce of gold of the same fineness, except so far as the one ounce may be coined, or otherwise manufactured, and the other is not; and the cost of that coinage or manufacture is the limit of the difference. *An ounce of standard gold bullion will not fetch more in our market than £3 17s. 10½d., unless £3 17s. 10½d., in our currency, contains less than an ounce of gold.* A change in the demand for gold will, no doubt, affect all other articles. The same quantity of gold may, at different times, purchase more or less of other commodities: and the price of gold may, in respect to them, be said to rise or fall; but the money—or gold—price of gold itself, must remain unaltered. This, however, is not the present state of things; the prices

of all commodities have risen, and that of gold along with them, and the cause of this can only be found in the state of the currency of the country.

22. The principles which govern the relative prices of gold in bullion and gold in coin, as well as of a paper currency, convertible into it, are very simple: gold bullion is the standard to which the Legislature intends that the gold coin should conform, and be as nearly identified as possible. If this intention were perfectly fulfilled, gold coin would always exactly exchange for the same quantity of other commodities as gold bullion; but it is subject to some small fluctuations, from the expense of converting bullion into coin. This, however, did not exceed £1 per cent., and it was expected that recent improvements would reduce it still lower. This £1 per cent. formed the limit to the possible rise of the value of coin above bullion.

Before the suspension of cash payments in 1797, two circumstances pointed out the causes and the limits of the depression of the coin below the price of bullion. First, the coinage had gradually become worn by use, and if melted down, would produce about £1 per cent. less than its regulated amount of bullion. In the early part of that reign, it had been greatly more serious; but it was now guarded against by the regulation of the statute that if guineas, whose weight when issued from the mint was 5 dwts. 9.440 grns. fell below 5 dwts. 8 grns., they should not be legal tender. The depreciation thus allowed was about 1.11 per cent. Secondly, the law which forbids any but light gold to be melted, and which, with very questionable policy, forbids the gold coin to be exported, or any bar gold, except such as is sworn not to be produced from it. The difference between bar gold which may or may not be sworn off for exportation amounts to about 3s. or 4s. per ounce.

The limit therefore by these two circumstances, which are the only ones that could influence the rate of the difference between the market and the mint price of gold, was about 5½ per cent., and the chief part of this difference was due to the ancient but erroneous policy of this country, which attempted to confine the coin within the kingdom; and thereby to make its value in the market less than it would be without such prohibition. And experience verified these arguments, for the difference between the market and the mint price of gold, while the Bank paid in specie, had never exceeded the limit of 5½ per cent.

23. The experience of Hamburgh fully corroborates these arguments. No difference with regard to silver, analogous to that between the mint and the market price of gold in this country, could ever occur there, because the three causes, which produced that difference here, were provided against there. All large payments at Hamburgh were made in bank money, which was a credit created in the books of the bank, by merchants who deposited silver of a given fineness. Payments were made by transferring a credit from the account of one merchant to another, and thus the wear and tear of the coin was prevented. Unlimited freedom was also given to withdraw, melt, or export it, and thus all the causes which produced a depression of the

value of the coin below bullion were effectually prevented. Thus silver is the only measure of exchangeable value, no difference between coin and bullion can arise, nor any variation in the value of coin, except from those general variations which affect the value of silver in the market of the world.

24. Before the suspension in 1797, the same arguments were generally applicable to gold coin in this country, which had not varied more than 5½ per cent. from bullion. But since that time it had been exposed to a new cause of variation, namely, from the possible excess of an inconvertible paper currency, and the limit of this variation is as indefinite as the possible excess of that paper. In fact gold had ceased to be our measure of value. The currency issued by the Bank of England and country banks, was now our only standard of prices. Its value might vary as indefinitely as its possible excess. But whether this fluctuating paper currency, or gold, was to continue to be the measure of value, the interests of the public demanded that the circulating medium should again be brought, as speedily as possible, to an equality of value with its real and legal standard—gold bullion.

25. The mint price of gold bullion is simply an equivalent weight expressed in coin. If therefore the weight of that coin be lessened, or if its standard be debased, it is then manifestly equal to a less amount of bullion than before. It will require more coin to be equivalent to the same amount of bullion, and, consequently, the market price of bullion will rise above the mint price. If the local currency of this country, being inconvertible into gold, be issued in excess, the market, or paper price of gold, will rise above the mint price. This excess, which can neither be exported to other countries, nor converted into specie, remains in the channel of circulation, and is gradually absorbed by the increasing of the prices of all commodities, exactly in the same manner as a general increase of the supply of the precious metals raises prices all over the world. An increased quantity of this local paper currency raises the prices of all other commodities, bullion included, as expressed in it, and thus the market price of gold, (or the price of gold as expressed in this local currency,) is raised above the mint price, (or the price as expressed in gold itself.) And if the currency of a neighbouring country is not increased in a similar proportion, it is quite clear that the currency of that country in which it has been increased, will fall in relative value as compared to the currency of a country in which it has not been increased, just in the same manner as it does in relation to commodities, and as the quantity of the currency of one country which is of equal value with a quantity of the currency of another country, is called the exchange between those countries, it is quite clear that the exchange will be to the disadvantage of that country in which an undue increase of currency takes place.

Hence the effect of an excessive currency, which is not exportable to other countries, and not convertible into specie, is to cause a general rise in the prices of all commodities, IN THE MARKET PRICE OF GOLD, AND A FALL IN THE FOREIGN EXCHANGE.

II.—As to the State of the Foreign Exchanges.

26. With respect to the state of the foreign exchanges, the Committee had also collected the opinions of persons of great practical experience. Some were of opinion that the depressed state of the exchanges was entirely due to the commercial situation of the country, to the imports, and the payments of subsidies having exceeded the exports. A very eminent continental merchant, however, states that the exchange could never fall lower than the extent of transporting bullion from one country to another, together with an adequate profit in proportion to the risk attending such a transmission; and whatever excess the depression of the exchange has reached within the last fifteen months, beyond that amount must be attributed to the inconvertible paper currency. This witness's evidence was entirely based upon the principle that bullion is the true regulator, both of the value of a local currency, and of the foreign exchanges, and that the free convertibility of paper currency into the precious metals, and the free exportation of those metals, place a limit to the fall of exchange.

27. There is no point of trade, considered politically, which is better settled than the subject of the foreign exchanges. The par of exchange between any two countries are the figures which denote the quantity of their respective currencies, into which an equal quantity of gold or silver bullion can be coined. If twenty-five French livres contained exactly the same quantity of pure silver as 20s., then 25 would be the par of exchange between London and Paris. If one country uses gold for its measure of value, and the other silver, of course the par will fluctuate according to the relative value of the two metals. The rate of exchange produced at any particular time by a balance of trade, or payments between any two countries, is a variation on one side or the other from the real par. But if any change takes place in the currency of one of the two countries, either by the wear or the debasement of a metallic currency, below its standard, or in the discredit of a forced paper currency, or in the excess of an inconvertible paper currency, the real par will be altered: a given portion of one currency having fallen in value, will, of course, no longer be equal to the same portion of the other currency. But though the real par is thus changed, dealers still continue to reckon their course of exchange from the former par; and in this state, a distinction must be made between the *real* and the *computed*, or *nominal*, exchange. The computed or nominal exchange will, of course, include both the difference arising from the state of trade, but also that between the original and the new par. These two differences may, of course, be added to each other, or they may be set off against each other. Thus, whether the balance of trade be for or against a country, whose currency is depreciated, the exchange will appear more unfavorable than it ought to be. In William III.'s time, the exchange between England and Holland was 25 per cent. against England, but the English coinage was degraded more than 25 per cent. below the standard, which proved that the real exchange was in favor of England. If the currencies of both countries are depreciated, the par of exchange will, of course, vary according to their relative value.

28. It has long been settled and understood as a principle, and indeed the truth of the position is so plain, and so uniformly agreed to by all the practical authorities, commercial and political, that the difference of exchange resulting from the state of trade and payments between two countries is limited by the expense of conveying and insuring bullion from one to the other, that the Committee assume it as indisputable. The peculiar circumstances of the country might render the premium a war risk, then even greater than usual, and consequently it was possible that the increased risk might lower the limit of the fall of the exchange, so as to account for its present state.

29. It was undoubtedly proved that, at that period, the risk and the premium on transporting bullion from London to Hamburg did considerably exceed that at any former period. In former times even of war, the cost, including insurance, did not exceed $3\frac{1}{2}$ per cent. It was, however, shewn that at that time this cost had risen to 7 per cent; but it did not exceed that. The risk and cost of sending it to an inland place like Paris, was, of course, somewhat more. It appeared, therefore, conclusively, that the limit by which the depression of the exchanges arising out of the commercial relations of the country, was bounded by 7 per cent. with Hamburg and Holland, and somewhat more with Paris. But the rest of the fall above that limit must be due to some other cause.

30. From the evidence before them, the Committee were of opinion that the real exchange did fall during the last year to nearly its extreme limit, as indicated by the cost of transmitting bullion.

But although the computed, or nominal, exchange may appear to be advanced to the country, a simple calculation will shew what is the state of the real exchange. (EXCHANGES).

A witness, who was strongly wedded to the opinion that the commercial relations of the country might account for any depression of the exchange, however great, was asked to make this calculation. From these calculations it resulted that while the computed, or nominal, exchange with Hamburg was 16 or 17 per cent. below par, the real exchange arising out of the commercial relations, and the balance of payments, was no more than $5\frac{1}{2}$ per cent. against this country; while the nominal exchange with Amsterdam, was about 15 per cent. below par, the real exchange was not more than 7 per cent. below par; and while the nominal exchange with Paris was 20 per cent. below par, the real exchange was no more than $8\frac{1}{2}$ per cent. against this country. Consequently there was a fall of 11 per cent. with Hamburg, of 8 per cent. with Amsterdam, and of $11\frac{1}{2}$ per cent. with Paris, to be explained in some other way. And if the latest statements of the exchange were taken, it might possibly be found that though the nominal exchange was against, the real exchange was in favor of this country.

The foregoing reasonings relating to the exchanges alone made it difficult to resist the conclusion that a portion of the fall of the exchanges was due not to the state of trade, but to a change in the relative value of our currency. But when the fall in the exchange was coupled with the rise in the market price of gold, the inference appeared to be demonstrated.

III. *As to the opinions of the Directors of the Bank of England, and their mode of regulating their issues.*

31. In consequence of the opinion entertained by the Committee that in the artificial state of the currency, it was most important to watch the foreign exchanges, and the market price of gold, they were desirous to learn whether the directors of the Bank held the same opinion, and controlled their issues by them, and also whether the directors, from the great fall in the exchanges, and the rise in the market price of gold during the preceding year, had at all suspected that the currency was excessive.

The directors, however, entirely repudiated such ideas. They, as well as several merchants, who were examined, alleged that the issues of the Bank had no influence on the state of the exchange, or the price of bullion, placing much reliance on the argument that they had been unable to trace any connection between them. Nevertheless the Committee in no way distrusted the principles of general reasoning they had used, because there were so many causes of a temporary and fluctuating nature, that might affect the case that the immediate connection might not be apparent. What they regarded was the *permanent* state of the exchanges.

32. The Committee considered it an error of great practical importance to suppose that the exchanges with foreign countries, and the price of bullion, could not be affected by the amount of an inconvertible paper currency. That excessive issues of paper will lower the foreign exchanges, and raise the price of bullion, was not only proved by the most eminent commercial writers, but its truth has been practically illustrated by the history of almost every state in modern times, which has used a paper currency, and the statesmen in all those countries have finally adopted this principle as the criterion whereby to judge whether the paper currency was excessive.

The history of the paper currencies in the British colonies in North America, during the last century, the assignats of the French Republic, and the paper currency of the Austrian government during the last campaign, and the state of the Portuguese currency, fully bore out the truth of these principles.

33. The United Kingdom itself furnished similar examples. The Report then quotes the derangement of the Scotch currency and the means taken to cure it, narrated in *BANKING IN SCOTLAND*, § 293, also the derangement of the Irish currency and exchange in 1804, narrated in *BANKING IN IRELAND*, § 342—373. It also adduces an instance from the experience of the Bank of England, in 1696. But as this part of the Report is full of the most serious chronological errors, and it is, moreover, one of the very first importance in illustrating the theory of the exchanges and the currency, we have reserved it to the end of the analysis for full and special discussion.

34. The Directors of the Bank of England were not to be altogether blamed if they did not at once perceive the principles upon which so delicate a trust as that which had been committed to them, namely, the regulation of the currency, which had been rather imposed upon them than

sought for by them. But it was material to remark that, while they were subject to pay their notes in specie, the state of the foreign exchanges, and the price of gold did most materially influence its conduct with respect to its issues. While they were liable to pay gold on demand, a fall in the exchange, and a rise in the price of gold, was soon felt by them by a demand upon them for gold. Thus the evil cured itself. The Directors finding their specie reduced, had to replace it at a heavy loss, instinctively curtailed their issues, and thus raised the value of the whole currency, gold as well as paper.

35. The Bank Directors, perhaps, did not fully perceive the operation of these causes, but they unquestionably limited their paper during a drain of gold. This had been several times admitted by them. But the suspension of cash payments exempted them from the drain of gold during an unfavorable exchange, and a high price of bullion; and the directors, feeling no inconvenience, had failed to restore the exchanges, and reduce the price of gold by contracting their issues. The directors of old, perhaps, did not perceive or acknowledge these principles more distinctly than the present ones, but they felt the inconvenience and obeyed its impulse. Under present circumstances no inconvenience is felt, and no contraction takes place. But the committee are most clearly of opinion that so long as the suspension of cash payments is permitted to subsist, the price of gold bullion and the general course of exchange with foreign countries, taken for a considerable period, form the best general criterion from which any inference can be drawn as to the sufficiency or excess of paper currency in circulation. Further, that although the commercial state of the country, and the political state of the continent may have had some effect, yet a view of the facts and reasonings already stated, the present high price of gold, and the depreciation of the foreign exchanges, was to be ascribed to the want of a permanent check, and a sufficient limitation of the paper currency of the country.

36. The Report then proceeds to investigate the theory of currency propounded by Adam Smith, and maintained by the directors, and which had been previously maintained by the committee of 1804, that the issues of the bank could not be excessive so long as they were confined to the discount of good mercantile paper, founded on real transactions. This theory is one of the most plausible and subtle theories ever started, and demands a full investigation. We have reserved it also to the end of the analysis.

37. The committee then pointed out the evils of the usury laws, which are now happily repealed, and therefore we may pass over this part.

The suspension of cash payments had had the effect of entrusting to the Bank of England the duty of supplying the quantity of circulating medium which the public required, a trust which it was unreasonable to expect they could ever discharge. The most detailed knowledge of the actual state of trade, combined with the most profound science in all the principles of money and circulation, could not enable any set of men to do it. When the currency was purely metallic, or composed of paper convertible into specie at the will of the holder, the natural process of

commerce, by establishing exchanges among all the nations of the world, adjusts in every particular country the proportion of circulating medium to its actual occasions. This proportion, so adjusted and maintained by the operation of nature, cannot be adjusted by any human wisdom or skill. No rules can be devised for the discretionary issues of paper currency, though some cautions might be pointed out to check and control its issues. The directors of the Bank had exercised the powers confided to them since 1797, with extraordinary forbearance and moderation, all things considered, but nevertheless the committee was fully convinced that their recent policy involved great practical errors, the effects of a new system, which Parliament should have taken earlier measures to guard against. And when the directors of the bank maintained that their paper could not be in excess if advanced to merchants on good bills, payable at fixed periods, and that it had no effect on the foreign exchanges, or on the market price of bullion, the committee said without hesitation that these opinions must be considered, in a great measure, as the cause of the present state of things.

IV. *As to the issues of the Bank of England and country banks.*

38. The committee then proceeds to notice the great increase that had taken place in the issues of the Bank of England, and country banks. Before 1796, the issues of the Bank had scarcely ever exceeded £11,000,000. But since then they had greatly increased, and the amount in May, 1810, was about £21,249,980. The greatest proportionate increase was in the small notes. They were very rapidly increased from 1799 to 1802, and again from May, 1809 to May 1810. In 1798 they were £1,807,502; in 1802, £3,136,477; in May, 1809, £4,509,470; in May, 1810, £6,161,020. The discounts of the Bank had also enormously increased, but as the Directors did not wish the figures made public, they did not give them, not that discounts by the Bank was anything but a great public advantage, taken by themselves, but it was only an *excess* of currency they were anxious to guard against.

39. But it was a very important principle to state, that the mere numerical amount of bank notes in circulation was no criterion whether these notes were excessive or not. The same amount of paper may be too little at one time, and too much at another. The quantity of currency will vary in some degree with the extent of the trade, and the increase of trade since the suspension may have caused some increase of the currency. *But the quantity of currency bears no fixed proportion to the quantity of commodities, and any inferences proceeding upon such a supposition would be entirely erroneous.* In a state of high public credit, a much smaller amount is necessary than when alarms make individuals call in their advances and hoard. Moreover, a different amount will be required according to the various methods of economizing it, which money dealers devise. The different improvements, which had been recently devised, must have had a greater effect than was commonly supposed in rendering the same sum sufficient for a much greater amount of trade and payments than formerly. These improvements are detailed.

They unquestionably shew that a smaller increase of Bank paper was necessary, to supply the wants of an increased trade, than would otherwise have been necessary, and shew how impossible it is from the numerical amount alone of that paper to pronounce whether it is excessive or not; a more sure criterion must be resorted to; AND SUCH A CRITERION IS ONLY TO BE FOUND IN THE STATE OF THE EXCHANGES, AND THE PRICE OF GOLD BULLION.

40. The crises of 1793 and 1797 throw much light on this last principle. In 1793, the distress was caused by a failure of confidence in the country currency, and a consequent pressure upon that of London. The Bank of England refused to enlarge its issues, and the notes that were in circulation were hoarded through panic. In this crisis a loan of Exchequer bills was made to all merchants who had good security to offer. The confidence this measure produced as well as the increased means of obtaining Bank notes by the sale of the bills, speedily relieved the distress both in London and the country. The effect of this was similar to an increased issue of notes. Without approving of the particular method in which this operation was done, it is an important illustration of the principle, THAT AN ENLARGED ACCOMMODATION IS THE TRUE REMEDY FOR THAT OCCASIONAL FAILURE OF CONFIDENCE IN THE COUNTRY DISTRICTS TO WHICH OUR SYSTEM OF PAPER CREDIT IS UNAVOIDABLY EXPOSED.

41. The circumstances of 1797 were very similar to those of 1793, and an effectual remedy for the panic might perhaps have been provided, if the Bank of England had had courage to extend, instead of restricting its accommodation, and issues of notes. Some few persons thought so at the time; and the Governor and Deputy-governor of the Bank stated to the Committee that they and many of the Directors *are now satisfied from the experience of the year 1797, that the diminution of their notes on that emergency increased the public distress; an opinion in the correctness of which the Committee entirely concur.*

42. The experience of 1793 and 1797, contrasted with the facts stated in the Report, suggests a distinction most important to be kept in view, between the demand upon the Bank for gold for internal circulation, arising from a temporary failure of confidence, sometimes very great and sudden, and a drain arising out of the unfavorable state of the exchanges. The former, while the Bank maintains its high credit, seems likely to be best relieved by a judicious increase of accommodation to the country; the latter, so long as the Bank does not pay in specie, ought to suggest to the Directors, a question whether their issues may not be already too abundant. But it is essentially necessary that any reduction that might be deemed necessary, should take place very cautiously and gradually.

43. The country bank paper was a superstructure reared on the basis of the Bank of England paper, into which it is convertible. But any enlargement of the basis necessarily caused an enlargement of the superstructure. The committee had not been able to ascertain exactly the positive amount of increase, but it had unquestionably been very large. As they had before observed, no certain conclusion could be drawn from the actual amount, without reference to

other circumstances; yet the fact of a great increase, coupled with all the indications of a depreciated currency did afford very strong evidence that the issues were not restrained within proper limits.

44. The country banks had been able to create and issue about £5,000,000, at an expense to themselves of not more than £100,000, which was thrown into the channel of circulation, the value of which in exchange for all other commodities is gradually lowered in proportion as the mass is augmented. If so unnatural a state of things was to continue, the state ought to participate more largely in the profits of the issue. But that was not a policy they were disposed to recommend. And just as they agreed with Adam Smith, and all the most able writers and statesmen of this country, in considering a paper currency, constantly convertible into specie, as one of the greatest practical improvements which can be made in the political and domestic economy of any state, and in regarding country banks issuing such paper, a most valuable institution, so they were anxious to revert to the former state and practice in these things any systematic departure from which would lead to many calamities, among other things the destruction of the system itself.

45. Upon the whole, then, the committee are of opinion that there is at present an excessive paper currency, of which the most unequivocal symptom is the present high price of bullion, and next to that, the low state of the foreign exchanges, which was owing to the want of a due control in the issues of the Bank of England. No permanent or adequate provision against an excess of paper currency can be found, except in the convertibility of such paper into specie. It was greatly to be regretted, therefore, that the suspension of cash payments, which was only intended to be temporary, should have been continued as a permanent war measure.

46. The evils which would result from such an excess of currency as causes its depreciation, are universal, and weigh upon all classes of society; and the honor of Parliament is concerned not to allow in this commercial country a system of currency, which has no fixed value, and which destroys the faith of all money contracts, and obligations between man and man. The longer it was continued, the greater was the temptation to resort to a depreciation of the gold coin by altering its standard. Many governments had done so, and it was an obvious remedy. But it would be a most manifest breach of public faith, to reduce the coin to the value of the paper, rather than to restore the paper to the legal standard of the coin.

47. Many palliatives, or remedies, for the present state of things had been proposed, but the Committee are of opinion they are all useless, inadequate, and mischievous, and that there is only one sufficient and efficacious remedy, namely—a restoration of payments in cash as speedily as possible. No doubt such a measure as this required to be done with considerable caution, but all difficulties might be provided against, by entrusting the charge of the operation to the Bank of England, and allowing it sufficient time to do so, so as not to embarrass public and commercial credit. Two years appear to the Committee a reasonable time, and they are of opinion that

Parliament should terminate at that period the Acts which authorize the restriction. By the present law, the period of the resumption of cash payments stood limited to six months after a general peace; but even if peace were declared within that period, the Committee, having regard to the difficulty and danger of reducing its issues from their present amount, would still recommend that the Bank should not be compelled to resume before two years.

48. Such is a summary of this celebrated Report. Its reception by Parliament is narrated in *BANKING IN ENGLAND*, § 159. We shall not in this place give any account of the debate on the doctrines maintained in opposition to it, either in Parliament, or the flood of pamphlets it called forth, as we have done that under the respective names,—*HORNER, HUSKISSON, BOSANQUET, VANSITTART, ROSE, THORNTON, &c., &c.* There are, however, two parts of the Bullion Report which we have already said required fuller notice; the one because it relates to a very important crisis in our currency, which will illustrate some of the fundamental principles of currency and exchange, and the other because it investigates a very important and subtle theory of paper currency.

On the account of the Currency Crisis of 1696-97, in the Bullion Report.

49. One of the examples adduced by the Bullion Report to shew the effects of excessive paper issues on the foreign exchanges, is the monetary crisis of 1696-97, as follows: "The experience of the Bank of England itself, within a very short period after its establishment, furnishes a very instructive illustration of all the foregoing principles and reasonings. In this instance, the effects of a depreciation of the coin by wear and clipping were coupled with the effect of an excessive issue of paper. The Directors did not at once attain a very accurate knowledge of all the principles by which such an institution must be conducted. They lent money not only by discount, but upon real securities, mortgages, and even pledges of commodities not perishable; at the same time, the Bank contributed most materially to the service of Government for the support of the army on the Continent. By the liberality of those loans to private individuals, as well as by the large advances to Government, the quantity of the notes of the Bank became excessive, their relative value was depreciated, and they fell to a discount of 17 per cent. At this time, there appears to have been no failure of the public confidence in the funds of the Bank; for its stock sold for 110 per cent., though only sixty per cent. upon the subscription had been paid in. By the conjoint effect of this depreciation of the paper of the Bank from excess, and of the depreciation of the silver coin from wear and clipping, the price of gold bullion was so much raised, that guineas were as high as 30s.; all that had remained of good silver gradually disappeared from circulation; and the exchange with Holland, which had been before a little affected by the remittances for the army, sunk as low as 25 per cent. below par, when the bank-notes were at a discount of 17 per cent. Several expedients were tried, both by Parliament and the Bank, to force a better silver coin into circulation, and to reduce the price of guineas, but without effect. At

length, the true remedies were resorted to; first, by a new coinage of silver, which restored that part of the currency to its standard value, though the scarcity of money occasioned by calling in the old coin brought the Bank into straits, and even, for a time, affected its credit; secondly, by taking out of the circulation the excess of bank-notes. This last operation appears to have been effected very judiciously. Parliament consented to enlarge the capital stock of the Bank, but annexed a condition, directing that a certain portion of the new subscriptions should be made good in bank-notes. In proportion to the notes sunk in this manner, the value of those which remained in circulation began presently to rise; in a short time, the notes were at par, and the foreign exchanges nearly so. These details are all very fully mentioned in authentic tracts published at the time, and the case appears to your Committee to afford much instruction upon the subject of their present inquiry." The only tracts quoted by the Report are *A short Account of the Bank*, by Mr. Godfrey, one of the original directors, and *A short History of the last Parliament*, 1699, by Dr. Drake.

50. There is no person possessed of the slightest knowledge of banking and monetary science who would not see at once that there is some gross blunder in the preceding passage; for it evidently asserts that *while the Bank was paying in specie, its notes fell to, and continued at, a discount of 17 per cent.* which every economist knows to be impossible in the nature of things. The only tracts quoted by the Committee are those mentioned above, though they refer to others. We have no hesitation in saying that this passage contains nothing but a mass of blunders, historical, chronological, and scientific, which we shall fully investigate, on account of the important bearing of the crisis on the theory of the currency and the exchanges.

This passage may be said to contain the following allegations:

1. That very soon after the foundation of the Bank, it made excessive issues.
2. That in consequence of these excessive issues, *and while they continued to pay their notes in specie on demand*, their notes fell to 17 per cent. discount.
3. That in consequence of these excessive issues of paper by the Bank, and the depreciation of the silver coin by wear and clipping, guineas rose to 30s. from 21s. 6d., and that the remaining good silver disappeared from circulation.
4. That in consequence of the two preceding causes, exchanges with Holland rose to 25 per cent. against England.
5. That many attempts were made by the Bank and Parliament to reduce the price of guineas, and force a better silver coinage into circulation, which all failed.
6. That measures were at length resorted to, of calling in the old silver coinage, and re-issuing it at full weight, and taking the excessive issues of the Bank out of circulation, which were finally successful, restored the exchanges and the bank-notes to par.

We must now examine each of these propositions separately.

With respect to the first, what is or what is

not an excessive issue, is a matter of so much speculation, that it is quite impossible to affirm or deny it.

With respect to the second allegation, there is not only *no* evidence in its favor in the pamphlets quoted, but the most overwhelming evidence against it. Mr. Godfrey's pamphlet was written in June, 1695, when the credit of the Bank was in the most flourishing condition, when he makes this credit a matter of great boast; and he says that the only reason why the credit of the bank-notes was so good, was that their holders knew that they could get their money *instantly on demand for them*. Mr. Godfrey was killed at Namur in July, 1695, and bank-notes were not at a discount till May, 1696. We have given a full abstract of this pamphlet, to which we may refer (GODFREY), by which it will be seen that it lends no support to the allegation of the Report.

With respect to the third allegation, we have given, in the article COINAGE, abundance of extracts of the most authoritative nature from contemporary pamphlets, and from the Journals of the House of Commons, proving that guineas were at 30s in the early part of 1695, when the credit of the Bank was unimpeached, when all its notes were paid on demand, and FOURTEEN months BEFORE the stoppage in May, 1696, which caused the notes to fall to a discount.

The same reasoning is true of the fourth allegation. The exchange with Holland was 25 per cent. against England in the early part of 1695, and as stated by contemporary pamphlets, (COINAGE), was due to the same cause as the high price of guineas, namely, the bad state of the silver coinage.

The fifth allegation is entirely erroneous. Parliament made no attempt to reduce guineas till February, 1696 (COINAGE), when the silver coinage had been already called in.

The sixth allegation involves great chronological errors, into which the Committee were led by Dr. Drake; for they make it appear that the foreign exchanges were restored to par first, and then the bank-notes; or, at all events, that these two results were effected simultaneously. And for this they have the authority of Dr. Drake's tract (DRAKE). But Dr. Drake was a clergyman, and probably not very well versed in commercial matters. Moreover, he wrote some years after the event, when these minute dates, of whose importance he was probably not sufficiently aware, became confounded. But we have shewn by extracts from a contemporary and mercantile writer, John Cary (CARY), that the exchanges were restored to par in October, 1696, and that bank-notes were not brought to par till towards the end of 1697, as may be seen by the extracts we have given from Narcissus Luttrell's diary (LUTTRELL). In fact, all contemporary evidence proves that as the fall in the foreign exchanges and the rise of the market price of bullion was owing entirely to the badness of the coin, so the restoration of both to par was owing entirely to the restoration of the coinage, and had nothing whatever to do with the bank-notes. In fact, the fall of the bank-notes was due entirely to the stoppage of the Bank of England in May, 1696, which the Bullion Report seems to be unaware of, and had nothing to do

with the fall in the exchange or the rise in the price of bullion. But, nevertheless, this crisis is a classical example of the truth of the principle of the Report, which, indeed, is a self-evident truism, as soon as the nature of the thing is truly apprehended; namely, that a depreciation of the medium in which payments are made causes a rise in the apparent price of bullion, and a nominal fall in the foreign exchanges, a principle which was perfectly well understood by the ablest merchants and statesmen of 1696.

Investigation of the Theory of basing a Paper Currency on the Discount of Mercantile Bills.

51. We shall now examine the way in which the Bullion Report endeavours to refute an extremely plausible and subtle theory of paper currency.

The chapter on *Metallic and Paper Currency* in the "*Wealth of Nations*," will unfortunately be found, on a close critical examination, to contain many inconsistent and erroneous doctrines, which we cannot examine at proper length here. But it contains two principles which have acquired some celebrity. One is expressed in the following dogma. "The whole paper money of every kind which can easily circulate in any country, never can exceed the value of the gold and silver of which it supplies the place, or which (*the commerce being supposed the same*) would circulate there, if there was no paper money." Now it will be observed that this dogma is laid down *with a condition*. Adam Smith only asserts it on the supposition that *the commerce remains the same*. But many modern writers of influence, wholly dropping the condition, or qualification out of view, assert it as an absolute dogma, *that when paper notes are allowed to be issued, they should be exactly equal in quantity to the metallic currency they displace*. This, however, is a doctrine much older than Adam Smith, because it is mentioned by John Law. This is the doctrine generally known at the present day by the name of the CURRENCY PRINCIPLE. It is quite clear, however, that the modern supporters of it commit what is called in logic, the fallacy *A dicto secundum quid, ad dictum simpliciter*, that is, they jump from an assertion made with a qualification to an absolute assertion. If the commerce remains the same, Adam Smith's assertion may have some shew of plausibility, but then there is no necessity that the commerce should remain the same. Adam Smith had already shewn himself that the creation of bank notes increases commerce. In a subsequent part of the same chapter he says, "When a bank discounts to a merchant a real bill of exchange drawn by a real creditor upon a real debtor, and which as soon as it becomes due, is really paid by that debtor, it only advances to him a part of the value which he would otherwise be obliged to keep by him unemployed, and in ready money for answering occasional demands." This passage is the origin of that theory of currency which the Bullion Report investigates and condemns, namely, "*That when the Bank only discounts good bills of exchange founded upon real transactions it cannot issue notes in excess*." This theory was strongly brought before the Irish Currency and Exchange Committee, in 1804, but it was not noticed by them. It was also strenuously asserted before

the Bullion Committee, in 1810, and we shall now present to our readers what the Report says of it.

52. Your committee cannot help again calling the attention of the House to the consequences which have resulted from the peculiar situation in which the Bank of England was placed by the suspension of cash payments. So long as the paper of the bank was convertible into specie at the will of the holder, it was enough, both for the safety of the bank and for the public interest, in what regarded its circulating medium, that the directors attended only to the character and quality of the bills discounted, as real ones, and payable at fixed and short periods. They could not much exceed the proper bounds in respect of the quantity and amount of the bills discounted, so as thereby to produce an excess of their paper in circulation, without quickly finding that the surplus returned upon themselves in demand for specie. The private interest of the bank to guard themselves against a continued demand of that nature, was a sufficient protection for the public against any such excess of bank paper as would occasion a material fall in the relative value of the circulating medium. The restriction of cash payments, as has already been shewn, having rendered the same preventive policy no longer necessary to the bank, has removed that check upon its issues, which was the public security against an excess. When the bank directors were no longer exposed to the inconvenience of a drain upon them for gold, they naturally felt that they had no such inconvenience to guard against, by a more restrained system of discounts and advances; and it was very natural for them to pursue as before (but without that sort of guard and limitation which was now become unnecessary to their own security), the same liberal and prudent system of commercial advances, from which the prosperity of their own establishment had resulted, as well as in a great degree the commercial prosperity of the whole country. It was natural for the bank directors to believe that nothing but benefit could accrue to the public at large, while they saw the growth of bank profits go hand in hand with the accommodation granted to the merchants. It was hardly to be expected of the directors of the bank that they should be fully aware of the consequences that might result from their pursuing, after the suspension of cash payments, the same system which they had found a safe one before. To watch the operation of so new a law, and to provide against the injury which might result from it to the public interests was the province not so much of the bank as of the legislature; and in the opinion of your committee there is room to regret that this House has not taken earlier notice of all the consequences of that law.

"By far the most important of these consequences is that while the convertibility into specie no longer exists as a check to an over issue of paper, the bank directors have not perceived that the removal of that check rendered it possible that such an excess might be issued by the discount of perfectly good bills. So far from perceiving this, your committee have shewn that they maintain the contrary doctrine with the utmost confidence, however it may be qualified occasionally by some of their expressions. That this doctrine is a very fallacious one, your committee

cannot entertain a doubt. *The fallacy upon which it is founded lies in not distinguishing between an advance of capital to merchants, and an additional supply of currency to the general mass of circulating medium.* If the advance of capital only is considered, as made to those who are ready to employ it in judicious and productive undertakings, it is evident that there need be no other limit to the total amount of advances than what the means of the lender, and his prudence in the selection of borrowers, may impose. But in the present situation of the bank, entrusted as it is with the function of supplying the public with that paper currency which forms the basis of our circulation, and at the same time not subjected to the liability of converting the paper into specie, every advance which it makes of capital to the merchants in the shape of discount, becomes an addition also to the *mass of circulating medium*. In the first instance, when the advance is made by notes paid in discount of a bill, it is *undoubtedly so much capital*, so much power of making purchases placed in the hands of the merchant, who receives the notes; and if those hands are safe, the operation is so far, and in this its first step, useful and productive to the public. But as soon as the portion of circulating medium, in which the advance was thus made, performs in the hands of him to whom it was advanced, *this its first operation as capital* as soon as the notes are exchanged by him for some other article which is capital, they fall into the channel of circulation as *so much circulating medium*, and form an addition to the mass of currency. The necessary effect of every such addition to the mass, is to diminish the relative value of any given portion of that mass in exchange for commodities. If the advance was made by notes convertible into specie, this diminution of the relative value of any given portion of the whole mass would speedily bring back upon the bank which issued the notes, as much as was excessive. But if by law they are not so convertible, of course this excess will not be brought back, but will remain in the channel of circulation until paid in again to the bank itself in discharge of the bills which were originally discounted. During the whole time they remain out they perform all the functions of circulating medium, and before they come to be paid in discharge of these bills, they have already been followed by a new issue of notes in a similar operation of discounting. Each successive advance repeats the same process. If the whole sum of discounts is progressively increasing, the amount of paper which remains out in circulation over and above what is otherwise wanted for the occasions of the public, will progressively increase also, and the money prices of commodities will progressively rise. This progress may be as indefinite as the range of speculation and adventure in a great commercial country."

53. Such is the reasoning of the Bullion Report, to shew the fallacy of an extremely subtle and plausible theory of paper currency. It was decisively condemned by Mr. Horsley Palmer, before the Bank Charter Committee of 1832. The conclusions of the Committee are perfectly just, but the expressions are in some respects ambiguous—in some inaccurate—and altogether the reasoning is inadequate to effect its purpose of demonstrating the fallacy of the doctrine. The

expression "good bills" is one which we shall shew is very ambiguous. The Report has further been clouded by the false distinction between "capital" and "circulating medium;" for circulating medium, or currency, is sometimes "capital," and sometimes not, according to the method in which it is employed. (CAPITAL). The Report, however, recognizes this doctrine that *the same thing is, or is not, capital according to the way in which it is used*. Again, the Report is in error in assuming that the necessary effect of every addition to the currency is to diminish the value of the whole mass; because the value of the currency is always proportionate to the work it has to do; and it is only a change in the proportion between the currency and the work that it has to do, that causes a change in its value. Nor could the very small amount of currency added to the mass, in so short a time as during the *échance* of the bills that were discounted, have any effect on general prices.

54. We shall find that by starting from our fundamental conception of currency as transferable debt, and that the value of the currency depends upon the quantity of transferable debt it represents, the fallacy of this theory can be demonstrated with great ease and simplicity, and the mischievous consequences which followed from it, explained. When the merchant A comes to the bank, to discount the acceptance of B, it is a sale of the debt to the bank. The bank buys a debt payable at a fixed time after date, with its notes, which are so many small debts payable to bearer on demand, while the notes are convertible. The transaction is simply an exchange of debts. At the appointed time, it is B's duty to take a quantity of currency to the bank, and discharge his debt. He does this either in coin or in the bank's own notes. If he pays his own debts by the bank's notes, it is simply a re-exchange of debts between him and the bank; he extinguishes his own debt to the bank, and at the same time an equal quantity of the bank's debt is taken out of circulation, and extinguished. Consequently the proportion existing previously between the currency and the quantity of debt it represents, remains unaltered. If the merchant discharges his debt partly in coin and partly in notes, or wholly in coin, the same result follows; the notes which remain out in circulation still represent the same amount of debt—the notes and coin being independent quantities, it makes no difference to the whole mass, which is removed out of circulation. But let us suppose that the acceptor fails to meet his engagement, and cannot pay his debt. Then the debt due to the bank is lost and extinguished; but the debt *against* the bank remains. And the bank, while its notes are payable to bearer on demand, must pay this debt out of its remaining capital. Still, however, though this is loss of capital to the bank, as the notes are taken out of circulation, the value of the notes remaining in circulation will not be affected. But now let us suppose the notes to be inconvertible, then, as before, if the acceptor pays the debt, the notes will be taken out of circulation, and extinguished simultaneously with the debt which they purchased, and the value of those remaining in circulation will not be altered. But suppose that the acceptor fails, and cannot pay his debt, then that

debt is extinguished; but the notes issued in the purchase of it remain in circulation, and are a mere addition to the circulating medium already existing, without any corresponding increase of the debt it represents. It would have exactly the same practical effect as if, for every good bill of £1,000, the Bank were to issue an excess of currency—say £1,500, for example; and when the bill was paid, only £1,000 would be taken out of circulation, and the remainder—£500—would remain in circulation. This residuum as we may call it, would go to swell up the existing quantity of circulating medium, and depreciate the value of any given portion of it, exactly in the same way as a constant increase in the gold currency would gradually cause a diminution in its value. Every such operation, therefore, alters the proportion between the currency and the debt it represents; and though, no doubt, a few unsuccessful operations of this sort would not have any sensible effect in changing its value, yet a repeated succession of them must necessarily do so ultimately, just as adding a drop of water in a bucket may not perceptibly increase the height of the water, yet a continued series of drops will at length cause the water to overflow the bucket; so a continued series of such operations under an inconvertible paper currency, must necessarily result in a serious diminution in the value of the whole.

55. But it may happen that, even though the merchant pays his debt, and no loss of capital ensues to the bank, yet it may be a loss of capital to him. Thus, when he bought the goods on credit, and gave his acceptance for them, which was purchased by the bank, he meant to employ those goods as *capital*—that is, he bought them for the purpose of selling them again, with a profit. If he succeeds in this object, and sells them to advantage, he pays his acceptance out of the proceeds realised by the goods, and his capital is increased more or less, according to the greater or less advantage he sells them at. But if he has made a miscalculation, and sells the goods at a loss, he must still make good his debt to the bank out of his remaining capital; and such a transaction is a loss of capital to him. But every loss of capital to an individual is a loss of capital to the whole community. (J. B. Say has also remarked this: "Un mauvais spéculateur est aussi fatal à la prospérité générale qu'un dissipationnaire."—*Traité d'Economie Politique*, p. 445, Edit. Guillaumin). And the great general result to the community is absolutely the same, whether the loss of capital accrues to the individual, or to the bank. The quantity of currency remains the same; but what it represented is diminished. Consequently, every unsuccessful operation in trade alters the proportion between the currency and the quantity of what it represents; and therefore every unsuccessful operation *necessarily* tends to diminish the value of any given amount of the whole currency; unless some means can be devised by which a certain quantity of it can be removed from circulation, and so raise its value. Now the diminution in the value of the currency inevitably shews itself in process of time, by a general rise in prices. It may do so gradually and imperceptibly at first; in the hourly variations of prices, it may not, perhaps, be perceived at first; just as when the waves are

breaking on the shore, it is impossible to tell whether the great tide is advancing or receding; but if it continues for any length of time, all traders begin to feel it instinctively. It is impossible, perhaps, to point out the precise influence in any particular transaction; but yet it makes itself felt in commercial operations, by a general rise in prices. The fact is, that when the operation was done, and the production exposed for sale, it was expected and calculated that a certain portion of currency would be appropriated to its purchase. But if people do not want the article, that portion of currency is not appropriated to its purchase; the producer loses his capital, and the currency remains in circulation; and the increased quantity of it gradually enters into the prices of other commodities, aggravating them and swelling them up. Now, when this is the case—when the currency is made of a material which has universal value, nature herself provides the remedy. When commodities rise in price in this country beyond their prices in foreign countries, besides the cost of transporting them here, they will be imported, and the extra quantity thrown upon the market diminishes their price, both by altering the ratio of supply and demand, as well as by removing the quantity of currency necessary to pay for them, from circulation, until the general equilibrium is again restored between commodities, currency, and what it represents. But if the currency be made of a material which has only a local value, like paper, this great restoring process of nature cannot take place. The quantity of currency remains the same, while the debt it represents is diminished. The consequence is a general diminution in the value of the whole currency—all that portion of the currency which has universal value is driven out of circulation—then follows a great rise in the market price of bullion, and as a necessary consequence, a fall in the foreign exchanges.

56. The preceding observations enable us to affix a definite meaning to an expression which is very common in all currency discussions, namely, *over-issues*. We have never seen any attempt to define what an over-issue is, and yet it is a phrase in constant use. Now, over-issues in general must consist of specific instances of over-issue in particular cases. Now, from the preceding considerations, the sense we affix to the expression "over-issue," is an advance made upon an unsuccessful operation, or the "purchase of a bad debt." Every quantity of currency advanced to promote an unsuccessful operation, or which purchases a bad debt, alters the proportion between the currency and the debt it represents. Each specific instance, then, of such an operation is an "over-issue," and the expression "over-issue" or "excessive issue" has no other meaning.

57. The foregoing considerations also shew the fallacy of the expression "good bills." In a banker's sense, a "good bill" means simply a bill which is duly paid by the proper party at maturity. It is not the smallest consequence to him whether the transaction out of which it originated is a profit or a loss to the person who incurred the obligation, as long as he is paid. But if the expression "good bill" be taken in a more extended and philosophical sense, to denote a bill upon which it is safe to issue currency, it is a very different matter indeed; for then a "good

bill" can only mean one generated by a successful operation. And these views are entirely borne out by the course of the Bank of England and the country banks subsequent to the Bullion Report. It was contemptuously rejected by Parliament, and what was the consequence? The years which followed it were those of excessive speculation in all branches of commerce, which it is well known were followed by immense losses, and the paper currency, which was issued to advance these unsuccessful operations kept continually falling to a heavier discount, until an immense destruction of these currency issuers took place in 1816, and the quantity of the paper currency that was thus destroyed, raised the value of the remainder to par, or within a very small fraction of it.

58. The preceding considerations, too, shew the excessive danger of making the *Wealth of Nations* a text book of Political Economy at the present day, by those who have not followed minutely the stream of discussion since it was published. The chapter, from which this theory is taken, has always been referred to as one of conspicuous excellence in that work, and yet if it be examined with that critical minuteness which a work of science demands, it will be found that its eminent author had never made himself master of the details of Banking, and that it contains two theories which are inconsistent with each other, and both of which are erroneous.

On the objections of Mr. James Deacon Hume, and Mr. Tooke to certain allegations in the Bullion Report.

59. The Bullion Report called forth clouds of hostile pamphlets, which stoutly denied the fact of the depreciation of the Bank Note. These we shall pass over without notice, because the reasoning of the Report on its main point, was so conclusive, that when fairly weighed by competent and impartial men, it was sure to come triumphant out of the discussion. This is just what happened. In 1811, the immense majority of the commercial world rejected it, in 1819, the whole commercial world adopted it, with scarcely a dissentient voice. The main fact, therefore, of the depreciation of the Bank Note is now acknowledged to have been proved beyond cavil or dispute.

But two eminent Economists who are thoroughly attached to its general principles, namely Mr. James Deacon Hume and Mr Tooke, have brought objections of a very grave character against some of its assertions, and as these objections are well founded, we must state them.

60. In the speech of Mr. Horner, introducing the resolutions founded on the Bullion Report in the House of Commons, he maintained that corn was the best measure of Value. (HORNER.) When therefore he saw the extraordinary price to which corn had reached in 1810, and 1811, he assumed that as a convincing proof of the depreciation of the currency, in addition to the rise in the market, or paper, price of gold bullion. And without enquiry, as we have seen above, the Report assumes that a depreciation of the currency would cause the price of all commodities to rise. The framers of the Bullion Report looking only at the prices of corn and meat, found that they had greatly risen, and they assume, and state, that the prices of *all* commodities had risen.

61. Now there was no evidence adduced on that point. There was no general inquiry made into the prices of *all* commodities, and Mr. Hume and Mr. Tooke, upon inquiry into the facts of the case, have satisfactorily proved that the statement is wholly unfounded. Mr. Hume, to whom so many practical economical reforms are due, (HUME, JAMES DEACON,) addressed several letters under the signature of H. B. T. to the *Morning Chronicle*, in the winter of 1833-34, which have been republished in his recent memoirs by Mr. Badham. One of these (*Life*, p. 99,) touches upon the question of depreciation. "It is a most extraordinary thing that the people of England should have so strangely mystified themselves on the subject, as to have imbibed a general impression, that all things were dear during the time that gold was dear; for there never was a greater mistake, and yet no man speaks ten sentences upon the *currency question* without talking of the high 'war prices' as applicable to all commodities. Some descriptions of goods were certainly exceedingly dear; but then others were most oppressively cheap; and the characteristic line to be drawn between them will be found to be a very curious one, when we come to examine the distinction with reference to the question at issue." And Mr. Tooke, in Vol. IV p. 113 of his invaluable *History of Prices*, gives a table of the prices of a long list of articles, which had immensely fallen in 1811, from what they had been in several preceding years. How then, say these excellent writers, can the Bullion Report assert that the prices of all commodities had risen in the face of the undoubted fact that an immensely large list had oppressively fallen? And by which class of articles are we to judge of the depreciation?

62. The objection to the assertion of the Bullion Report is unanswerable, and yet it is not a conclusive answer to the principles of the Report. The reply is obvious—granting that the nominal or paper price of these articles had fallen, still if the currency had not been depreciated, the price would have fallen still lower. Even in the depressed state in which they were, their prices were still above their proper level.

63. But the fact is, the error lay with the Bullion Report in mixing up two distinct tests of the depreciation of the currency, one of which is extremely simple and perfectly conclusive; but the other is extremely complicated, and by no means conclusive. The variations of the prices of commodities are so complex, and are influenced by so many obscure causes, that except in very extreme cases, (like those of the French Assignats, and the American continental money) it is a very dangerous argument indeed to draw any conclusion as to the depreciation of a paper currency from the price of commodities in the first instance.

64. In fact, the Bullion Report lays itself open to a retort from those who held the general opinion then held, and expressed by Mr. Chambers, who said that he did not consider gold a fairer standard to estimate the value of the bank-note than indigo or broadcloth, or any other commodity.

65. But the real criterion in the case, and the only one on which certain reliance can be placed, was well expressed by Mr. Marshall before the

Irish Exchange Committee in 1804 (*BANKING IN IRELAND*, § 355). "*Bank-notes are issued as a promise to be equal to gold currency, and they must follow all the variations of the value of gold, par passu, whatever they are.*"

66. Hence the Bullion Report should have confined itself to the establishment of the fact of the difference in the paper, and the money, price of gold bullion. And the next point should have been to ascertain whether there was a difference in the prices of commodities generally, throughout the country, between payments made in paper or gold. These are the real criteria on the subject; and there was abundant evidence brought forward in the debate on the report, that in the sale of commodities generally, there was then actually existing a difference between the paper and the money price. The whole force of the evidence should have been thrown on that point, and if this had been shown, as it undoubtedly might, it would have proved beyond cavil and dispute the fact of the depreciation.

Does the Bank Act of 1844 carry out, or is it in accordance with, the principles of the Bullion Report?

67. We shall now investigate a question of the utmost importance. Every one knows that the supporters of the Bank Act of 1844 strenuously maintain that it is the complement of the Act of 1819, and in strict accordance with the principles of the Bullion Report. We shall now endeavour to estimate the correctness of this assertion.

68. We need scarcely remind our readers that the Bank Act of 1844 strictly limits the power of issue of the Bank to £14,000,000 (since slightly augmented in consequence of the discontinuance of other issuing banks), together with an equal quantity of notes to the bullion in its possession. It thus specially prohibits any excess beyond that amount under any circumstances whatever; and though the amount no doubt varies, it is strictly limited.

69. Is this in accordance with the principles of the Bullion Report?

There is no one who has read the preceding analysis, but can fail to see that it is in diametrical opposition to several of its fundamental doctrines.

I. The Bullion Report, after discussing the two most important commercial crises which had occurred before its time, namely, those of 1793 and 1797, declares its opinion that the excessive limitation of discounts at those times greatly aggravated the distress, and says that in certain crises to which our paper credit is exposed, an *enlargement of accommodation* is the true remedy, and that too severe a contraction may lead to general ruin.

In the crisis of 1825, this very severe contraction was attempted, and the country was just on the brink of general ruin, when the Bank enlarged its accommodation, and the country was saved.

The Bank Act of 1844 strictly prohibits this enlarged accommodation in times of commercial crisis.

In 1847 there was a great commercial crisis. At last, it was felt that if the Act of 1844 was not set aside, general ruin would follow. The Act was set aside, an enlarged accommodation

took place, in accordance with the doctrine of the Bullion Report, and the commercial world was preserved from ruin.

In the still greater crisis of 1857, it was again felt that the maintenance of the Act of 1844 for twenty-four hours longer would have brought universal ruin on the commercial world; it was again set aside, and the doctrine of the Bullion Report again reverted to.

Is the Bank Act of 1844 in accordance with the doctrine of the Bullion Report?

70. II. The Bullion Report declares that the mere numerical amount of notes in circulation at any time is no criterion whether the notes are excessive, or not.

The theory of the supporters of the Act is, that the notes in circulation ought to be exactly equal to what the gold coin would be if there were no notes, and any quantity above that is an excess and a depreciation of the currency.

Is this principle of the supporters of the Act in accordance with the principles of the Bullion Report?

71. III. The Bullion Report declares that the sole criterion of the depreciation of the paper currency is to be found in the price of gold bullion, and in the state of the foreign exchanges.

According to the supporters of the Bank Act, the true criterion is whether the paper exceeds the quantity of coin it displaces.

Is the theory of the supporters of the Bank Act in accordance with the doctrine of the Bullion Report?

72. IV. It was proposed as a remedy to the Bullion Committee, that a positive limit should be placed on the issues of the Bank. The Bullion Report specially condemns any positive limitation of the issues.

The Bank Act of 1844 specially limits the issues of the Bank.

Does the Bank Act of 1844 coincide with the principles of the Bullion Report?

73. On these fundamental points, therefore, the Bank Act of 1844 is in direct opposition to the principles of the Bullion Report, and we think that ample experience has proved the greatly superior wisdom of the Bullion Report.

74. The following principles are not only maintained in the Bullion Report, but were adopted by all the most eminent authorities of the period, and especially by the framers of the Act of 1819; and, we believe, contain the true principles of the subject.

I. That there are periods of commercial crisis when an enlarged accommodation is the true remedy.

II. That at such periods an absolute limit of the issues of the Bank greatly aggravates the crisis, and if continued beyond a certain time, will certainly bring on universal ruin.

III. That the numerical amount of notes in circulation is no absolute criterion of their excess.

IV. That the true criterion of the paper currency is to be found in the state of the foreign exchanges and in the price of gold bullion.

V. We have shewn that it was the neglect of this latter law that has been one of the main causes of those dreadful commercial crises in this country. (CRISIS, COMMERCIAL.)

VI. That the true controlling power of the paper currency, or credit, is to be found in the

RATE OF DISCOUNT, which is to be adjusted to the state of the foreign exchanges. We have shewn under DISCOUNT, by abundant historical evidence, that it is capable and effectual in doing so.

BUNN, THOMAS.

Remarks on the necessity and the means of extinguishing a large portion of the National Debt. Bath, 1828.

BURAT, JULES. A civil engineer, born at Paris. He has long been a contributor to commercial periodicals—the *Journal de Commerce*, the *Dictionnaire de Commerce et des Marchandises*, and to the *Revue d'Economie Politique*, published by Theodore Fx, from 1833 to 1836.

Exposition de l'Industrie Française, année 1844, description méthodique accompagnée d'un grand nombre de planches, et de vignettes, de la liste des récompenses, et d'un historique sur les expositions. Paris, 1845.

Die Wechselmatrikel des Königlich bayerischen Wechselgerichte Bamberg. Bamberg, 1845.

BURGES, TRISTRAM.

Address to the Rhode Island Society for the encouragement of domestic industry. Providence, 1842.

BURKE, EDMUND, is distinguished as the first British statesman who had any knowledge of Political Economy. He was born in Dublin on the 12th of January, 1729 or 1730, the son of an attorney in large practice. Of a family of fifteen, only four survived infancy. As Edmund's health was delicate, and shewed a tendency to consumption, he was sent out of town to Castle Town Roche, near the castle of Spenser, to whom his mother claimed a relationship. At 12 years of age, he was removed to Ballitore, about 30 miles from Dublin, where he was placed at a school kept by an eminent quaker named Shackleton. Burke was early distinguished for industry, power of memory, and facility of acquisition,

and he shewed that warmth of heart which so nobly distinguished him afterwards. He formed a warm attachment with the son of his schoolmaster, and continued it till his death in 1792.

In 1744, he entered Trinity College, Dublin, where he continued the same industrious course as at school; and though he is not said to have been distinguished as a classical scholar, he gave much of his time to the study of history, moral and political philosophy, and metaphysics. He also took a leading part in the Historical Society, which was then founded, and like its counterpart, the Speculative Society in Edinburgh, numbered amongst its members many of the most distinguished men of the day.

In 1750, he came to London, and entered himself as a student at the Middle Temple, as his father had set his heart upon his being distinguished as an English lawyer. He still continued as industrious as ever; but he pursued too wide a range of study to be consistent with that exclusive devotion to the law which is indispensable to success at the bar. He seems soon to have abandoned the idea of following it up as a profession, to his father's great annoyance.

In 1756, he published anonymously his *Vindication of Natural Society*, a satirical attack on modern society, in the manner of Bolingbroke. The parody was so well done, that it is said several men of eminence were deceived, and took it really to be written by Bolingbroke. In the same year he published his *Inquiry into the origin of our Ideas of the Sublime and Beautiful*. The application he bestowed in producing these works injured his health, and he went to Bath to recruit. He was received into the house of a countryman of his own, Dr. Nugent, whose daughter he afterwards married.

In 1757, he contemplated emigrating to America, but fortunately, was diverted from his purpose. His writings began to make him known, and in 1758, he was engaged by Dodsley to superintend the publication of the Annual Register then commenced, and his rising fame procured for him the friendship of Johnson, Lord Lyttleton, Jenyns, Reynolds, and Adam Smith.

In 1761, through the influence of Lord Charlemont, he was made private Secretary to "single speech" Hamilton, the Secretary for Ireland, who, in 1763, obtained a pension of £300 a year for him on the Irish establishment. But he did not long enjoy it. Hamilton gave him very soon to understand that he considered him as bound to him for life. Burke was of far too independent a nature to submit to this, and resigned his pension, and a complete rupture followed between them.

At this period Burke's goodness of heart displayed itself in a very striking manner. Having discovered in a poor Irish lad named Barry, what he considered great promise of artistic talent, Burke, though in very straitened circumstances himself, took upon himself the charge of his education, and sent him to Rome, where he remained for several years studying, without earning a farthing for himself. On his return Burke did everything he could to advance him.

The poet Crabbe, too, owed his advance entirely to Burke. The unfortunate young man, being in the last state of destitution, addressed manuscripts of his poems to several of the leading statesmen of

the day, and met with nothing but neglect. In a happy moment he sent them to Burke, with a modest note stating his distress, and the repulse he had met with. Burke though then engaged in the very keenest political contest, immediately attended to the distressed poet. He read and approved the poem, and sent for the author, and took him into his own house, and maintained him until he was able to turn his talents to some account. He selected and corrected his verses, and introduced him to Reynolds, Johnson, and other eminent persons. His poems were published under Burke's patronage in 1782, and Crabbe subsequently got several livings through his influence. These deeds deserve to be recorded to shew the nature of the man.

Burke, having thus quarreled with Hamilton, returned to London, and became an assiduous attendant in the gallery of the House of Commons, and particularly studied Political Economy.

At length the way was opened for him to reap the reward of so much toil. In July, 1765, the Grenville administration came to an end. Lord Rockingham was made premier, and he immediately appointed Burke as his private secretary. Lord Verney returned him to Parliament for his nomination borough of Wendover.

In January, 1766, he made his first speech on behalf of America. His success in the House was immediate and immense. All the Parliamentary leaders were amazed. And his reputation rose higher and higher after every address. In July, 1766, the Rockingham administration came to an end; and Chatham, who succeeded him, was anxious to offer Burke a place in the new ministry; but he adhered to his political friends, and went out of the way to avoid the temptation.

In 1767, he purchased an estate of 600 acres in Buckinghamshire, for which he paid £20,000. There is no doubt that Lord Rockingham advanced him part of the purchase-money, and at his death the bond was found cancelled. Although there does not seem to have been anything improper in this transaction, it was always made a subject of much malignant censure by his enemies.

In 1768, Mr. Grenville either wrote, or caused to be written, a defence of Lord Bute's administration, in a pamphlet entitled, *The present State of the Nation*. Burke wrote an answer to it, entitled, *Observations on a late Pamphlet, entitled, &c.*, in which he shewed how completely he had mastered the subjects of commerce and finance.

In 1770, he published a most admirable pamphlet, called *Thoughts on the present Discontents*.

In 1771, he was appointed agent to the State of New York, with a salary of about £1,000 a year. During the American War he uniformly and strenuously opposed the suicidal ministerial policy. Many of his most splendid efforts were made in this cause. The course he took led to a difference with his patron Lord Verney, and he resigned his seat for Wendover. Another was provided for him at Malton; but after he had been elected for Malton, and on the sixth day of the poll at Bristol, a deputation from that city arrived, and invited him to stand. He immediately decided to accept the offer, and travelled day and night till he reached it, and was returned on the 27th day of the poll.

In 1776-7, the Rockingham party, seeing all their efforts fruitless to stem the ministerial and

national phrensy on the American war, set the inexcusable example of absenting themselves from Parliament. This course, though unfortunately imitated by Fox and the Whig party several years later in the revolutionary war, has now been justly and universally condemned.

In 1788, his Free Trade views led him to support the relaxation of the impediments upon the trade with Ireland; but his narrow-minded and selfish constituents took deep offence at this, as well as his enlightened advocacy of the claims of the Roman Catholics, and, on the dissolution of 1780, rejected him. He then took refuge at Malton, and sat for it during the remainder of his Parliamentary career.

In 1779, Burke brought forward a great plan of Economical Reform. Never before, probably, had a matter of dry detail been adorned with such eloquence; and it even gave no offence to the very persons whose places were attacked. But, speaking from the opposition benches, such a plan had no chance of success. The speech, however, created the warmest admiration, especially in Johnson and Dunning. In 1782 the Rockingham party were restored to power, and Burke was made paymaster of the forces, then the most lucrative office in the government, and made a privy councillor. In this position he carried a considerable portion of his measure of economical reform, though of course it was considerably curtailed.

The sudden death of Lord Rockingham broke up his party, and Burke assumed his old place in opposition till the ill-starred coalition of Fox and Lord North, when he was again made paymaster. The India bill, which sealed the fate of that political error, is said to have been a plan of Burke's. The skilful tactics of Pitt scattered his enemies to the winds; and the generation who had listened with wonder and admiration to Burke were exiled for ever from Parliament. The benches were crowded with serried ranks of fox-hunting squires who came not to listen to Burke, but to vote with Pitt.

In 1784, the University of Glasgow elected him Lord Rector.

In 1786, Burke entered on the most memorable event of his life—the prosecution of Warren Hastings—and in 1789 the French Revolution broke out, which two events almost exclusively absorbed his attention for the rest of his life. For neither of these is there any room for judgment here. There can be no doubt of his intense sincerity in both. The latter, indeed, was pursued with a vehemence and frenzy which totally severed him from the affections of a lifetime, and was indeed scarcely consistent with rationality.

In 1790, his *Reflections on the Revolution in France* was published, the most gorgeous of all his writings. In a single year 30,000 copies were sold. Most of the crowned heads in Europe loaded him with favors and presents. The Universities were equally enthusiastic. To this subject the greater part of his future writings were devoted; and they bore no remote analogy to the pictures of Turner in the latest period of his life. They were nothing more than pieces of gorgeous coloring, from which all traces of the reality of nature had vanished.

The political connection between Burke and the party he had acted with all his life had been

severed in the progress of the French Revolution, and even his personal friendships were dissolved. In December, 1792, Burke, in a climax of feeling, formally crossed the floor of the House, and took his seat by Pitt. But even Pitt was far too lukewarm for Burke.

On the 24th September, 1795, a pension of £1,200 a year was conferred on him, which was antedated to 1793; and on the 24th October, 1795, two others, amounting to £2,500, for three lives, and antedated to July, 1793. Of all men who ever received a pension, few were better deserving of it than Burke; but it is sad to think that it was given him, not for his glorious efforts to stem the national madness about the American War, but for the most mischievous part of his whole career, and the one which has met with the unanimous condemnation of every competent judge since his time.

Further honors were intended for him. He was going to have been made a peer, but he soon lost all tie to earthly greatness. In 1796, he was utterly broken by the loss of his son, a man certainly of talent, whom he regarded almost with idolatry, and whom his excitable imagination had invested with a genius which, he fondly hoped, would one day eclipse his own. The heart-broken father was not long in following. After trying Bath for four months, without benefit, he returned to Beaconsfield to die; and in July, 1797, there were laid in the village church, remains which had contained one of the warmest hearts, the most gorgeous imaginations, the most ardent spirits, and the most capacious intellects that ever adorned humanity.

Observations on a late publication intitled, "The present State of the Nation." London, 1769.

This abounds with the most valuable economical details of the condition of the nation. He shews in it, how clearly he saw the fallacy of the Balance of Trade. "On this state the reader will observe that I take the *imports from*, and not the *exports to*, these conquests, as the measure of the advantages which we derived from them."—"So that our imports from them, and not our export, ought always to be considered as their true value; and this corrective ought to be applied to all general balances of our trade which are formed on the ordinary principles." In fact, this is exactly in accordance with the fundamental principles of the system of Political Economy we are endeavouring to enforce, that it is not the labor which gives value to any product but the quantity of things that can be had in exchange for it. Thus the consequences of fundamental principles appear in cases where they are least expected. And this is in direct contradiction to the principles of the second school of Political Economy which held that labor was the cause of value. (FOREIGN TRADE: RICARDO.)

He also clearly saw the rotten state of the finances of France, and utters a prophecy which was fully verified twenty years later. "Indeed, under such extreme straitness and distraction labours the whole body of their finances, so far does their charge outrun their supply in every particular, that no man, I believe, who has considered their affairs with any degree of attention or information, but must hourly look for some extraordinary convulsion in that whole system; the

effect of which on France, and even on all Europe, it is difficult to conjecture."

Speech on American Taxation in 1774.

Two letters to Gentlemen in the City of Bristol on the Bills depending in Parliament relative to the trade of Ireland. 1778.

In these letters, Burke's enlarged mind appears well. The miserable jealousy of the Bristol traders wanted to keep down the Irish commerce. Burke said, "But your profit and theirs must coincide. Beggary and bankruptcy are not the circumstances which invite to an intercourse with that, or any other country; and I believe it will be found invariably true that the superfluities of a rich nation furnish a better object of trade than the necessities of a poor one. It is the interest of the commercial world that wealth should be found everywhere." These may sound like truisms now, but they were paradoxes then.

Speech on presenting to the House of Commons a plan for the better security of the independence of Parliament, and the economical reformation of the civil and other establishments. Feb., 1780.

This abounds with valuable details of the economical state of the nation.

Thoughts and details on scarcity. 1795.

An admirable tract full of the soundest economical doctrine.

Besides these tracts, which are specially on economical subjects, numerous other important doctrines incidentally occur. Among others we may mention that in the *Reflections on the Revolution in France*, where he sees that money is general credit. He denounces the assignats which were substituted "in lieu of the two great recognized species that represent the lasting conventional credit of mankind."

BURN, JAMES DAWSON.

Life Assurance; an historical and statistical account of the population, the law of mortality, and the different systems of Life Assurance. London, 1849.

BURTON, JOHN HILL. The son of an officer, was educated for the Scotch bar, and passed advocate in 1831. He very early became a zealous supporter of Free Trade doctrines, and being

on friendly relations with Colonel (now General) Thompson, contributed to the Westminster Review in 1833. After that he continued to support them warmly in the press, and became acquainted with Mr. Cobden and the Manchester party in 1838, when they were just commencing that apparently hopeless agitation, which, from a remarkable combination of circumstances, received so magnificent a triumph in 1846. Besides several works on professional subjects, Mr. Burton superintended the publication of Jeremy Bentham's works, to which he has prefixed an introduction, containing an estimate of his system and his merits. He has also published in general literature, *The Life and Correspondence of David Hume*, 2 vols., 1846. *The Lives of Lord Lovat and Duncan Forbes of Culloden*, 1847. *Narratives of Criminal Trials in Scotland*, 1852. *The History of Scotland from the Revolution to the extinction of the Jacobite insurrection, 1688—1748*, 2 vols., 1853.

In searching among the cellars of the Advocate's Library in Edinburgh, Mr. Burton found a chest containing all the books and accounts relating to the too famous Darien scheme, the Mississippi plan of Scotland. A selection of these were published by the Bannatyne Club, at his suggestion, in 1849.

In 1854, he was appointed Secretary to the Prison Board of Scotland.

Political and Social Economy, its practical applications, 1849.

The outbreak of the French revolution in 1848, gave a considerable impulse to the spread of Socialistic principles among the working classes in this country. This work was written to counteract the mischievous tendency of such doctrines, and is essentially popular in its character. It very properly avoids dealing much with abstract doctrines, but explains the actual working of economic principles in society. Nevertheless, although it is professedly popular, the author cannot help occasionally noticing abstract principles, and on such occasions we are happy to see that Mr. Burton's doctrines almost invariably coincide with those of this work.

The first two chapters are an excellent popular exposition of "Labor;" and at p. 23, he takes the opportunity of shewing the fallacy of the very generally received doctrine, that labor is the measure of value. "Labor is a thing too varied, and the distinctions between its different aspects are of too subtle a character, to admit of its being made an actual measure of value. Speaking of the labor that seems to be merely mechanical, shall we measure by the locksmith, the machine maker, and the chaser of the precious metals, or shall we measure by the ploughman, the handloom weaver, and the net maker? The former class make sums varying from 3s. to 15s. a day, and even more; the latter keep pretty close to the level of 1s. When we come to the field of intellectual labor, we find still wider differences, and soon see that it is impossible to establish labor as a practical measure. To speak of a thing being worth a day's labor generally, is, adopting the vulgar but discarded pecuniary measure of value, to speak of it as of some value between 1s. and 15s. Nor shall we be more successful if we take the produce of the labor. Who can compare the relative worth of ploughing a field, the weaving of a web, and

the making of a watch, *otherwise than by the sums they will respectively bring?* Thus, practically, before it can itself serve as a measure, labor must be meted out by that other measure of value, which is considered so uncertain—money." This is evidently the very doctrine of Aristotle; and is the very point which we maintain (LABOR; VALUE), that it is not the labor which gives value to a product, but the value of the product which proves the value of the labor; and is the complete refutation of the doctrines of Ricardo, De Quincey, and McCulloch.

Mr Burton then describes the decaying condition of those laborers who set themselves against the irresistible progress of invention and improvement. The recent unhappy strikes in London, prove but too well, how greatly the doctrines of this chapter have still need to be inculcated on the working classes.

Mr. Burton then goes on to shew the error of the doctrine that the field of productiveness is limited, and points out that it is the multiplication of the *wants* of men that calls forth the increased energies of the industrial population to create something to gratify those wants. His conception of *productive labor* is entirely in accordance with our own, (CAPITAL; PRODUCTION.) At p. 51, he says, "We lately found the editor of a newspaper calling his own occupation productive, because he aided in producing weekly a broad sheet of tangible printed paper, while he maintained that a great public singer was an unproductive laborer. A musical enthusiast, on the other hand, who took an hour to read the newspaper, and did not remember many hours afterwards, when it had gone to light the household fires, the politics he had read in it, said that the public singer supplied him with ideas, and products of science, and pleasurable emotions, that would last him all his life. *Whatever society pays for, and ought to pay for, may fairly be considered as productive labor for our present purpose*; for though there are no tangible objects created by it, yet it contributes in the end to the increase of production. Whatever tends to organize and civilize mankind is thus productive; and it would be difficult to decide what proportion of the majestic fruits of civilization, which lie everywhere around us, we owe to the judges, who by their strict enforcement of the law, have protected private liberty and property from oppression and plunder, and to the instructors of youth, who have disciplined our citizens to fulfil their respective parts in life."

This is the very doctrine we support. And in his chapter on Capital, Mr. Burton, in strict accordance with the preceding extract, fully acknowledges the existence of incorporeal capital. "Let us remember that capital is not limited to the collections of thousands of pounds invested by the monied aristocracy; it exists wherever man possesses facilities from past labor, whether exercised by himself, or by those who allow him to have the benefit of it, for laboring to better effect in future. A carpenter's well equipped tool-chest is capital, producing, when combined with his labor, a far higher per centage than the sum it cost would procure for an idle man of fortune. *Education, skill, even good principles, are capital*; they are something that has been made by the individual who enjoys them, or by others, who have

communicated their benefit to him. The savage, when he has made a bow, and fitted it with a string of twisted grass, and has got a quiver of arrows made with reeds and pointed with ebony, is a capitalist. Few could be in a better position for estimating the efficacy of capital than a New Zealander, who, depending on his native bones and muscles for obtaining food, finds himself suddenly possessed of a bow and a quiver of arrows. All that is saved from labor past, is an accelerator of labor future. The saving from past labor, that enables a father to train his son to a skilled profession, is capital, though he should never give that son a farthing in the shape of money. If the father can afford the son food for a few years, that he may gain strength for bodily labor, this also is capital. Everything that endows the human being with more than the naked forked animal, which man has been described to be, is capital. It is a great advantage to any one to have capital made to his hand—it is the uniformly acknowledged felicity of possessing a fortune; but there is always a person who has created the capital, or made the fortune: and in answer to all statements, that the quantity of productive labor depends on the amount of capital, we have to set forth the existence of the productive labor that has created the capital."

This, so far as it goes, is perfectly accurate. We have shewn that *not only past labor*, which we may call positive, may be used as capital, but also its opposite, or *future labor*, which is a negative, may also be used as capital.

Two chapters on the "Working Classes" contain much excellent advice about strikes, and the condition and duties of the working classes to themselves.

Mr. Burton then examines the duties of wealth and landed property, and discountenances the projects which some ardent writers have brought forwards, for transforming the country into peasant properties.

A chapter on "Population" successfully controverts several of the Malthusian doctrines, and shews the fallacy upon which several of them rest. (POPULATION.)

Mr. Burton then combats, in a commendable "spirit of pure hostility," the Socialist and Communist doctrines, of which he avows himself the uncompromising enemy in all shapes and forms.

The next chapters discuss "the limits of the function of the State" and "education." In the latter the author thinks that children, whose parents cannot afford it, should receive education at the public expense.

A discussion on "Pauperism and the Poor Laws" and "Emigration" conclude the work.

We have said that the above work is especially intended as a popular exposition of the subjects discussed in it. We have reason to believe that Mr. Burton meditates a more extensive work on a somewhat similar plan; we would earnestly urge on him to proceed with it while yet there is time.

Report on arrestment of Wages; the effect of abolishing imprisonment for small debts; and the practice of truck in Scotland. 1853.

This is a report prepared in obedience to the instructions of Lord Advocate Moncrieff, in 1853.

By the law of Scotland, a creditor may not only proceed against his debtor, but if he finds out any

person who holds any money or property of his debtor's, he may arrest it in his hands. This principle is unknown to English law, except in the city of London, where it is called "foreign attachment," and, we believe, in a few other places. It has, however, to some extent, been adopted in England recently. This facility for "arresting" money in the hands of a third person, before it comes into the hands of the debtor, has opened a door for a very wide extension of the credit system among the working classes in Scotland; and there is no doubt, in a great many instances, has enabled reckless and improvident men to obtain credit, where they never would otherwise have done so. The merits and demerits of this system, in a social point of view, have been fiercely contested. And, like in many other social questions, there is undoubtedly "much to be said on both sides." It appears, however, chiefly to prevail in the western counties of Scotland; and above all in Glasgow. In consequence of this system, the legal processes taken out against working persons are enormous. In Glasgow alone, in 1863, they were 80,000 annually. No doubt much oppression occurred in individual instances, and the advantages of the system were much called in question.
